Workers from Europe became increasingly reluctant to come to the colonies because of the harsh life they would experience as recounted by other emigrants. To encourage more white workers to come to America, contract periods were shortened and land was offered as part of the freedom dues for many Europeans, including the Irish, who were not regarded in the same social category as those with English ancestry. This period initiated the Irish into a higher social category, separating them from blacks and Native Americans, who were increasingly thought of as the lowest elements in American society. The shortage of white workers and the inability or unwillingness to grant land to servants completing their contract also precipitated the buildup of black slave labor.

Slaves did mostly agricultural work. Women as well as men toiled in the fields; women also did domestic work: cooking, cleaning, spinning, and child rearing, including working as wet nurses. On larger plantations, slaves were divided into house servants and field hands, who were the majority on any plantation. Slave compensation was, of course, nil, and the basic necessities slaves received were mostly abominable. Housing was poor, usually without windows or flooring. The food was meager, consisting of starch and low-quality meat. Clothing—or cloth for the women to sew—was distributed once or twice year, with each adult receiving a pair of shoes that were usually the same for men and women and with children receiving no shoes until they could work in the field.

The American economy began to diversify more after 1720. In addition, artisanal indentured servants often left their respective trade to become independent farmers upon completing their contracts. The influence of these shifts trickled down to black slaves, enabling them to acquire more mechanical skills. Slave owners diversified the skills of their slaves to make up for seasonal slowdowns and inflationary periods. It was also not unusual for slave owners to rent out their slaves; this alternative was often very profitable for the owners.

The training of slaves as artisans was problematic for free white artisans. Most notably in the South where there were more blacks than in the North, skilled white workers complained that skilled black workers were competing for their jobs. By and large, this was true, especially in the towns. Legislation was enacted to restrict the hiring out of slaves and to prevent blacks from sharing in the income from their labor.

Despite the fact that businessmen working in tandem with the state developed a divisive strategy aimed at weakening attempts to formulate any sort of working class, black, white, and Native American workers still managed to form bonds. In the early colonial period, it was not uncommon for servants and slaves to work together to escape their lot. Punishment for those captured was harsh, usually hanging or immolation. But even for minor infractions, servants and slaves alike received lashings and beatings. Because of their impoverished nature, it was impossible to levy fines for most infractions.

The rapidly growing numbers of blacks in the South encouraged whites to enact strict legislation against slaves. In South Carolina, nearly two-thirds of their population was black, and in Virginia it was 50 percent. Whites lived in constant fear of slave uprisings. The gathering of blacks, even on Sundays, was severely limited, and when runaways were caught, slaves not involved in fleeing were also punished.

WOMEN

Women have been generally overlooked in research studies, even though women in the colonial and Revolutionary periods performed work both inside and outside the home. Barbara Mayer Wertheimer begins her chronicle of women workers by noting that Native American women were the first women to work in America. They were the first people known to grow corn and to produce maple sugar. Generally, in most tribes, they were responsible for agriculture and domestic work including child rearing. If it was not for these women, who shared their knowledge of the land, the earliest colonial settlers would not have survived.

The first settlers to America came from England in 1607, settling in what they called Jamestown. Shortly thereafter, large numbers of women were brought from England to keep the male settlers content and to populate the new colony. Originally, women were allotted land in similar fashion to male settlers, but this policy was halted because it impeded women's need, and perhaps even desire, to marry quickly.

The harsh colonial life was especially taxing to women. Women married young and bore many chil-

dren. They often died young, and their husbands usually sought to remarry quickly. Women who did not have their own family, land, or business were often supported by relatives. Referred to as "spinsters," they labored in the home, were given no privacy, and had no spending money. Widows in New York, however, organized themselves to protest their treatment by society, stating that they supported the government by paying taxes and carrying businesses.

Women maintained the household and reared the children. Husbands and sons usually ran the small businesses that sustained the early colonists, and wives and daughters often provided additional labor. The women, therefore, learned to shoe animals, work with metals, keep the books, and operate tools. Girls did not learn trades the way apprenticed boys did; their instruction was done in the home by helping family members.

Some women earned their living through the few professions that were allowed women. Keeping a tavern or inn was mostly a woman's business. Midwifery and doctoring were other professions in which women dominated, at least until the Revolutionary period. However, because women were not seen as equal in the eyes of the law, they had their own unique difficulties. A Maryland doctor named Katherine Hebden was unable to collect her payment for services rendered. Her husband had to take the case to court on the grounds that he was entitled to money owed him for work his wife had performed.

Labor Organizing

Unions, in the modern sense of the term, developed in the nineteenth century. In the colonial and early independence era, some workers formed mutual aid societies to provide death benefits to workers and other rudimentary services, but the organizations typically did not protest harsh conditions. Nor did they advocate politically or socially the improvement of worker rights.

The guild system that protected worker rights in Europe did not readily transfer to American society. Still, workers organized protests against government regulations that impinged on their survival and dignity on the job. Attempts were made in the colonial era to regulate the maximum level of wages and to fix prices for goods and services to prevent workers from earning more than necessary for subsistence.

Although there were certainly instances of labor disputes in colonial America, scholars continue to debate whether these disputes can be conflated to be equivalent to strikes. Undoubtedly, a number of individual work stoppages and demands for changes in the workplace, whether in compensation, hours, or treatment, flared up from time to time. However, strikes—the collective stoppage of work and services to obtain improvement in wages and working conditions—began at the end of the eighteenth century, as the unbridling of workers from their masters or slaveholders through the development of capitalism became pervasive, particularly in urban industrial areas. Thus, the strike is indelibly associated with capitalist social relations.

Various examples of early strikes are recorded by numerous sources. Thomas R. Brooks writes that America's first labor strike occurred in Philadelphia in 1786 by printers who "turned-out" to obtain a minimum wage of six dollars per week. Dulles and Dubofsky claim that the first recorded strike in U.S. labor history did not occur until 1799 by a group of organized cordwainers—shoemakers who work with Cordovan leather—in Philadelphia. After staying off the job for ten weeks, the cordwainers won a new contract from the master shoemakers.

In John R. Commons' comprehensive series, *History of Labour in the United States* (1918), David J. Saposs writes on the problem of distinguishing between strikes by master workmen and those by journeymen. The master workmen generally revolted against price regulation by public authorities, whereas the journeymen struck against employers to maintain wages. In the instance of the strike in 1786 by printers in Philadelphia, the printers were both merchants and laborers, so the "purity" of their strike, as a true workers' protest, becomes somewhat suspect. Brooks notes that black sweepers' refusal to work in Charlestown, South Carolina (present day Charleston), in 1761 might well constitute the first worker-led work stoppage.

Other labor disturbances in the colonial period include a mutiny of indentured servants and fishermen in 1636 off the coast of Maine, protesting the withholding of wages. In 1661, indentured servants in Virginia planned a rebellion. Officials in Maryland faced a public disturbance attended by workers in 1663. Protesting against their conditions, ship carpenters in 1675 issued a formal protest against their conditions. New York City recorded a work stoppage by licensed carters in 1677. Ordered to clean the streets of New York for 3 pence per cartload, they protested the pay and their treatment by the city as well. The carters protested their conditions again in 1684. Also in New

York, bakers stopped baking bread in 1741 and tailors stopped sewing in 1768. In 1768, indentured servants revolted in what is now Florida. That same year also saw a turnout by journeymen tailors in New York protesting their low wages and offering to perform their services for private employers.

During the Revolutionary period there were instances of strikes and disturbances, which were spurred by inflationary prices and declining purchasing power and, undoubtedly, encouraged by the rebellious nature of the times. In November 1778, journeymen printers in New York demanded and received pay increases. Similar protests were waged in 1779 by seamen in Philadelphia, shoemakers in New York in 1785, and journeymen printers in Philadelphia the following year.

The independence era also saw public debate about the inhumanity of the system of slavery. Prior to this time, abolitionist groups and individuals demanded cessation of slavery on moral grounds. The eighteenth century witnessed the development and questioning of the rights of citizens in general, and the question of slavery became part of that discussion. The hypocrisy of demanding full rights from the British while enslaving a significant number of their own was not lost to many colonialists. Indentured servitude had already begun waning, and after the war, slave importation ceased.

LABOR MOVEMENT 1790–1860

If there is a single development that marked the beginning of the antebellum labor movement, it occurred in 1827 when skilled artisans from across more than a dozen unions in Philadelphia organized that city's Mechanics' Union of Trade Associations (MUTA). As the preamble to its constitution announced, the organization aimed "to raise the mechanical and productive classes to that condition of true independence and equality which their practical skill and ingenuity, their immense utility to the nation, and their growing intelligence are beginning imperiously to demand." To be sure, collective action by skilled workers in the new American republic well predated the MUTA. In the quarter-century following the American Revolution, mechanics' institutes emerged to celebrate the productive role and promote the economic interests of their members, and to uphold such hallmarks of artisanship as the traditional apprenticeship system. Early craft unions such as the Federal Society of Journeymen Cordwainers (shoemakers) in Philadelphia (1794), appeared, and these in turn became vehicles for strikes.

Still, the MUTA represented a critical new departure and the next phase in the history of organized American labor—the nation's first citywide confederation of trade unions. This innovation, together with Working Men's parties, local trade unions, cooperative workshops, and (in the 1850s) national unions, comprised the basic institutional landscape of the antebellum labor movement and, at least in terms of trade unionism, of the American labor movement ever since.

SOCIOECONOMIC ORIGINS OF THE MOVEMENT

Not quite forty years before the founding of the Philadelphia confederation, artisans in Boston, New York, Philadelphia, and elsewhere had paraded in commemoration of the ratification by their respective states of the new Federal Constitution (1788), which they believed would enhance their economic prospects by creating a central government able to stimulate American industry and thus national prosperity. Their elaborate floats celebrated not only the new federal edifice but also their deep-felt pride of place in it—their essential role as the nation's "bone and sinew" and, related intimately to that, their claim, if as yet not fully realized, to independence and equality. By the age of Jackson, however, growing numbers of skilled white workingmen, like the members of Philadelphia's central labor union, were building not floats but a labor movement, were declaring not the ascendancy but the degradation and decline of workingmen and labor in republican America. These tightly intertwined institutional and ideological developments would, however unevenly and sporadically, persist, broaden, and deepen between the late 1820s and the Civil War.

Behind these developments lay a profound and ongoing transformation of work wrought by the market revolution of the late eighteenth and early nineteenth centuries (c. 1780–1830). With the growth of markets, itself the product of revolutionary changes in transportation (first roads and turnpikes, then canals, then railroads), more and more Americans were drawn more deeply and regularly into commercial exchanges and contractual relationships. For craftsmen, as for all free adult white Americans, this brought liberating choice and opportunity, but also increasing social inequality. Thus, ambitious master craftsmen with adequate capital could, and did, join the growing ranks of entrepreneurial merchant capitalist employers who sought financial gain and upward mobility by manufacturing a particular good for an extensive market. In most cases (printing and textiles were the notable exceptions), this involved for most of the period not mechanization but rather the "sweated" sub-

FACTORY RULES FROM THE HANDBOOK TO LOWELL 1848

The "Lowell System," imposed on young women working in a textile mill for Frances Cabot Lowell, a manufacturer, became a prototype for many workers employed in the embryonic manufacturing industries of mid-nineteenth-century America. Under the harsh system, "mill girls" worked long hours under unsafe conditions for low pay.

REGULATIONS TO BE OBSERVED by all persons employed in the factories of the Hamilton Manufacturing Company. The overseers are to be always in their rooms at the starting of the mill, and not absent unnecessarily during working hours. They are to see that all those employed in their rooms, are in their places in due season, and keep a correct account of their time and work. They may grant leave of absence to those employed under them, when they have spare hands to supply their places, and not otherwise, except in cases of absolute necessity.

All persons in the employ of the Hamilton Manufacturing Company, are to observe the regulations of the room where they are employed. They are not to be absent from their work without the consent of the overseer, except in cases of sickness, and then they are to send him word of the cause of their absence. They are to board in one of the houses of the company and give information at the counting room, where they board, when they begin, or, whenever they change their boarding place; and are to observe the regulations of their boarding-house.

Those intending to leave the employment of the company, are to give at least two weeks' notice thereof to their overseer.

All persons entering into the employment of the company, are considered as engaged for twelve months, and those who leave sooner, or do not comply with all these regulations, will not be entitled to a regular discharge.

The company will not employ any one who is habitually absent from public worship on the Sabbath, or known to be guilty of immorality.

A physician will attend once in every month at the counting-room, to vaccinate all who may need it, free of expense.

Any one who shall take from the mills or the yard, any yarn, cloth or other article belonging to the company, will be considered guilty of stealing and be liable to prosecution.

Payment will be made monthly, including board and wages. The accounts will be made up to the last Saturday but one in every month, and paid in the course of the following week.

These regulations are considered part of the contract, with which all persons entering into the employment of the Hamilton Manufacturing Company, engage to comply.

JOHN AVERY, Agent.

division of skilled manual work among dependent journeymen (now the "employed") concentrated in central workshops and paid low wages.

Under these exploitative conditions, journeymen found it increasingly difficult, if not impossible, to follow the traditional artisanal path to master status and the "competency," or modest independent means, that status conferred. Nor could the traditional apprentice system survive cost-cutting masters–employers who turned it into a source of cheap child labor. In short, even as the market revolution enabled some craftsmen (well-situated masters in particular) to prosper, the handicrafts—both as a system of production and as a social relationship that bound journeymen and masters together around historically mutual interests—were undergoing "bastardization," and artisans were in turn bifurcating into bosses and wageworkers. By the late antebellum period, a large and permanent wage-earning working class had emerged in the United States.

Journeymen in the reorganized handicrafts were neither the only wageworkers in the industrial sector nor the only workers to engage in collective labor protest. The emerging factory system—symbolized most famously to contemporaries by the water-powered textile mills of Lowell, Massachusetts—provided a second, if less common, path to wagework and a setting for employer–employee conflict. By mid-century, unskilled laborers like dockworkers and those who built the canals and railroads essential to the market revolution formed another permanent segment of the new wage-earning working class and engaged in strikes against employers.

Still, in composition and ideology, the antebellum labor movement was dominated by skilled and semiskilled workingmen experiencing and resisting their

own proletarianization. If not all labor protest was their protest, it was through their organized collective actions, as well as their ideas, that the labor movement largely arose and developed.

Ideology and Aims

Antebellum labor activists articulated a mobilizing ideology focused on both the exploitation of artisanal labor and, more broadly, the growing social inequality attendant on the market revolution and industrialization. Refashioning the republicanism of the American Revolution, they linked the progress (and thus the fate) of the republic to the labor, the virtue, and the welfare of its workingmen, and they mounted a moral critique of free-labor capitalism that located the root cause of degraded labor and social inequality in a pervasive and selfish "spirit of avarice." That rapacious spirit, they believed, warped government and society, creating the conditions under which parasitical "nonproducers" (or "the aristocracy"), themselves possessed and morally deranged by avarice, unjustly deprived workingmen of the fruits of their labor. As a result, the discourse of the movement warned, workingmen were on the verge of enslavement through loss of their personal independence, and the republic itself was on the verge of that fatal corruption that (history and republican theory taught) was the inevitable consequence when love of liberty succumbed to love of gain. It was thus their urgent, momentous, and heroic duty to rescue, through organized collective action, labor and the republic from tyrannical wealth and the grotesque inequality it fostered.

Important as these themes were, there was significantly more to the movement's ideology than the "artisan [or labor] republicanism" stressed by a generation of labor historians. For one thing, as those historians themselves have noted, republicanism combined labor rhetoric with an emphasis on equal rights and the labor theory of value. Thus, workingmen proclaimed their right to organize for their own protection and sang countless paeans to the generative and civilizing powers of their useful (skilled) labor. Moreover, they juxtaposed such paeans with laments of labor's degradation, thereby highlighting and protesting what they saw as a jarring, telling, and dangerous contradiction between the dignity and respect labor deserved and the contempt and exploitation it suffered.

From the complementary currents of evangelical Protestantism, with its promise of salvation through free will and free-labor capitalism, with its promise of economic gain through individual exertion, came the theme of collective self-agency that saturated workingmen's ideology and lent it effectiveness in rallying workers to the cause. If workingmen awoke to their imminent slavery and united to resist those who would enslave them, this theme promised, victory—and with it the gratitude of "posterity"—would be theirs. Its logical counterpoint was that workingmen ultimately had only themselves to blame for their oppression. Indeed, the notion of workingmen's ironic and perverse complicity in their own degradation figured prominently in the movement's ideology, complementing and reinforcing republicanism's emphasis on vigilant citizenship.

The parallels with antebellum revivalist Protestantism's treatment of individual sin and salvation are revealing. Labor ideology in this period (and beyond) was, on the whole, saturated with evangelical language and themes, a fact too often obscured by the almost single-minded stress placed by most labor historians on artisan republicanism. Scripture, for example, provided rich material for pointed condemnations of unjust (that is, ungodly) accumulations of wealth, especially on the backs of those who labored. As prominent labor leader Seth Luther declared, quoting Jesus, in his *Address on the Origins and Progress of Avarice* (1834): "YE CANNOT SERVE GOD AND MAMMON." (It is worth noting here that "avarice" was at once a republican and religious trope, and like similar multivalent keywords in labor discourse it at once facilitated and reflected labor activists' blending of the two traditions.) Protestant millennialism not only supplied assurances that, as already noted, workingmen aroused and united in defense of their rights would prevail, but simultaneously elevated their cause to the plane of cosmic Christian conflict between light and darkness. On their cause, on their redemptive mission, rested the fate not simply of workingmen but of humanity itself.

Religion, then, lent labor protest legitimacy, hope, momentousness, and a clarifying moral critique that blasted the exploitation of labor and social inequality. Simultaneously, like republicanism's fear of class privilege and in conjunction with it, Christianity's emphasis on forgiveness muddied class ways of thinking and blunted the movement's radical edge.

Antebellum labor ideology was also highly racialized and gendered in tightly intertwined ways. In a republic where the vast majority of freemen were white men, whiteness was virtually synonymous with republican independence and citizenship, and blackness with dependence and servility (both exter-

nal and internal). Such a context ensured that jeremiads about workingmen's (imminent) descent into "white slavery" (a term far more common than "wage slavery") bespoke racialized anxieties about the security of workingmen's whiteness. Blacks loomed as the Other whose fate workingmen feared, abhorred, and seemed in danger of sharing. In such a context, as historian David Roediger (drawing on W.E.B. Du Bois) has argued in *The Wages of Whiteness* (1999), workingmen sought refuge in their whiteness, and whiteness (or more precisely, its privileges) in turn provided them with a psychological "wage" that could compensate for their economic exploitation.

The racialized anxieties workingmen's rhetoric bespoke were intimately bound up with dread of emasculation. The attributes of a slave—most notably, dependence and physical and mental servility—were precisely those of an unmanly man. Hence, antebellum labor ideology represented the labor movement as at once the expression and redemption of (white) worker manhood. Manly workingmen, it instructed time and again, were organized and united in defense of their rights; responsive to the heroic duty to which they were called as deliverers of labor, the republic, humanity, and posterity from the thralldom of oppressive wealth; and ultimately invincible. Manliness was also invoked, explicitly and implicitly, to contrast fair (i.e., manly) workingmen with their unjust (i.e., unmanly) oppressors.

In manliness, in short, race, class, and gender converged. As a trope, moreover, it served to condense and make even more compelling the major discursive elements of the labor ideology it pervaded. At the same time, in its accent on character and respectability, shared with and strengthened by the discourse of whiteness, manliness rhetoric muted even as it amplified the movement's class timbre.

The manliness trope occasionally inflected even the rhetoric of protesting women workers and their female allies in interesting ways. In 1844, New England activist Sarah Bagley combined feminist overtones with deference to workingmen's manly agency when, on one hand, she firmly protested the economic and political circumstances of New England's female factory operatives, while on the other she looked to workingmen "to protect your daughters and sisters."

In contrast, a contemporary of Bagley mocked men's pretensions to manliness ("Prate no more of your manliness") and asserted that not men but "the strong and resolute of their own sex" would protect women. Other female labor leaders conceived of mobilized and united workingwomen in ways that paralleled the concept of manliness among their male counterparts.

Nor were the twinned tropes of slavery and whiteness confined to male workers' rhetoric. Urging the women shoebinders of Lynn, Massachusetts, to strike for a higher wage in 1860, Clara Brown was quoted in the *New York Times* in language that brought a sharp rebuke followed by a revealing clarification on her part: "Don't let them make niggers of you; (Shame, there are colored persons here.) I meant Southern niggers."

The ideology of the antebellum labor movement was thus multidimensional and complex. It was also elastic. For these reasons it lent itself to no single, specific program, but rather to a variety of movement objectives, some more pronounced in one phase than in another, all of them intended to redress labor's degradation and the social inequality it so glaringly reflected. For the same reasons, it lent itself equally well to excoriations of "nonproducers" and "purse-proud aristocrats," "grinding employers," and "capital" (a term invoked with increasing regularity in the period's second half).

Among the principal demands that defined the movement as it first emerged in its early years were public funding of public schools; restrictions on (or even the abolition of) state-chartered corporations (paper-money-issuing banks were judged to be particularly dangerous); abolition of imprisonment for debt; restrictions on convict labor; mechanics' lien laws to ensure payment for work done; reform of militia service so as not to burden workingmen financially; and the dispersal of public land in the West to small homesteaders rather than speculators (an aim that, with varying intensity, persisted throughout the period). As this list suggests, privileges and monopolies obtained through "class" legislation favoring "the few" at the expense of "the many" were perceived as the primary problem.

This early antimonopoly stance and related concern with government-sponsored "artificial" privileges would to varying degrees remain a general feature of the movement. At the same time, from the early-1830s on, labor activists as a whole repeatedly focused on developing trade unionism at the craft, city, and national levels; staging strikes over wages and hours; securing the ten-hour day; and, as an alternative to the wage system, establishing worker-owned cooperative workshops (in addition to land reform).

The ideology (and related objectives) of antebel-

lum labor protest at once cast doubt on, critiqued, and suggested alternatives to the period's dominant free-labor ideology. Free laborism stressed the imperative and possibility of virtually unlimited (white male) self-making in a world where wagework was (supposedly) but a temporary condition, a waystation on the road to becoming one's own boss, who in turn hired other men on their way up. It took as givens and represented as natural the values and workings of the marketplace, above all competitive individualism and the law of supply and demand.

Organized workingmen did not reject upward mobility; indeed, their rhetoric occasionally pointed with pride to mechanics who, through their own skill (or genius) and hard work, had risen out of the ranks of labor. But neither did they embrace the unbridled, exploitative, selfish race for wealth they perceived all around them and to which they attributed their own, and the republic's, alarming situation. Their ideology represented the scramble for gain as immoral and corrupting of republican simplicity and virtue, as rewarding only a few, and as exposing the hypocrisy in free-labor rhetoric about the dignity of labor ("If labor of the hands is thus honored and rewarded," a leading labor paper of the 1840s pointedly asked, "why such a universal scramble . . . to forego its honors and rewards, by entering into speculation and trade?"). And it rejected the arguments of free-labor proponents that the price of workmen's labor—their property, some labor advocates called it—should be determined by supply and demand, and that unions were both unjust and unnecessary. Labor ideology was not revolutionary—it did not envision the violent overthrow of one class by another; but, as the foregoing suggests, it was radically oppositional in its challenge to the basic thrust and dominance of free-labor values.

Phases and Leadership

The early years of the movement were dominated not by trade unionism but by labor politics in the form of Working Men's parties, the most important of which were centered in the metropolitan Northeast. Philadelphia led the way when the MUTA resolved in early 1829 to organize a party in that city. New York and Boston soon followed suit. Party platforms shared a thoroughgoing antimonopolism focused on the evils of legislatively created corporations in the financial and manufacturing sectors. Despite the impressive showing of some at the polls—Philadelphia Working Men, for example, won more than 30 percent of the vote in 1829, while that same year the New York party elected a journeyman carpenter to the state assembly (and came close to sending six others to Albany with him). The parties proved short-lived. Inexperience, factionalism, and the lure of Andrew Jackson's Democratic Party, which attracted workingmen's votes with its antimonopoly agenda and its celebration of producers over nonproducers, all took their toll.

Wary of labor politics, workingmen's advocates in the early 1830s concentrated instead on trade unionism. A flurry of union building and strikes ensued, fueled in no small part by the ten-hour day demand. (That demand, it should be noted, entailed political pressure brought to bear at the state and federal levels, and thus the labor movement never eschewed politics altogether in this period of surging unionism and beyond.) Led by the General Trades' Union (GTU) of New York (1833), citywide federations of local unions soon emerged in more than a dozen cities in the East and trans-Allegheny West. The GTUs not only lent financial support to strikes by member unions but also sponsored lectures and labor newspapers. Their conventions and committees, moreover, schooled journeymen in participatory union democracy. Trade union membership probably hovered between one-fifth and one-third of urban journeymen, a proportion never again attained before the Civil War.

Beyond the citywide federations, two innovative organizations of this period were the New England Association of Farmers, Mechanics, and Other Working Men (1832) and the National Trades' Union (1834). The association dedicated itself to the ten-hour day and set March 20, 1832, as the date on which, absent overtime pay, all members of the organization "except practical farmers" were "to labor no more than ten hours for one day." As its title suggests, it was the first attempt at industrial unionism in the United States, seeking to unite in a single organization factory operatives, unskilled laborers, and skilled tradesmen. The Trades' Union, whose founding convention attracted delegates representing more than 25,000 workers in six Eastern city centrals, marked the first national organization of American workers, though during its two-year existence it remained geographically narrower than its name promised.

The upsurge in unionism was accompanied by a veritable wave of strikes, with some of the most important action occurring in Boston, Philadelphia, and New York. In 1835, Boston carpenters, masons, and stonecutters, joined eventually by the city's housewrights, struck for the ten-hour day. Though ultimately unsuccessful, the strike produced a stirring and influential document in the antebellum struggle

for shorter hours, the "Ten-Hour Circular." Depicting the struggle as one between workingmen and "Capital," the circular declared in language redolent with republicanism, evangelical Protestantism, whiteness, and manliness: "We cannot, we will not, longer be mere slaves to inhuman, insatiable and unpitying avarice." Sentiments like these helped that same year to inspire a general strike in Philadelphia (the nation's first) for the ten-hour day. The strike was notable for including skilled and unskilled, Irish and native-born workers. Aided by a petition campaign, it succeeded in pressuring the city council to limit the hours of workingmen employed by the city to ten. Other employers quickly followed the council's example.

In New York the next year, striking journeymen tailors became the object of an employer offensive against unions and strikes that left twenty tailors convicted of conspiracy. Both the conviction and the presiding judge became instantly notorious among the workingmen of New York and beyond. Some 27,000 of the city's residents rallied in protest, burning Judge Ogden Edwards in effigy and blasting the prosecution of the tailors as "a concerted plan of the aristocracy to take from them that Liberty which was bequeathed to them as a sacred inheritance by their revolutionary sires." In Philadelphia, protests led to an unprecedented formal alliance between skilled and unskilled workers when the Trades' Union voted to include dockworkers.

Some women workers were also caught up in the strike wave of the 1830s. The New York Tailoresses' Society, organized in 1831 and 1,600 strong, struck that same year. In mid-decade Philadelphia, women shoe and clothing workers struck with the support of unionized male shoemakers and tailors. Among female textile operatives, the most notable strikes occurred in Lowell, Massachusetts, where mill owners' vaunted paternalism was both challenged and exposed as selfish when women stopped working in 1834 to resist wage cuts (unsuccessfully) and again in 1836 to oppose higher boardinghouse rents (resulting in compromise).

It was against this backdrop of surging and, for unions, resource-draining strike activity that the labor movement after mid-1836 began to embrace cooperative production as the "more permanent" answer to workingmen's oppression called for by the National Trades' Union. Cooperation, that organization maintained, would enable workingmen to sell "their labor directly to the consumer," thereby ending speculation and ensuring "they would receive the full product." As historian Bruce Laurie more pointedly summed up this program in *Artisans into Workers* (1989), it was "a collective project to achieve social equality and worker control." Though many cooperative workshops were indeed soon established, they, like the labor movement itself, succumbed to economic depression in 1837.

In its first decade, the movement was led by an array of talented activists, some of whom would continue as leaders when the movement revived in the 1840s. William Heighton, a cordwainer born in England, founded Philadelphia's MUTA; edited the Union's newspaper, the *Mechanics' Free Press;* and authored three speeches, the first of which ("An Address to the Members of Trade Societies, and to the Working Classes Generally. [1827]) profoundly influenced the rising of workingmen in his city and perhaps beyond.

The career of another Philadelphia cordwainer, William English, illustrates how thoroughly involved activists could be in the full range of existing labor institutions. English served as a leader of the Philadelphia Working Men's party, as a founding delegate to the National Trades' Union, and as president of the Philadelphia Trades' Union. He orated in favor of the ten-hour day and helped to found the National Association of Cordwainers before being elected state representative in 1836.

Among the New York leadership, machinist Thomas Skidmore created a considerable stir with his *The Rights of Men to Property!* (1829), a proposal for eliminating social inequality through an agrarian program of redistribution and expropriation. His approach was too extreme even for the Working Men's party to which he belonged before being expelled. Breaking with Skidmore, labor editor George Henry Evans developed a moderate land reform proposal that would figure prominently in the labor movement in the 1840s. Other leaders benefited the city's GTU, especially printer Ely Moore, its first president, and chairmaker John Commerford, who succeeded Moore in 1835. Moore had been elected the previous year to the chairmanship of the National Trades' Union and to the U.S. House of Representatives. New York also produced Sarah Monroe, leader of the Tailoresses' Society, about whom little is known.

In Boston and New England, the carpenter Seth Luther emerged as probably the region's most influential and best known labor activist. A brilliant orator and agitator, several of whose addresses were published as pamphlets, Luther helped to organize the Boston Trades' Union and also championed factory hands. He was likely principal author of the "Ten-Hour Circular" and was still agitating the cause

eleven years later in 1846, the year he died. No antebellum labor leader produced more scorching jeremiads on the evils of avarice and factory work.

Luther's agitation in the 1840s was part of the labor movement's post-Depression revival around especially the ten-hour day demand. The struggle galvanized New England journeymen and female mill workers who cooperated across lines of skill and gender. Women played a critical role by engaging in petition campaigns to pressure state legislatures to enact ten-hour statutes. Male–female cooperation was institutionalized when the New England Workingmen's Association (1844) agreed in 1845 to admit the Lowell Female Labor Reform Association (1844). Both groups led the way organizationally.

Sarah Bagley rose to prominence as leader of the Lowell Female Labor Reform Association. A Lowell operative herself, Bagley spearheaded a petition drive aimed at the Massachusetts legislature, organized factory women in New Hampshire, and published critiques of factory conditions and owners. She collaborated with harness maker William F. Young, editor of the influential *Voice of Industry*, organ of the Workingmen's Association, and a key figure himself in the decade's labor agitation. For a brief period, Bagley edited the *Voice* after her association acquired it.

The ten-hour struggle of the 1840s had mixed results. New Hampshire passed the nation's first state ten-hour law in 1847 ("ALL HAIL NEW HAMPSHIRE," exulted the *Voice*), and Pennsylvania followed suit a year later after strikes and political pressure dating from 1845. Both laws, however, had loopholes. The Massachusetts legislature, notwithstanding the testimony of Sarah Bagley and six other women before a House committee, and a subsequent intensified petition campaign, refused to act.

Even as the ten-hour contest unfolded, workers and their leaders sought alternatives to the wage-labor system in cooperative workshops and land reform. From shoemakers in Lynn to German tailoresses in Cleveland, they established cooperatives throughout the North and West. Under the leadership of George Henry Evans, the National Reform Association (1844) promoted land reform as the solution to workers' ills. With its slogan "Vote Yourself a Farm," the organization sought to make public lands available for free to homesteading families. Both cooperationists and land reformers were represented in the Industrial Congresses that nourished labor activism across the urban North from the mid-1840s to the mid-1850s.

The 1850s witnessed a major development in the

THE FACTORY BELL
By an Unknown Factory Girl 1844

Most nineteenth-century Americans did not own a clock or a watch of their own to keep time. The tolling of the factory bell signified the beginning and end of the harsh workday for young women employed in the New England textile mills.

Loud the morning bell is ringing,
Up, up sleepers, haste away;
Yonder sits the redbreast singing,
but to list we must not stay.

Not for us is morning breaking,
Though we with Aurora rise;
Nor for us is Nature waking,
All her smiles through earth and skies.

Sisters, haste, the bell is tolling,
Soon will close the dreadful gate;
Then, alas! we must go strolling,
Through the counting-room, too late.

Now the sun is upward climbing,
And the breakfast hour has come;
Ding, dong, ding, the bell is chiming,
Hasten, sisters, hasten home.

Quickly now we take our ration,
For the bell will babble soon;
Each must hurry to her station,
There to toil till weary noon.

Mid-day sun in heaven is shining,
Merrily now the clear bell rings,
And the grateful hour of dining,
To us weary sisters brings.

Now we give a welcome greeting,
To these viands cooked so well;
Horrors! Oh! not half done eating—
Rattle, rattle goes the bell!

Sol behind the hills descended,
Upward throws his ruby light;
Ding dong ding,—our toil is ended,
Joyous bell, good night, good night.

history of organized labor in the United States with the rise of national unions in various trades (among them the hatfinishers, cigar makers, typesetters, shoemakers, machinists and blacksmiths, and iron molders). Some were short-lived; all were important as a next stage in labor's organization-building. With the national unions came new leaders like molder William Sylvis, principal founder of the Iron Molders' International Union (1859), who grasped the need for strong national organizations in the context of nationwide markets and employers' associations. Sylvis himself would emerge as the nation's single most important Civil War–era labor leader.

The decade also saw continued agitation for the ten-hour day and episodes of intense strike activity culminating in what was then the largest strike in U.S. history, the Lynn shoemakers' strike of 1860. More than 20,000 men and women participated, bolstered by their numbers and placards like the one proclaiming, "American ladies will not be slaves: Give us a fair compensation and we labor cheerfully." Leadership came from men like Alonzo B. Draper, editor of the *New England Mechanic*, president of the Lynn Mechanics' Association, and an advocate of women's participation in support of higher wages for journeymen, and from women like Clara Brown, a young factory stitcher who sought to raise women's wages along with men's. After two months the strike ended in defeat. Its size, its mass mobilization of factory workers, and the presence of the militia were all harbingers of labor–capital conflict in the future.

Assessment

The antebellum labor movement, like all social movements, was characterized by strengths and weaknesses, some more easily seen with the advantages of hindsight and historical study. Certainly, the movement succeeded in bequeathing to American workers in the Gilded Age and beyond a core set of institutions—trade unions, city centrals, and at least fledgling nationals—as well as attendant institutional practices that would empower and sustain them in their conflicts with capital and would form the basis of the modern American labor movement. It succeeded, too, in developing and passing on the weapon of the strike, along with a program for radical change—cooperative production—that promised to make both strikes and wage labor obsolete. It ameliorated the exploitation of some, though by no means all, workers, prepared the way for the eight-hour day struggles, and engendered working-class pride and self-respect. More generally, the movement established organized labor protest as a permanent, if contested, part of the American political and social landscape.

And yet the divisive lines of ethnicity, race, gender, and skill seriously hobbled the movement. Nativism, together with the massive influx of German and especially Irish immigrants in the decade 1845–1854, created a fragmented working class, though there were hopeful instances of solidarity across ethnic lines. The movement also excluded blacks and marginalized white women. Even when male unionists supported, or sought the support of, women workers, they did so typically out of a sense of chivalry or a desire to lend legitimacy to their own cause.

The very language of labor, with its densely intertwined tropes of whiteness and manliness, iterated and reiterated racial and gender lines. And since lack of skill was readily associated with blacks, women, and Irish immigrants—who in turn were easily associated with dependence and lack of self-control—skilled workingmen most often shunned the unskilled. A different kind of line, between North and South, also limited the movement as Southern white male artisans actively cast their lot not with one another but with the slaveholding elite.

The movement's language and ideology were also problematic. There was a melodramatic and romantic cast to both that tended toward oversimplification—for example, the notion that aroused and united workingmen were invincible, which ultimately left only workingmen themselves to blame for their oppression. And for all that republicanism, evangelical Protestantism, whiteness, and manliness fed the movement's class-inflected oppositional critique of free-labor capitalism, they simultaneously muted classist ways of thinking and blunted labor radicalism.

Nonetheless, the antebellum labor movement stands as a significant and inspiring, if flawed, movement for social justice that first confronted more than 175 years ago issues of economic fairness that are with us still.

Labor Movement 1861–1877

The years 1860 to 1877 were a pivotal era in the history of American labor. The Civil War was the catalyst that transformed both the economy and society, hastening the pace of industrialization and concentration of wealth in America. Monopolies and trusts were consolidating control of the nation's most important industries, making it more difficult for smaller firms to compete. Two interrelated trends posed a serious threat to workers' welfare: declining wages and the loss of jobs due to mechanization of the work process. The war brought prosperity to many businessmen and financiers, but most workers saw prices increase and their earning power decline. Male workers' earnings dropped, but women earned less than half of what men did, and children could be exploited for even less. Employers regularly pitted each against the other to keep wages down. Despite full employment conditions during the Civil War, the effects of labor-eliminating mechanization and unskilled workers had caused real wages in 1865 to drop by one-third from their 1860 level. Mechanization of many industries also meant that work could be simplified to the point where employers did not have to pay a premium for skilled workers.

This upheaval in the workplace challenged labor, which was primarily organized on local levels, or along craft lines, to organize unskilled and semiskilled workers along industry lines on a national scale. The question for organized labor was whether it would remain as a narrow-based pressure group of craft workers, or transform itself into a broad-based working-class social movement open to all workers. The Civil War, which gave America, as President Abraham Lincoln put it, "a new birth of freedom," unleashed social forces of egalitarian reform in the labor movement. As a result, unions had to grapple with how they would respond to questions of race, gender, and immigration.

The Iron Workers

During the mid-nineteenth century, the Iron Molders' International Union played an important leadership role in the effort to unite labor and mobilize it as a social movement. The Iron Molders was one of the most militant unions of the day, seeking social reforms through political action. Its president, William H. Sylvis, was one of the era's most dynamic labor leaders. Under his leadership, the Iron Molders established small-scale, worker-owned cooperatives, so that they could keep the fruits of their labor. But their cooperative efforts were overwhelmed by the growing industrial capitalist system. Workers cooperatives could not raise the capital necessary to update their relatively small factories with the latest equipment and technology, and therefore could not compete with the larger, corporate-owned factories. Sylvis also supported women's rights and labor solidarity, both domestic and international. Having witnessed firsthand how strikes had almost wiped out the strike fund, Sylvis was persuaded that strikes were not the best instrument for advancing labor's cause. Instead, he argued for political action and was instrumental in the formation of the National Labor Union and the National Labor and Reform Party, both of which strove to organize mutual aid associations and to challenge employers directly at the workplace.

The Eight-Hour Movement

Since there were no regulations governing the length of the working day, it was not uncommon during this period for workers to labor ten to eighteen hours a day, six days a week. The issue of shorter hours was a top priority for the labor movement, and the fight for the eight-hour day was the historical continuation of labor's pre–Civil War struggle for the ten-hour day. A machinist named Ira Steward, who worked twelve-hour days, became one of its chief proponents. As a

delegate to the International Union of Machinists and Blacksmiths' convention in 1863, he was instrumental in the passage of a resolution calling for the enactment of a law to guarantee workers the eight-hour day. The union donated $400 and put Steward in charge of organizing the movement. He was president of the Boston Eight Hour League and the National Ten Hour League. In 1864, he formed the Labor Reform Association to push the fight for the eight-hour day. The next year, he teamed up with the abolitionist Wendell Phillips to found the Grand Eight Hour League. With the end of slavery, Phillips and many other abolitionists turned their attention to the problems associated with wage slavery. However, this potentially powerful coalition broke up when union members wanted to bar the importation of Chinese workers from America.

Borrowing a political tactic from the land reform movement, the Grand Eight Hour League of Massachusetts lobbied politicians in 1865 to secure their pledge of support for the cause. This political strategy secured only twenty-three supporters in the Massachusetts legislature, but the depression of 1866 spurred worker interest in political reform, especially the eight-hour day. Steward argued that cutting working hours without cutting pay would not only give workers more leisure time, but it would also increase employment and workers' purchasing power. In *Toil and Trouble: A History of American Labor* (1971), Thomas R. Brooks cites a popular rhyme that summed up Steward's idea: "Whether you work by piece or by day; decreasing the hours increases the pay."

The momentum for the eight-hour movement increased as Connecticut, Illinois, Missouri, New York, and Wisconsin passed laws during the late 1860s. However, these state laws contained glaring loopholes; they permitted employers to require that their employees sign ten-hour contracts. The eight-hour provision applied only if employers failed to mandate longer hours, and Wisconsin's law applied only to women and children. These laws were short-lived since the desperate search for work during the depression years of the 1870s effectively nullified this modest advance. The movement had better success on the federal level when Congress passed an eight-hour law in 1868. However, it applied only to laborers and mechanics working for the federal government. The eight-hour day was a plank in the Republican Party's platform in 1872, but most workers would have to wait until 1886 for the labor movement to take up the issue again. Shorter working hours remains a goal of many in the labor movement today.

The National Labor Union

Rapid industrialization and technological developments such as the railroads and telegraph during the Civil War hastened the process of the nationalization of the economy that had begun prior to 1860. It became apparent to a handful of labor leaders that the traditional system of isolated local trades' assemblies was no longer sufficient to cope with the threat posed by large corporations and trusts whose reach spanned the nation, and beyond. Two unsuccessful attempts were made to form a national federation of unions in 1864. First, Robert Gilchrist, president of the Louisville Trades' Assembly, called for a national convention, but his call went unheeded. But a second call in September resulted in a meeting of twelve delegates from eight local trades' assemblies under the rubric of the International Industrial Assembly of North America. The assembly never met again, but its constitution called for the establishment of a strike fund based on per capita union membership, a concept later used by unions such as the Knights of Labor and the Cigar Makers. Moreover, its organizational structure, which rested on local trades' assemblies, became the model for the National Labor Union.

Although the eight-hour movement did not achieve its goal, it did give birth to the first national federation of labor, the National Labor Union. The process began when the Grand Eight Hour League of Indiana called for state conventions across the land to elect worker representatives to attend a national convention. In March 1866, representatives of all but two national unions met in New York and called for a national convention to be held in Baltimore in August. The local orientation of most unions of the day is illustrated by the fact that local trade unionists in New York City quickly accused the national leaders of exceeding their authority by calling for the national convention. A compromise was reached allowing the Baltimore convention to be held on August 20 and the National Labor Union to be founded.

William Sylvis was a moving force in the formation and leadership of the National Labor Union and became its first president. The political center of gravity was the local trades assemblies as the distribution of delegates to the 1866 convention shows: seventy-seven delegates representing 60,000 workers answered the call, including fifty delegates from fifty local trade unions, seventeen delegates from thirteen trades' assemblies, seven delegates from five eight-hour leagues; and three delegates from two national unions. The National Labor Union was not a union

per se; rather, it was a loose federation of unions, and it also included political reformers from the suffrage, abolitionist, and other movements. It was too unwieldy to hold together for long, but it represented an important effort to bring unity and a semblance of national cohesion to the decentralized American labor movement.

The National Labor Union's leadership was dominated by political reformers and intellectuals, more so than labor leaders. Its political reform agenda was expressed through committees established to address a wide variety of concerns: the eight-hour day and other labor concerns, land reform, currency reform, women's rights, cooperation, inflation, the abolition of contract prison labor, and the establishment of a public works program. However, the National Labor Union's political reform goals were often in conflict with the racist outlook, and "pure and simple" unionism, of many of its local union members. The goals of political reform were beautifully expressed by one National Labor Union leader quoted in Brooks's *Toil and Trouble:* "What is wanted is for every union to help inculcate the grand ennobling idea that the interests of labor are one; that there should be no distinction of race or nationality; no classification of Jew or gentile; Christian or infidel; that there is one dividing line, that which separates mankind into two great classes, the class that labors and the class that lives by others' labor." Although the 1869 convention admitted Isaac Myers, president of the Colored National Labor Union, as a delegate, it sidestepped the issue of race, effectively killing any action to effect racial unity in labor's ranks. The importation of Chinese laborers was another issue that divided the National Labor Union. Many in the labor movement urged the repeal of the Burlingame Treaty (1868), which recognized the right of the peoples of the United States and China to emigrate to each other's country.

National leaders, some of whom were not workers, pursued broader political goals, but local trades' assemblies, which made up the National Labor Union's backbone, wanted concrete benefits for their members. Political conflict between its constituent parts was a major cause of the union's demise. Moreover, the lack of adequate revenue, due to poor recordkeeping and assessment of dues, meant that the National Labor Union had trouble funding its operations from the start. Sylvis died in 1869, and the National Labor Union began to decline in 1870. Political bickering between the political reform and pure and simple unionism factions led to the ultimate demise of the National Labor Union. The Industrial Congresses held between 1873 and 1875 represented a futile attempt to resurrect the mission of the National Labor Union without its focus on political reform. This was a seeming impossibility, and the congresses, like the National Labor Union before it, represented a national leadership body in search of a membership base.

The National Labor and Reform Party

Sylvis recognized that labor was in a weak position; even when workers won a strike, employers often regained their advantage through firing, blacklisting, wage cuts, increasing production requirements, and breaking unions. Instead, he argued for political action. The National Labor and Reform Party was the result of his vision that labor should have its own political voice. Like the National Labor Union, the National Labor and Reform Party reflected the ideas of political reformers and intellectuals more than those of labor leaders. On February 21, 1872, the National Labor Union held a political convention in Columbus, Ohio, and adopted its political reform goals as the National Labor and Reform Party's platform. Its platform called on the federal government to bypass the banks and directly issue a national currency ("Greenbacks"); establish the eight-hour day; provide public land for landless homesteaders, not corporations or real estate speculators; regulate the railroads and telegraph companies; enact civil service reform; and abolish prison contract labor.

The convention nominated Judge David Davis of Illinois to be its candidate for president, but he declined the offer and the party was left without a presidential candidate. Although this fiasco effectively killed the National Labor and Reform Party, it met again in Cleveland in September to nominate a second candidate, Charles O'Connor, a New York lawyer. O'Connor was the first Roman Catholic to run for president, but he received only 18,602 votes.

The Order of the Knights of St. Crispin

Named for the patron saint of their trade, the Order of the Knights of St. Crispin was founded in 1867 by Newell Daniels. Although it was founded in Milwaukee, the order's roots lie in Massachusetts. Daniels was a refugee of the Massachusetts shoemaker strike of 1860 where the order was well received. The order was formed in response to pay decreases brought on by the introduction of shoemaking machinery prior to

the Civil War that could be operated by unskilled workers. Shoemaking was once a proud craft that commanded decent wages, but even low-paid children could now make shoes. With increased competition in a labor market where sixteen-hour days were not uncommon, the prevailing wage was only $3 a week for men and as little as $1 for women. These adverse social conditions set the stage for the order's founding.

The Knights of St. Crispin were greeted by shoemakers who realized that collective action was needed to stem the loss of jobs and falling wages. Nationwide, its growth was so rapid and widespread that 600 local lodges were represented at the first Grand Lodge, the nationwide gathering of the order, in 1868. For the next five years, it was the most powerful labor union in the United States. At its peak, the Crispins had an estimated 50,000 members, and their reach was international. The Crispins sought legislation and collective bargaining agreements to protect their jobs from unskilled workers, "green hands" as they called them. The order's political influence was such that the politicians sought its endorsement. They established producer's cooperative stores to help insulate workers from the vicissitudes of the labor market. They also favored the idea of consumer cooperatives that were pioneered in England by the Rochdale plan (one of the earliest worker cooperatives) in the 1840s. But, as with other worker cooperatives, they could not compete with larger, better-financed corporate enterprises.

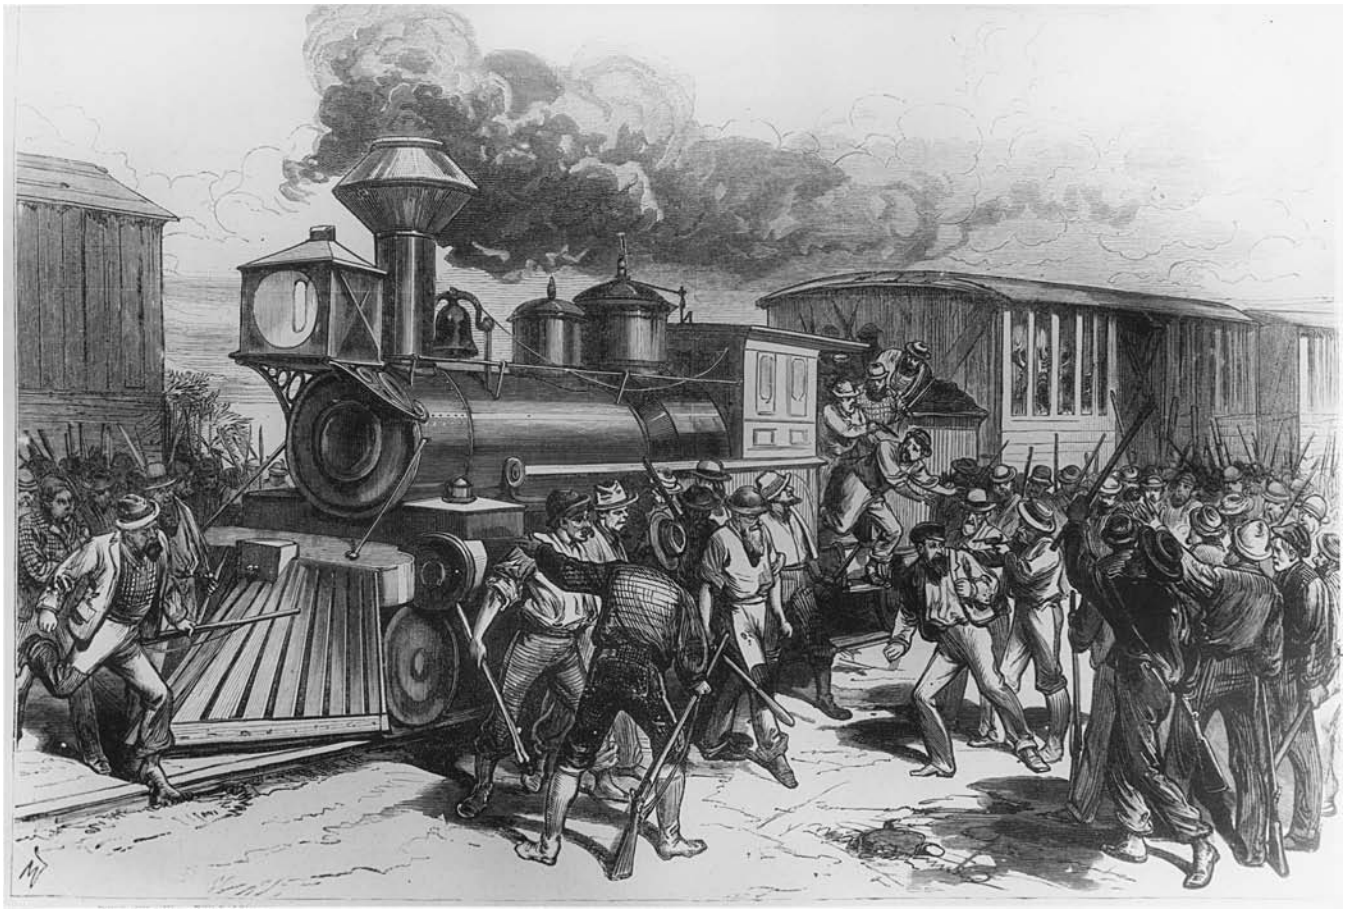
During 1868–1869, the Knights of St. Crispin successfully conducted many strikes, which took employers by surprise. It also successfully fought against pay cuts for its members. Female shoemakers also united, forming the Daughters of St. Crispin in 1870 to maintain wages and improve working conditions. Although many male-dominated unions of the era discriminated against female members in their trade, the Knights were supportive of the Daughters. The Daughters of St. Crispin, in turn, worked closely with their male brethren, gaining the Knights support in several strikes. When female shoemakers were fired in Baltimore for their union membership, the local Knights conducted a sympathy strike to show support for their sisters' right to belong to a union.

Employers countered the Knights of St. Crispin's success by organizing into trade associations, blacklisting union agitators, and hiring strikebreakers. In 1870, a North Adams, Massachusetts, employer could not find any local strikebreakers to hire. He transported seventy-five Chinese workers from San Francisco by transcontinental railroad, paid them less than half the wages earned by the order, and broke the strike. In Philip Foner's *History of the Labor Movement in the United States: From Colonial Times to the Founding of the American Federation of Labor* (1947), the employer is quoted as declaring that he would continue to break strikes in order "to free himself from the cramping tyranny of the worst of American trades-unions—the Knights of St. Crispin"—illustrating the extent to which employers feared the collective power of the Crispins. However, the Crispins could not compete with this tactic and so turned their ire against the Chinese strikebreakers as much, if not more than, the employers. From 1872 onward, employers were consistently able to break strikes. The Knights of St. Crispin failed to adapt to the changing times by not reaching out to organize the unorganized, such as the Chinese immigrants. By 1875, the Crispins had all but dissolved as a labor union. Labor circles at the time widely believed that strikes were a weak tool, so the Crispins eschewed strikes in favor of arbitration, that is, collective bargaining and negotiation, with employers. However, it was too late for the Crispins to change strategy, and they completely disappeared by 1878.

Although the Knights of St. Crispin disbanded in 1878, so many of its leaders and members joined the more successful Knights of Labor that they became its backbone. As a result, the Knights of Labor adopted many of the innovations pioneered by the Knights of St. Crispin.

The Cigar Makers International Union

Originally founded on June 21, 1864, as the National Cigar Makers Union, it changed its name to the Cigar Makers Union International in 1867. The union was a skilled trade union whose membership was predominantly made up of male cigar rollers. Female cigar rollers tried to join the union in 1864 but were rejected by their male counterparts, who did not see a compelling need to admit women. Men were suspicious that women, who were paid less by employers, were competing for their jobs. Subsequently, the women formed their own union and built it to the point that the men accepted them for membership three years later. But in 1872, the men took the self-defeating step of excluding women from membership when skilled female Bohemian cigar makers entered the market. Employers were quick to hire the women as strikebreakers. Adolph Strasser ruled the union with an



When railroad workers walked out in Martinsburg, West Virginia, then blocked a train from passing through town until the company rescinded a wage cut, President Rutherford B. Hayes sent in federal troops to disperse them. This action ignited the first nationwide strike in July 1877. *(Brown Brothers)*

iron hand, establishing top-down control over the locals. A young cigar roller named Samuel Gompers came to prominence in the Cigar Makers Union as a result of his political skill at reorganizing and stabilizing the New York local during this time period. The union, like others during this time period, faced increasing threats to their jobs posed by the introduction of labor-eliminating machinery.

The Panic of 1873

In 1873, the overproduction of industrial and agricultural goods, combined with a decline in demand, created conditions of economic instability. Excessive stock speculation on railroad construction projects further weakened the economy to the point where, on September 18, the prominent banking firm Jay Cooke and Company collapsed. The resulting bank panic sparked a stock market crash that resulted in more than 5,000 business failures by year's end, a sharp drop in national income, and widespread unemployment, especially for working-class Americans.

The panic of 1873 had a devastating effect on organized labor, especially the national unions that had gained a foothold during the 1860s and early 1870s. In 1873, there were thirty national unions in existence, but only eight were left by 1877. From the end of the Civil War to 1873, organized workers' wages rose due largely to their success at building national unions, winning strikes, and engaging in collective bargaining. But the panic of 1873 triggered a long depression that lasted until 1878 and caused a serious decline in union membership, employment, and wage rates. Employers had the upper hand, and tactics such as blacklists, lockouts, "yellow dog" contracts (signed between employers and union leaders, without the participation of workers), and lawsuits were effective tools for disciplining a workforce that was living in desperate circumstances.

The National Strike of 1877

By 1877, workers had suffered through four years of depression, unemployment, and wage cuts. When the Baltimore and Ohio Railroad cut wages by 10 percent on July 16, the second pay cut in eight months, railroad workers went out on a wildcat strike. The strike rapidly spread to other railroads across the nation. Enraged workers demonstrated and rioted in protest in Baltimore, Chicago, Pittsburgh, and St. Louis, as well as in many smaller cities and towns across the nation. Militia had to be called in from as far away as Philadelphia to restore order after the Pittsburgh militia failed to restore order; in some cases, they refused to shoot civilians, but they failed to subdue the strikers who destroyed railroad tracks and burned down machine shops and the Union Depot. Workers in other industries also went on strike, transforming a railroad strike into a general strike that spread to all regions of the country. For a few days the workers were in control of, and operated, railroads, bakeries, and other businesses.

President Rutherford B. Hayes called out federal troops to quell the uprisings at Martinsburg, West Virginia, and Pittsburgh to subdue the striking workers and their sympathizers. Nine people were killed in Martinsburg, eighteen in Chicago, and twenty-six died in Pittsburgh. Hayes's use of federal troops broke the strike. Property damage was estimated in the range of $5 to $10 million. Perhaps the closest the United States has come to a sustained nationwide general strike, the National Strike of 1877 was a great social upheaval that sent shock waves through the upper echelons of society. Frightened state legislators around the nation responded by passing repressive conspiracy laws aimed at hamstringing organized labor and authorizing funds to build massive National Guard armories to house troops and munitions to guard against future worker uprisings.

Conclusion

America's break with its prewar past was so dramatic that historian Charles Beard labeled the Civil War the Second American Revolution. But revolutions are usually followed by periods of reaction and retrenchment by elites and conservative social forces, and this period was no exception. Labor's story during this era was one of trying, and failing, to form national unions to counter the growing power of capital. Labor's failure to meet this challenge was largely due to the fact that power in most unions of the time was lodged in the locals. Efforts to establish a national labor federation, such as the National Labor Union, foundered because of its top-down organizational structure. The National Labor Union's leaders had few followers, and its power base was in the local trades' assemblies. The Knights of St. Crispin was more successful in this regard largely because its national organization grew out of its grassroots base. This period was also noteworthy for the clash between labor's political reformist and its pure and simple unionism wings. Conflict arose on issues dealing with race, gender, and immigration between those in the National Labor Union who wanted to go into the political arena to reform society along more egalitarian lines and those, such as the Knights of St. Crispin and the Cigar Makers, who preferred to accept the status quo and concentrate on gaining immediate material benefits for their members. There was also conflict between the former group, which wanted to organize all workers, and the latter, which wanted to limit the focus to craft workers. Ultimately, these issues overwhelmed attempts to unite the two factions and build a national federation of labor of skilled and less skilled labor. Progress on these fronts would come in slow, incremental steps with future generations of workers, but the seeds of reform were planted during this era.

Knights of Labor

It is instructive to begin a discussion of the Knights of Labor as a social movement with two observations and two metaphors. First, the Knights of Labor was the largest labor organization in the United States in the nineteenth century. During its heyday in the 1885–1887 period, when it grew almost sixfold, it dwarfed its rival, the American Federation of Labor. The second observation is that the amazing growth of the Knights appeared to thoughtful onlookers to be a knitting together of America's highly diverse workers into a modern class, willing and able to act on its own interests. Karl Marx's associate, Friedrich Engels, opined in *The Labor Movement in America* (1887) that the Knights "are the first national organization created by the American working class as a whole."

But we must beware of imputing too much motive power to the organization known as the Knights of Labor. For the most part, the Knights did not organize and direct the social movement of workers in the mid-1880s as much as it served as a vehicle for that movement. In this regard two metaphors for the Knights are relevant: that of an umbrella and that of a parade. The Knights by its organizational openness, its grand ambitions, and its devotion to humanitarian reform was able to link together a wide variety of reformers—Single Taxers (followers of Henry George), Irish Land Leaguers, Greenbackers, Anarchists, Socialists—and diverse ethnic groups—Germans, Irish, Scandinavians, African Americans, and Central Europeans—workers of all skill levels, and women as well as men. Put together in almost a decade of growth, this heterogeneous mixture never quite congealed and ultimately proved quite combustible.

The second metaphor, that of a parade, should be understood in nineteenth-century terms. Political candidates and agitators often used parades led by impressive brass bands on the platforms of wagons to "drum up" support for speeches and rallies. The idea was to create a stir so that bystanders joined from the enthusiasm of the moment or "the bandwagon effect." The parade went on, but its membership was usually different from moment to moment. Such, in many respects, was the Knights of Labor, an organization characterized by enormous membership turnover at the local level and a succession of groups at its leadership helm. With only tenuous membership loyalty, the Knights' prospects were precariously dependent on the successes and failures of the strikes (there was little compromise bargaining in this era) into which it entered and the resulting fluctuations in public opinion (the bandwagon effect). That very dependence makes a strong argument for considering the Knights as a social movement rather than merely a labor organization.

Formation of an Industrial Working Class

One of the most important and influential insights of social movement theory into the process of movement formation is that the existence of deep-seated and valid grievances is not sufficient of itself to mobilize a social movement. In order to convert political opportunities into a social movement, the aggrieved group must have access to organizational resources. Rather than being recruited into a movement one by one out of an amorphous mass, aggrieved individuals usually join social movements as part of preestablished networks, organizations, or communities that are coopted by emergent social movements. Such associational networks provide social movements with the necessary legitimacy and incentives to participate, communication networks, and leadership resources. Thus, grievances may exist for many years until the resources become available that allow potential participants to take advantage of new political opportunities.

Such was the case with America's new industrial

With more than 700,000 members at its peak, the Knights of Labor was the largest working-class organization of the nineteenth century. Knights established cooperative factories and—as this advertisement shows—urged consumers to purchase only union-made goods. *(Wisconsin Historical Society/WHi 5068)*

working class, which in the mid-century was composed largely of recent immigrants from Ireland and Germany, the bulk of them Catholics. By the 1870s, the core industrial region was expanding from New England and the Mid-Atlantic region into the Great Lakes states. Pittsburgh, Detroit, Cleveland, Buffalo, Chicago, and Milwaukee became fast-growing industrial centers. The population of these cities was approximately 30 percent immigrant, with the percentage rising to over 67 if children were included. The immigrant percentage was far higher—sometimes double—in industrial employment. Perhaps as many as half of these new industrial workers were Catholics.

Unskilled immigrant industrial workers labored upwards of sixty-hour work weeks at poverty wages. Employment was highly uncertain, with busy periods alternating with slack ones and factory shutdowns. Families lived in overcrowded tenements or dilapidated shacks without paved streets or indoor plumbing; hence, in the summer typhoid and other epidemic diseases were common. In the winter, these urban districts were covered with a thick dust from the coal used to heat their homes.

Yet, with the exception of the skilled craftsmen among them, immigrant industrial workers rarely formed or joined protest movements until the 1880s. In large part, this was because they were marginalized by the nation's dominant reform discourse, which was Evangelical Protestant. Though it had figured heavily in the struggle against slavery, Protestant discourse had little to say about the wrongs done to immigrant workers. Indeed, the 1850s antislavery reformers were often tinged with anti-Catholic Know-Nothingism. In the two decades after the Civil War, the native reform tradition began to adapt to new industrial realities. The Knights of Labor would lead in that transition.

At first, the Knights were squarely within the dominant reform tradition. Uriah Stephens, the founder in 1869 of the Knights of Labor, was trained to be a Baptist minister and had been a proponent of John Fremont, the radical antislavery alternative in 1864 to Abraham Lincoln. When Stephens spoke, as he often did, about the need for "solidarity" of skilled with unskilled workers, this had as much to do with the Protestant reform tradition of benevolence and Christian brotherhood as it did with class consciousness. Likewise, his opposition to wage slavery drew as much from an abhorrence of the sin of idolatry of wealth as it did from the secular movements of labor and socialism. In addition to this element of Protestant reform, Stephens emphasized—as did other Prot-

estant trade union leaders of this era—character formation and personal uplift, manifested in a commitment to temperance and abstinence and opposition to saloons.

Stephens had also been a Mason, and he made the Knights a secret, oath-bound organization. During the initiation ceremony, which seemed to take up most of the local meetings, members in disguises read the elaborate initiation ritual, while new members wore blindfolds. Meeting times and places, even the very name Knights of Labor, were kept from the public.

At first, the secrecy, ritual, and reform language of the Knights were well suited to its existence as a small craft organization of garment cutters in Philadelphia. Secrecy served as a protective coloration to conceal it from its enemies among the employer class. And the crusading rhetoric of Christian brotherhood gave to its organizing a transcendent mission. But by 1876 a few organizers had begun to admit "sojourners"—new members not of the same craft—from the coal mines and unskilled trades in the Pittsburgh area.

The contradiction grew even greater after the Great Upheaval of 1877, a railroad strike against intolerable wage cuts that mushroomed into a pitched battle between industrial workers in the new Western (now Midwestern) industrial region of the country and the forces of order, including the U.S. Army. For the tens of thousands of workers who had participated in the collective actions of 1877, the Knights' grand idea of the organizational solidarity of all toilers promised to harness the newly displayed power of workers to bring the country's industry leaders to its knees. The number of district assemblies (which governed the local assemblies) jumped from three to fourteen immediately after the strike. Knights' assemblies also appeared in cities like Chicago and Detroit where the Knights offered a viable alternative to trade unions, which had been destroyed by the depression and unemployment.

Almost immediately, in the tradition of the older reform associations, these assemblies went into politics usually in conjunction with Greenback reformers. Yet, despite its growth, the extension of the order into the Great West, and its electoral success, the Knights was constrained in its develoment by its fundamental makeup. The secrecy and ritual antagonized the Catholic Church, which had historically been opposed to secret societies as dangerous competitors. The turn to politics in keeping with its reform tradition also had its drawbacks, for when the depression ended in 1879, the party movement collapsed and with it so did many Knights assemblies. Meanwhile, the revival of prosperity restored the fortunes of the trade unions, and labor activists left the temporary umbrella of the Knights. By 1879, with membership dwindling and dues income in freefall, the order was in crisis.

It was at this juncture that Terence Powderly, the Knights' Grand Master Workman who had succeeded Stephens in 1878, engineered a fundamental shift in the organization. An Irish Catholic machinist with roots in the trade unions and Catholic workers, Powderly understood the importance of mollifying church authorities. Under his leadership, the 1881 convention of the Knights abandoned secrecy and the oath. It also shifted the organizing and fund-raising efforts of the order from Philadelphia to Pittsburgh. The shift was almost revolutionary in its impact. The order shed its reputation that it excluded Catholics, and it opened itself to new and radical currents that were sweeping the Irish Catholic working class.

Virtually at the same moment that the Knights made their shift, Irish American working people began joining clubs by the thousands to support the Irish National Land League (INLL). The INLL was a "new departure" in Irish nationalist politics, uniting the movement for home rule in Ireland led by Charles Parnell, the revolutionary movement for Irish independence led by the Clan na Gael, and the agrarian movement of Irish peasants to regain title to the land. In America the INLL's drive to raise funds for the Irish movement was met with a great outpouring of enthusiasm and generosity among all segments of the Irish American community from the lace curtain Irish and the church to Democratic Party politicians and ordinary working people. Most significantly, the issue of land reform became an opening wedge for radicals like Patrick Ford, editor of the *Irish World and American Industrial Liberator,* to preach their doctrines of social reform to Irish Catholic workers. Ford's "Spread the Light" clubs enrolled hundreds of industrial workers, Knights of Labor activists, trade unionists of all backgrounds, and Socialists. The potentially explosive movement to override the prerogatives of property in (Irish) land became a broad movement transcending ethnic and religious backgrounds.

Just as important, members of the INLL popularized the Irish practice of shunning those who collaborated with the British enemy. The INLL's support for the "boycott," which originated in the struggle against a British land agent, Captain Boycott, was quickly exploited by trade unionists and Knights leaders for working-class purposes. In Chicago, for example, the Knights led two major boycotts during strikes in

1881–1882. During that period, Myles McPadden, an Irish nationalist Knights organizer, whom Powderly had dispatched to Chicago, brilliantly capitalized on the popularity of land reform and the boycott to organize dozens of new Knights of Labor local assemblies, most of them in industrial areas of Chicago. By the end of 1882, the Knights organization in Chicago and elsewhere had been transformed from a body of political reformers in mixed local assemblies devoted to Greenback politics to a labor organization of industrial workers, with a plurality of Irish Catholics. Fully 40 percent of the names of all delegates and officers of Chicago's two district assemblies were Irish. Nationally, the order began to grow rapidly in 1882, with a majority of new local assemblies being trade in character.

The reorientation of the Knights under Powderly's leadership and its use of the Land League and Irish nationalist movements to draw in Irish Catholic workers exemplified how social movements must coopt existing organizational, communication, and leadership networks to be successful. It also exemplified another critical element in social movement formation—"framing"—that is, the social process by which grievances are generalized and shaped into political claims that resonate with public opinion. Framing often involves a "dressing up" of collective actors in symbolic clothing. The new popularity of the boycott exemplified that symbolic process. Boycotting was not something new. The American revolutionary movement had used it in the 1760s–1770s, and trade unions had boycotted sporadically well before the 1880s. Clothing that tactic in the rhetoric of Irish nationalism served to ease the way of Irish workers into the labor movement and to spur the spread of boycotting in the movement at large. As McPadden put it, the power of the Knights lay not in strikes but in the ability to "boycott" scabs.

By the same token, framing could also involve a change in meaning of old symbols. Thus, what was once Christian brotherhood and universal humanitarianism—expressed in the Knights motto, "an injury to one is the concern of all"—became a synonym for a labor principle, amalgamation across craft lines, and a working-class identity. Only the Knights of Labor, an organization with one foot in the reform tradition and the other in the labor movement, could have effected this symbolic transformation.

Expansion and Turbulence

By 1882–1883, the Knights were poised to make another transition—to leadership of a broad national movement of industrial workers for the eight-hour day. Labor's Great Upheaval from approximately spring 1885 to fall 1887 illustrates an important development in social movement theory, the notion of "cycles of contention." Under the right circumstances, social movements can rapidly diffuse, wavelike, across the social system, overwhelming existing institutions, and then just as quickly recede and demobilize after succumbing to repression and dissension. A cycle of contention usually begins when "political opportunities" appear for well-placed "contenders." When they find their demands frustrated by authorities, they reframe their claims to draw in additional claimants. The "mobilization phase" is normally marked by the following: the rapid diffusion and intensification of conflict; the development of new routine forms of collective action (what theorists call repertoires); the appearance of new organizations and the expansion of existing ones; and the creation of new "master frames." The ensuing demobilization phase involves a mixture of participant exhaustion and organizational factionalism between radicals and moderates, followed by selective state repression and selective acceptance of movement demands.

Political opportunities converged in the mid-1880s from several sources. With the start of the 1883–1885 depression, a series of wage reductions spread across the Wabash rail system, in the hands of Wall Street tycoon Jay Gould. With Gould's railway running full bore to cover high fixed costs amidst falling prices, it could ill afford a strike. Just as critically, public opinion supported the railway workers, organized in a Knights' District Assembly. With the governors of three states arbitrating, the Knights beat back the wage reduction; the men won an additional strike in September 1885 using a boycott of the Wabash Railroad's rolling stock. Altogether in the 1884–1885 period, the order engaged in five railway strikes and won four of them.

All rail strikes in this era had national repercussions, but because this one involved a national organization with the grand pretension to organize the entire working class, its effect was nothing short of electric. The defeat of a large national corporation using the new weapon of the boycott greatly heartened workers. Once-fearful railroad workers flooded into the Knights assemblies, especially in the Midwest. Isolated local trade unions—the American Federation of Labor had not yet been born, and its predecessor, the Federation of Organized Trades and Labor Unions (FOTLU), was moribund—sought national-level solidarity by affiliating with the Knights. Accession of the

unions brought thousands of new members to the Knights.

Unorganized, unskilled workers also rushed into the order en masse. The list of entrants was nothing short of a cross section of the American working class: thousands of working women, many of them sweated garment workers from New York and Chicago; hundreds of African-American waiters, barbers, and printers, including thirty-five local assemblies in the Richmond area alone; Socialist German furniture craftsmen together with machine hands from the Midwest; and Polish rolling mill workers from Milwaukee all marched under the banner of the order. Nothing like it had ever been seen before, and the press, by exaggerating the organizational cohesion and effectiveness of the Knights, contributed mightily to its meteoric growth. Within a period of not more than six months, the Knights of Labor grew from a national organization of approximately 104,000 in 1885 to 725,000 in 1886.

A similar mix of opportunities helped the Knights win prestige and grow in mushroom style on the local level. In Chicago, the heart of the movement, local trades unions had benefited from the support of the Democratic Party regime of Mayor Carter Harrison. By refusing to use police to intervene during strikes in the early 1880s, Harrison enabled unions to defeat employers and establish footholds in the city's industrial economy. With the advent of falling prices during the 1883–1885 depression, unionized employers counterattacked, and these same unions struck again. This time the opportunity structure proved unfavorable.

Facing possible defection of anticorruption Democrats and criticism from the local Citizens Association and press for buying votes with his police policy, Harrison turned to a little known police captain. John Bonfield, to mollify employers. In protecting strikebreakers crossing picket lines in February 1886, the police forced local unions to turn to the Knights of Labor and the boycott as an alternative. When striking boxmakers, who had been stymied by Bonfield, won their struggle with the help of the Knights, and another Knights' boycott against prison-made shoes proved successful as well, the mood in the city shifted dramatically. In what one student of social movements has called a "moment of madness"—a time in which all things seem possible and social learning is intensified and telescoped in time—the Knights reaped a bountiful harvest of recruits. By late March, the *Chicago Tribune* reported that the local order was growing at the rate of a thousand per week. From 1885 to 1886, Chicago Knights had increased membership tenfold, and the number of workers on strike in the city had increased from 6,618 to 87,849. Similar moments of madness occurred in New York, Cincinnati, Milwaukee, Kansas City, and other cities following Knights' boycott or strike victories, though on a smaller scale than in Chicago.

In 1886, the Knights of Labor boasted a membership of more than 700,000, making it the largest working-class organization of the nineteenth century. The Knights quickly declined, however, racked by internal dissension and—as this 1887 cartoon shows—the unpopular leadership of Grand Master Workman Terence V. Powderley. *(Brown Brothers)*

Once within the fold of the order, workers gravitated toward the shorter hours movement, a demand that had long been a staple of the American labor movement. In 1884, the FOTLU had called for a strike on May 1, 1886, to institute an eight-hour day for American workers. In advance of the date, local Eight-Hour Associations formed in many cities to spread the word. The eight-hour demand was framed in a new way. Hitherto, it had been viewed as a means of uplifting workers as virtuous citizens of the republic; some Socialists supported the fight for eight hours as a way of accelerating the evolution away from wage labor and toward a new order of producers cooperation. The argument of the Eight Hour Leagues, however, was economic and social in nature. Shorter hours

would decrease unemployment, unite the interests of all workers, and increase consumer demand, thus counteracting overproduction. From 1886 to the turn of the century, the eight-hour day demand and its portrayal as labor's solution to depressions and unemployment would become the movement's new master frame.

For the short span of time between the success of the boycott and the May 1886 strike, the movement for the eight-hour day seemed to possess the force of a tidal wave. Almost 50,000 Chicago workers had won the demand by the end of April, and on May 1 another 60,000 struck. Nationally, New York had 45,000 strikers, Cincinnati 32,000, Baltimore 9,000, Milwaukee 7,000, and Boston, Pittsburgh, and Detroit each boasted between 3,000 and 4,700 strikers. Altogether, about 200,000 struck on May 1. Chicago's 35,000 packinghouse workers were the largest single group to win shorter hours. More lasting victories were won by building trades and cigarmaker unionists.

Just as the boycotting "mania" and shorter hours rage reached their peaks, a counterforce was gathering steam that would deal a crushing blow to the Great Upheaval. Internally, a brewing conflict between militants and moderates split the Knights asunder, leaving the entire movement vulnerable to attack. On March 13, 1886, Powderly issued a secret circular that disavowed Knights of Labor support for the May 1 strike. Nationally, the Knights were facing demands for strike funds and boycotts from tens of thousands of raw, undisciplined recruits, in addition to requests for support from viable bodies of trades unions. If the order had possessed a centralized strike fund, it might have been able to exert some control over the mania that had gripped the nation's workers. But, in contrast to the most advanced national unions, the order's strike fund was collected and controlled by local and state district assemblies. Powderly's circular was a desperate attempt to regain control over the distended order.

Exacerbating the difficulty of focusing the energies of the mushrooming shorter hours movement was the large-scale involvement of the Anarchists in Chicago. Although they had at first scorned the eight-hour day demand as a mere palliative, by fall 1885 they began to view it as an occasion for a mass strike that might be turned into a revolution. In furtherance of that goal, the Anarchists championed the demand of eight hours of work for ten hours of pay because it had less chance of being accepted by employers than the trade union demand of eight hours of work for eight hours of pay. When German furniture workers endorsed the more radical demand on April 10, the eight-hour movement in Chicago lost its unity, and the press began identifying the entire movement with anarchism.

By the end of the month, the formation of anti-union employers associations in the furniture, metal trades, and boot and shoe industries made it evident that employer resistance was stiffening. But the events of May 4, 1886, at Haymarket Square utterly demoralized the movement. Police under Bonfield confronted an Anarchist-convened meeting in Haymarket Square protesting the shooting of strikers the day before and ordered it to disperse. In almost the same instant, some unknown person threw a dynamite bomb into the ranks of the police. The exploding bomb killed at least four policemen, while the indiscriminate shooting by the remaining police killed at least another sixty people, including three fellow officers.

Called a "riot" by the press, the Haymarket Affair set off a widespread panic, kindling the nation's first major Red Scare. The press fed the public fear that a revolutionary conspiracy existed among foreign-born radicals to overthrow the Republic and called for the sternest actions to vindicate law and order. Under pressure from leading businessmen, Mayor Harrison banned public meetings and processions, and the police ruthlessly suppressed existing strike activities and arrested over two hundred Anarchist leaders and suspects. Eventually, eight leaders stood trial for murder and conspiracy, and four were hanged, even though the identity of the bomb thrower was never ascertained.

The Haymarket Affair gravely split the movement. Powderly condemned the Anarchists in terms indistinguishable from that of mainstream public opinion, while Samuel Gompers, newly elected president of the American Federation of Labor, condemned the violation of workers' civil liberties by the police and supported clemency for the Anarchists. Within the Knights of Labor, many criticized Powderly's one-sided attempt to disassociate the order from anarchism. All at once, it seemed, a major opposition movement had coalesced against Powderly, which would have important public repercussions on the order's ability to maintain the confidence of its members.

Even under the best of circumstances, however, it would have been difficult to prosecute strikes in the face of a public hysteria that conflated labor organizations with dangerous foreign radicalism. The Chicago garment leader Abraham Bisno wrote in his

KNIGHTS OF LABOR REPUDIATE AND DENOUNCE HIM

DAVID B. HILL 1888

The Knights of Labor, founded in 1869, became the leading national workers organization in the late nineteenth century. In the following document, the Elmira Local Assembly 1965 unanimously denounces the governor for his opposition to laws that would permit "a poor man" to compete for political office.

The following resolutions were unanimously adopted by Elmira Local Assembly 1965, K. of L., Oct. 2, 1888:

Whereas, On December 10, 1887, at a regular meeting of 1965 K. of L., a committee was appointed to draft resolutions for the purpose of petitioning the Legislature to amend the election laws by making it a criminal offense for any person to use money at any National, State, or Municipal election, in buying votes, knowing full well that in the purity of the ballot, free from the influence of money, depends the future welfare of our free institutions and the safety of our country; and

Whereas, On March 19, 1888, such a bill was introduced in the Senate by Senator J. Sloat Fassett, known as the "Anti-Bribery Bill," which passed the Senate and Assembly; this same bill having been earnestly supported by D.A. 15, K. of L.; therefore be it

Resolved, That we censure Governor D.B. Hill for not signing this bill, and for treating with such contempt the well known wishes of the K. of L., and a vast majority of law-abiding citizens.

Resolved, We, the K. of L., do also denounce and condemn Governor Hill for his action on the "Electoral Bill," known as the "Saxton Bill," a bill framed solely in the interests of the poor man; a bill which would enable a poor man to compete for an office with a man of wealth.

Resolved, That in withholding his assent to those two great measures, Governor Hill proves himself an enemy to the deserving poor man, and an ally of corruptionists.

Resolved, That we, the K. of L., will do our utmost to defeat Governor Hill for re-election to the office of Governor, and call on all labor organizations and law-abiding citizens to aid us in our endeavors to preserve a pure ballot.

Resolved, That we send a copy to each D.A. in the State, under the seal of the order, and that they be given to the press for publication.

Unanimously adopted.

autobiography (1967): "[P]icketing became absolutely impossible. The police arrested all pickets, even two or three. The attitude on the part of the police was practically the same as though the city was under martial law." Samuel Gompers observed, "[T]hat bomb not only killed the policemen, but it killed our eight-hour movement."

On the national level, the employer reaction occurred virtually at the same point in time. The Knights called a strike against Jay Gould's southwest system of railways on March 6, 1886, after a Knights member was discharged. Heretofore, public opinion and the support of public officials had aided the Knights. But in this affair the public was little interested, and the railroad refused arbitration. After a violent confrontation killed nine in East St. Louis, National Guard troops entered the fray. The order's public reputation suffered, and an unhappy Powderly gave the back-to-work order on May 4, the same day as the Haymarket bombing. In retrospect that date emerges as "the tipping point" of the Great Upheaval, the time at which mobilization turned into demobilization.

From that point onward, the Knights were beset with employer intransigence and state repression, compounding the difficulties created by internal dissension aired in public. The most notable case was the loss of the packinghouse workers strike in Chicago in fall 1886. The order, which had earlier been viewed as the savior of poor workingmen, suddenly appeared impotent. Meanwhile, well-placed trade unionists were able to win disputes with the aid of their national unions' strike funds. Local unions demanding "trade autonomy" left the order in droves for national unions of their trade. When the Knights responded by chartering more Trade District Assemblies (the equivalent of national unions), they triggered jurisdictional disputes with the national unions affiliated with the AFL. By 1888, the once mighty Chicago Knights of Labor had declined from 18,000 members in 1886 to about 3,000. Nationally during the same period, the Knights lost over two-thirds from their membership peak of 702,000.

The united front of the courts, public officials, and employers against the boycotts and strikes of labor

organizations beginning in March led activists to turn to independent labor parties. A comprehensive study of labor parties in 1886–1887 detected their existence in at least 189 American cities—including every large industrial center—in thirty-four out of thirty-eight states. In New York City a coalition of trade union and Knights leaders, Socialists, and Single Taxers nominated Henry George for mayor. In 1886, George finished second in a three-man race, winning 31 percent of the vote. In Chicago, a less distinguished candidate representing the same coalition won a like percentage of the mayoral vote in April 1887. In these and other cities a host of state legislators, city councilmen, and judges won office on the labor ticket.

Nonetheless, the impressive vote totals concealed two salient facts. The parties represented political protests against the use of the courts and the repressive apparatus of the state against the Great Upheaval. When the Great Upheaval dissipated and the repression let up, so did the protests. The new parties, moreover, were quite ambivalent about the long-term uses of the state to right the injustices in society.

Second, the major parties were willing to selectively endorse—thus coopting—many of the goals championed by the labor parties and thereby stealing their thunder. For example, in Chicago, the Republican mayor suspended Bonfield from the police force in 1889. Later that year, the newly elected Democratic mayor outdid the old Harrison regime by adopting important elements of the labor party's program, granting expanded patronage to union leaders, and reviving and extending the hands-off police policy during strikes. In short, the willingness of the democratic polity to partially meet the demands and concerns of the Great Upheaval and the moderating of the state's severe repression of 1886 kept workers from embracing either Anarchist insurrection or an independent labor party strategy.

Legacy of the Knights of Labor

Social movements are usually driven by grand ambitions. Not just the Anarchists, but the Knights of Labor, demanded an end to the wage system and the inclusion of all working people, whatever their skill level, nationality, race, or sex in the ranks of organized labor. Because circumstances frustrated these ambitions, and the Knights were succeeded by a more enduring but less inclusive and more pragmatic organization—the AFL and its affiliated national unions—historians have tended to paint the post–Great Upheaval period in broad-brush terms as one of defeat, disillusionment, and decline.

Recent social movement theory, however, provides us with a broader array of concepts and terms to assess outcomes. In between the extremes of outright defeat and victory, one popular typology offers the policy alternatives of preemption and cooptation. Another theorist stresses as an outcome the diffusion of new values and the politics of agenda setting; still others point to the creation of enduring networks of activists—a kind of "social capital" movement. In this latter category of enduring developments internal to the movement, we have the possibility of innovations in frames, repertoires (routine forms of collective action), and organizations. It is here that we note most obviously the long-term impact of the Knights of Labor and the Great Upheaval of which it was a vehicle.

Historians of the Gilded Age and Progressive Era often speak of that era as being characterized by an "organizational revolution." Large-scale, centralized organizations in the hands of professional managers using technical knowledge afforded Americans the capacity to bring order and purpose to chaotic and dysfunctional markets. Although the corporation most often comes to mind in this regard, workers too sought order, purpose, and control of markets through their own functional organizations. In this context, the Knights of Labor stands out as a series of related organizational hypotheses tested in the experience of the Great Upheaval. Notably, certain elements were found wanting. Activists found that geographically organized associations like the district assembly were relatively ineffective in focusing the energies of organized workers. In place of these community-based associations, labor activists, even within the Knights of Labor, turned to functionally organized and centrally controlled national unions. Other aspects of the Knights organization, however, survived and prospered, though within the confines of the national unions and the AFL.

The new master frame of the eight-hour day, which originated during the Great Upheaval, has already been mentioned as an innovation that dated to this period. The Knights also initiated industrial councils of related crafts—for example, in the metal, printing, building, and railway trades—which proliferated in the 1890s and the first decade of the twentieth century. Moreover, in the tradition of the solidarity manifested in the Knights, the AFL allowed the paramount craft in various industries to organize the entire industry under its wing. By 1890, the Knights' national district assembly of miners became the AFL's most influential industrial union, the United Mine Workers. The mixed local assembly combining

workers of different trades also survived the Knights in the form of the "federal labor unions" directly affiliated with the AFL (rather than national unions).

Even more significant for the future of the labor movement was the spread of new repertoires in the form of the boycott and the secondary boycott or sympathy strike. One form it took was the union label boycott. By the end of the 1880s, nine national unions had adopted the union label; eight of these nine unions began using it during the Great Upheaval. By the turn of the century, thirty-one different unions used the boycott. The sympathy strike also survived the Knights and reached its peak in the early 1890s, notably the Pullman strike and boycott. So effective and so widely used had the boycott become by the turn of the century that it sparked an Open Shop counterattack and the widespread use of the labor injunction. Notably, the 1880s Knights leaders had originated and popularized this new repertoire as an alternative to striking.

In sum, by taking the focus off the Knights of Labor as an organization with a discrete emergence, decline, and fall, and instead viewing the order from the perspective of a social movement, we find that the experience of the Knights in the era of the mid-1880s Great Upheaval had an enduring impact on the American labor movement's direction, methods, and organizational culture.

Miners' Movement in the West

West of the Mississippi River, class war between militant miners and corporations produced an early and genuine working-class culture attended by an indigenous radical unionism. Corporate intrusion into "people's" mining ground is a well-documented historical process in the United States—readily apparent not only in Western hard-rock mining but earlier, in the upper Mississippi Valley lead mines of the early 1800s and in the coal-mining communities of Pennsylvania beginning in the 1840s. In the lead mines, independent miners profitably worked publicly owned mines until driven out by a fledgling capitalist class that claimed the ground as private property—abetted by the relentlessly expansionist senator, Thomas Hart Benton. Physical violence against working miners and coercive legal practices figured prominently in this deliberate ouster of one class by another. More familiar are narratives of coal-mining wars in Pennsylvania that pitted encroaching coal and railroad companies against independent contract miners who set their own conditions of work and perceived contracts with companies as agreements between equals. In the heat of the Civil War, coal bosses disabused contract miners of these leveling ideas by meeting strikes with federal troops supplied by a government firmly committed to economic growth on the capitalist plan. Juxtaposed with class war in the lead and coal mines are the fundamentally egalitarian "southern mines" of Georgia during the gold rush of 1829. Although the violent displacement of native peoples to make way for mining cannot be ignored or downplayed here, thousands of miners, in the absence of a strong central government and powerful corporations, constructed in the Georgia mines their version of a "moral economy." Moral economies aim for an equitable division of resources intended to promote genuine participatory democracy. Workers in this period tended to perceive embryonic capitalist practices as amoral for granting privileged individuals complete freedom in their quest for profit—a freedom that undermined both community welfare and principles of democracy.

Working-Class Culture and the California Experience

Thousands of "Argonauts," or Forty-niners, streamed into the Sierra Nevada range of California with the discovery of gold in 1848. They clearly articulated the idea of the gold fields as the "people's mines," meaning they envisioned a vast economic region where workers themselves maintained control of production. Among the Argonauts we find Mississippi Valley lead miners, Pennsylvania coal miners, and veterans of the rush to the Georgia mines, many imbued with a strong sense of class consciousness and a strong distrust of concentrated power in any form. Immigrant miners with experience of industrial warfare abroad often shared this thinking and contributed their own home-grown class strategies. Many novice miners quickly assimilated this sense of worker militancy and upheld ideas of the dignity of independent manual labor within an egalitarian social structure.

Argonauts' journals and diaries reveal perceptions of California as an escape from the contradictions and inequities of the new capitalist order. Throughout the gold fields, ordinary miners organized regular mandatory meetings where they hammered out democratic codes of law that worked to both ensure participatory democracy and to obstruct capitalist practices. Mining laws both reflected the California experience and drew heavily from earlier Spanish and European practices dictating small claims intended to spread wealth and requiring claimants to work the ground regularly or give it up. In California, such laws discouraged holding claims for speculation and forbade the amassing of claims by individuals and small groups, thus upholding the dignity of man-

ual work. Argonauts policed themselves effectively through miners' courts. California's well-attended public hangings are most often construed as barbarism in action. Yet when compared with increasingly "hidden" executions in the East (behind prison walls), a case can be made that California represents a survival of older "republican crowd" actions with their affirmation of a people's right to fully participate in and draw moral instruction from all aspects of public life. As Argonauts followed subsequent gold and silver rushes into the interior, they put into service a repertoire of crowd actions as a means of asserting labor power. Vigilante actions in the West are often linked, especially in the popular media, to unruly mobs of miners, quick to implement summary justice. In truth, during later industrial wars, mining bosses and some elements of the middle classes far more often inflicted extralegal violence and terror on miners.

Producer (working-class) ideology and practices nurtured in California and imported to gold and silver rushes farther inland therefore embrace a moral economy, a propensity for radical participatory democracy, the use of various crowd actions, a discourse favoring independent "producerism," and the elevation of manual labor. Additional elements of an emerging working-class culture in California include a studied generosity in times of trouble, a thriving saloon and gambling culture, a grudging acceptance of women in the public sphere, and an assessment of wage work as fundamentally demeaning and degrading. Producerism certainly filtered into the constitutions of miners' unions later in the century, including documents taking a decidedly Socialist/Syndicalist turn. Striking miners also engaged in time-honored crowd tactics such as food riots, public humiliation of owners and managers, and protest marches carrying the tools of their trade—the pick and shovel. Union members gave generously to support striking miners and their families elsewhere. And in the absence of union halls, early organizing and union meetings often took place in saloons, which also served as hiring halls and temporary boarding houses. Miners' unions also established women's auxiliaries and women's unions, which played an important role in the economic and social life of many camps. Indeed, women sometimes took the places of their husbands, sons, and brothers during strikes, knowing that troops would be more reluctant to brutalize them. First nurtured in California, these beliefs and practices served miners and their families well as they built the most radical union movement in the nation, culminating in the Syndicalist Industrial Workers of the World.

The 1872 Mining Law: Privatization and Proletarianization

As a successful economic system, capitalism requires not only the commodification of goods and services, but more important, the commodification of human labor, so that work is transformed from the pursuit of subsistence and individual fulfillment into a product to be traded for profit in the marketplace. This process played out quickly in the mining camps of the West. The Mining Law of 1872, still essentially in effect today, helped ensure that corporations, not working miners, would control the nation's most valuable mining properties. The 1872 law overturned the federal government's original vision for public mineral lands as demonstrated in the Mississippi lead mines—a project of leasing mines to independent producers who would turn over a portion of their income to the government in the form of royalties.

The 1872 law was a direct attack on local common-law mining codes grounded in the California experience, which prevented rich ground from falling into the hands of speculators and capitalists. California laws that strictly limited claim size also required that mining ground be regularly worked or forfeited. That is, miners owned their ground only as long as they worked it. The 1872 law nullified all local mining common law, giving hegemony over mineral law to the legislatures of individual states and territories—government entities that, from the beginning, used the law and the court system to sanction, encourage, and smooth the path of capitalist state formation. In this vein, the 1872 law included the claim-patent system, which grants secure or free title (unrestricted permanent ownership) to claim holders. Secure ownership also gives possessors, whether individuals or corporations, the right to bring suit. When small claim holders refused to sell out, corporations simply engaged them in crippling lawsuits over a variety of issues. Expensive, lengthy litigation nearly always forced a sale, since judges suspended independents from active mining during these prolonged show trials.

The mines on Nevada's Comstock lode were notorious for generating costly litigation between mining barons, who in turn were famous for using shady legal tactics against the independent miners who first located the silver. The example of Immanuel Penrod, one of the original locators of the district, demonstrates capitalist state formation in action. California capitalists descended on the district following the discovery of high-grade silver in 1859 and made a prac-

tice of taking into partnership independent claim owners, such as Penrod, who refused to sell and insisted on a partnership. Penrod's new partners made use of the "freeze-out" strategy, assessing his personal funds to build an expensive new mill, at a cost well beyond his means. Penrod sold his interest for $5,500, a trifle considering the millions his claim yielded later. In 1863, Comstock capitalists used their influence with lawmakers to pass a measure legitimizing the freeze-out.

The claim-patent system also worked to effectively privatize the nation's Western mines, in converting them from public to private ownership. Until the 1872 law went into effect, the federal government understood mining on public lands in the West as legal trespass, though it seldom acted to evict—mainly because local police and militia tended also to be local miners who fought back. Working miners in turn regarded mining ground as a sort of mineral commons, open to those who intended to work the ground (with the notable exclusion from the commons of native peoples and other excluded groups, especially Hispanics and Chinese in the West). The claim-patent system, in allowing permanent ownership to those who spent $500 on claim "improvements," thus privatized the ground—the people's mines—for $500 and a nominal fee. Royalties are also basically dispensed with, so that the 1872 law stands as a massive giveaway of public lands to a privileged class. After 1872, with secure title guaranteed, capitalists, domestic and foreign, poured money into Western mines.

The Comstock Unions

Not surprisingly, as corporations consolidated in Nevada, some of the most militant and long-lived miners' unions emerged on the Comstock, the nerve center of early industrial mining in the West. For independent miners forced from their claims and for most newcomers to the district, despised wagework presented the only option. Most historians assign the later stimulus and style of unionism in the West to the Comstock model. From the beginning, miners fought mine owners, an understandable development, considering the aversion of the miners to take on highly dangerous and unhealthy underground work for the substandard wages offered by the mine owners. An initial labor shortage obliged big companies to offer $4 a day, barely adequate pay in light of the astronomical cost of living in Virginia City. In 1863, rumors of a pay cut led the miners to organize a protective association intended to preserve the $4 day, aid members in need, and end wildcat speculation in mining stocks, which often led to the closing of mines. Frequent shutdowns in mines throughout the West cut sharply into wages that some historians construe as unusually generous.

Although the protective association did not comprise a formal union, it represented a fundamental and venerable component of working-class formation under capitalism. In a town less than five years old, the materialization of such an organization signals both rapid capitalist state formation and a perceived need of workers to protect themselves as a class. The following year, in response to losses incurred by expensive lawsuits, runaway speculation, and mismanagement, Comstock companies attempted to economize by dropping wages to $3.50 a day. Absentee owners of the Uncle Sam mine acted first, with orders to foreman John Trembath to announce the cut. On March 19, 1864, an assembly of miners answered the challenge by affixing Trembath to the main hoist with ropes, attaching the label "dump this pile of waste from Cornwall," and requesting the hoist engineer to raise and lower the foreman a few times along the length of the main shaft. Trembath, greatly subdued, insisted that he acted on company orders. The company, lacking strong military or police backing, rescinded the order but bided its time. Lack of police and military power reflected the miners' policy of appointing and electing their own as enforcers of the law, militia members, and firefighters. Early on, unions recognized the power of such arrangements and used the vote and volunteerism to obtain them. As long as power struggles remained local, this tactic succeeded admirably.

In response to worker mobilization, Virginia City mining companies met secretly to propose and carry out antilabor policies, such as the blacklisting of leaders and the drafting of secret agreements with a number of anti-union miners to work below the living wage. The outcome was a disappointment, however. When owners announced an across-the-board wage cut to $3.50 in July 1864, the miners engaged in a two-day disciplined crowd action to show their collective strength. On the first day, they marched behind the Gold Hill Brass Band in a parade of solidarity and listened to a speech by Frank Tilford, a friendly judge, who announced that reducing wages meant driving the miners to "despair and death." The charge was not unfounded, considering how coal companies in the East utilized wage cuts, expanded hours of work, juridical attacks, and seasonal work—cumulatively, owners intended these measures to drive miners and

their families to the edge of starvation and into submission. On the second day, the miners spoke for themselves. Carrying the picks, sledges, and shovels of their trade, they marched on each Comstock mine and mill, giving notice to managers that the $4 wage would stand. Every foreman promised compliance, perhaps mindful of both Trembath's experience and Judge Tilford's speech the day before, likening mining companies to ancient Roman traitors who were punished by tossing them from the Tarpeian rock adorned with girdles of burning faggots.

Most significantly, on August 6, the miners proclaimed the birth of a new union, the Miners' League of Storey County, dedicated to the preservation of the $4 day for all underground workers—signifying a bona fide industrial union. The league encompassed unions in Virginia City, Gold Hill, and Silver City, towns built around the mines. New members pledged to work for no less than $4, to discover men who worked for less and expose them to public humiliation, and to accept wages paid only in silver or gold (rather than scrip). Predictably, members swore to march on offending companies and convince them, by force of numbers, to rethink inequitable policies. A sustained class struggle followed, with the unions, supportive townspeople, and newspapers on one side, arrayed against the big companies and some elements of the small middle class. Owners could not profitably fire united union men en masse and so resorted to the weak expedient of dismissing leaders by concocting dubious charges unrelated to unionism. Companies also continued secret hirings below the standard wage.

In September, to counter continuing corporate tactics, the Miners' League debated the establishment of a union camp on the Comstock. Termed a "closed shop" by anti-union propagandists, a union camp or union "shop" requires all prospective workers to join a union before applying for work. In using the expression "closed shop" to denote an arbitrary and coercive forcing of workers into unions, mine owners ignored the function of unions to protect and further the interests and rights of all workers. Within a few decades, some mining towns, such as Butte, Montana, stood as genuine union camps, with virtually every occupation unionized, including those dominated by women. The possibility of a union camp led Governor James Nye, a mine owner, to summon two companies of calvary, armed to the teeth, to Virginia City in a bid to dissuade the league from its purpose. To avert a bloodbath, the Miners' League wisely postponed the union camp decision but temporarily weakened the organizing impulse, allowing owners to hire increasing numbers of miners for $3.50. Mine owners got up their own "league," the Citizens' Protective Association, to disseminate a public discourse representing capitalists as guardians of democracy, intent on upholding the rights of individual miners to "choose" union membership. Companies avoided carrying this discourse to its logical conclusion—that miners would freely elect to descend underground and risk their lives and health for less than $4 a day.

A second mining boom on the Comstock in 1866 worked to the miners' advantage by producing a new labor shortage. This time the miners, beaten down once by management, restructured the union and committed themselves to a union camp. The original preamble to their constitution described the "tyrannical oppressive power of Capital" (a response, perhaps, to Nye's troops) and the enormous capability of workers to redress the imbalance. A contingent of conciliatory union men persuaded their more radical brothers to moderate the militant tone for public consumption, but members continued to use the original preamble at meetings and induction ceremonies. This time the union prevailed, safeguarding the $4 day and establishing an eight-hour shift until the bonanza ore played out in the 1880s. Mine bosses had no choice but to comply; attacks on these rights meant a general strike and the shutdown of production. In the deep mines of the Comstock, a strike of all workers also posed the danger of pump operators walking off the job and the consequent flooding of the mines. The miners' victory rested on solidarity—a general consensus for both a union camp and an industrial brand of unionism that extended the living wage and reduced hours to all miners regardless of skill or job status. Comstock unions also built up social weight by using dues to provide critical social services for miners and their families, including sick benefits and money for funeral expenses. Other union contributions to Virginia City and its suburbs included the camp's only public library and an excellent private hospital.

Collective action on the Comstock marked the emergence of a genuine working-class culture in the mines of the West and the appearance of class consciousness among workers in the context of capitalist state formation. Thousands of Comstock miners carried a discourse of self-help and mutualism to industrializing camps throughout the West and inspired armies of Western miners to press for industrial unionism and the union shop. Toward the turn of the century, many miners would go a step further and

Striking miners stand at the site of their tent colony, destroyed by the state militia in Forbes, Colorado. Capital–labor violence—with the government often intervening on behalf of management—was endemic in the West in the late nineteenth and early twentieth centuries. *(Denver Public Library)*

adopt clear Socialist ideals and objectives. Through it all, miners' militancy and the determination of mining companies to dictate all conditions of work guaranteed endemic class war. As new camps took shape, miners articulated and put into practice a mission to preserve the dignity of labor, to ensure workplace democracy, and to force adequate compensation for dangerous and difficult work. Not all miners, of course, shared this sense of militancy; nor should we minimize policies of racism and exclusion directed against targeted groups. Still, as miners' unions grew more radical, they tended to grow more inclusive of marginalized groups.

Capital–Labor Wars in the Coeur d'Alenes

In the rich silver mines of Idaho, workers' struggles against absentee corporations played an important role in founding the radical Western Federation of Miners (WFM), which in turn influenced the organizing of the Syndicalist Industrial Workers of the World. Idaho miners responded to the ongoing corporate deskilling and degrading of labor by forging a district federation of local unions. Local Idaho unions adopted the Virginia City model and federated almost as quickly as corporate interests took over the mines. In 1887, Simon Reed, owner of the newly incorporated Bunker Hill and Sullivan Mining Company (BH&S), based at Wardner, announced a cut in the customary wage for all underground workers from the Butte scale of $3.50 a day (won by Butte miners in 1878) to $3.00 for skilled miners and $2.50 for unskilled men. Reed, in using wages to distinguish skill levels, intended the cut to erode worker solidarity. To compound the insult, he introduced deadly Burleigh machine drills in place of skilled hand-drilling meth-

ods. Although Burleigh drills, called "widow makers" by the miners, sped up production and increased profits, they also spewed fatal clouds of silica dust into the still underground air. Razor-sharp particles of dust, still a health hazard in mines today, lodge in the lungs and trace a network of scars that eventually asphyxiate the victim. Silicosis, also called "miners' con" (consumption) or "black lung" by coal miners, is responsible historically for the deaths of thousands of American miners. This danger, coupled with the possibility of death or permanent injury underground, makes militancy in response to owners' pronouncements no surprise.

Historian Richard Lingenfelter's graphic description of underground dangers in *The Hardrock Miners* (1974) aids greatly in understanding the brand of radicalism that characterized the Idaho miners:

> He could be blown to bits in an explosion, drowned in a sump, suffocated and incinerated in a fire, scalded by hot water, crushed by falling rocks or cave-ins, wound up in the machinery, ground under the wheels of an ore car, have his head split open with an ax or pick, his neck broken by being run up into the hoist frame, or his whole body smashed out of shape and reduced to a pulp, or ripped apart and scattered in shreds by falling down a shaft. Moreover [with the introduction of new technologies] new accidents were constantly happening, the likes of which were never before heard of.

In the year of its incorporation, Bunker Hill and Sullivan policies led to the secret organization of unions in the scattered silver camps. These unions soon announced their presence by winning minor concessions from smaller companies in the district, then by coming together and federating early in 1891, as the Miners' Union of the Coeur d'Alenes. By summer, the federation employed a series of strikes to restore the $3.50 day at all but the BH&S mines. The empowered union then resolved to go after BH&S, now controlled by powerful San Francisco and Eastern capitalists, including the Guggenheim family and Cyrus McCormick. Besides the wage issue, BH&S miners strongly resented the "check-off" in which the company deducted $1 a month from each man's paycheck to subsidize a substandard health care system and retained the balance as profit. Union members determined to recover the check-off money and build a first-class hospital with a competent staff.

To enforce their demands for an end to the check-off and an across-the-board living wage of $3.50, miners walked off the job late in the summer of 1891. Company president John Jays Hammond telegraphed superintendent Victor Clement to avoid at all costs giving into these demands. Clement floundered at first. Sheriff Cunningham of Wardner owed his election to the miners and refused to send deputies to the mine to break up the strike. Nonminers in the camps repudiated offers from the company to scab. In the absence of district support and in the face of plummeting profits, the company agreed to both demands in late summer, determined to renege in due time.

A newly organized Mine Owners' Protective Association (MOPA) appeared in the district in October, bent on beating down the $3.50 day and crushing the union. On the advice of lawyers, the MOPA hired industrial spies (Pinkertons and Thiel detectives) to infiltrate local unions. As the livelihood of spies rested on detecting "sedition" among the miners, they predictably found "anarchists" lurking in every underground tunnel. Then, without warning, in January 1892, the MOPA shut down nearly every mine in the district, except the smallest, throwing 2,000 men, many with families, out of work in the dead of winter. Yet the ploy backfired. Local farmers supplied the strikers with wagon-loads of food, and the federation made use of its own well-stocked commissary. In desperation, again on the advice of company lawyers, the MOPA turned to the importation of scab labor. Obliging railroad companies rushed trainloads of scabs into the district, and high court judges barred miners from interfering in any way with the process. By June, the mines resumed full production with scab labor. Still the miners persevered, recruiting perhaps one-half of the scab workers to their side. Thousands of dollars continued to pour in regularly from outside unions in support of the workers. The membership of the large Butte Miners' Union, for example, assessed each man $5 per month for their Idaho comrades until the strike ended.

As the summer wore on, tension heightened among miners, mine guards, and scabs as BH&S anticipated the outbreak of violence. On July 10, the company rejoiced when a gun battle broke out between Gem and Frisco mine guards and striking miners. Three miners and three guards died in a rain of bullets. Miners proceeded to capture both mines and take 150 scab prisoners, whom they loaded in boxcars and dispatched from the district. Throughout the district, miners engaged in similar actions, clearing the Coeur d'Alenes of scab labor and occupying the mines. These events not only gratified mine owners, who could now call in troops, but alarmed the camps'

prosperous middle classes to the extent that some withdrew support from the workers. Military and vigilante action became the order of the day as Governor Wiley declared martial law and called on President Benjamin Harrison for aid. State and federal troops converged on the district on July 14, and despite meeting no resistance, rounded up hundreds of miners (sources report up to 1,000 men), and confined them for two months in filthy stockades called "bull pens," in which three men eventually died. Local residents who supported the companies used the opportunity not only to aid in the roundup, but to engage in a witch hunt against personal enemies and business competitors by accusing them of supporting the miners. Enforcers of martial law ordered union commissaries closed, officials elected by union vote removed from office, and the closing of mines whose owners bargained with the unions. Until March 1893, when a U.S. Supreme Court decision cleared every miner of criminal charges, the charged men experienced grave violations of their civil rights that tended to further radicalize them rather than render them docile. Indeed, veterans of the Coeur d'Alenes bull pens figure prominently as original members of the Westchester Federation of Miners (WFM).

The frustrating experiences of Idaho miners and similar occurrences in industrializing camps elsewhere in the West led to the organization in 1893, in Butte, of the WFM, which successfully brought together smaller district federations throughout the mining West. The Butte Miners' Union ranked as the nation's largest local industrial union in this "Gibraltar of Unionism," while Butte itself stood as the second-fastest-growing city in the country. Extraordinarily rich in copper and other metals, Butte boasted a crazy-quilt of bustling ethnic neighborhoods, a rich cultural life, and a remarkable degree of worker solidarity. In the spring of 1893, the recent specter of the Idaho bull pens produced a sense of crisis that led representatives of seventeen local unions throughout the West to converge on the city to organize a miners' federation that would match the national power of corporations. The 1893 WFM constitution welcomed all workers involved in mining and processing ore, including coal miners. This founding document is a mixture of bread-and-butter issues and incipient socialism; the latter appeared in full force in subsequent constitutions. The 1893 founders called for economic justice, major improvements in mine safety and independent inspectors to enforce them, payment of wages in lawful money rather than company scrip, the abolition of company stores and housing, a ban on employment of boys under sixteen in the mines, and the interdiction of industrial spies, private mine guards, contract labor, and all conspiracy laws that trampled the rights of miners as citizens.

As the turn of the century approached and then passed, industrial warfare in the mines of the West intensified. WFM leaders along with many rank-and-file members veered decidedly left. Hasty industrialization of the mines by a capitalist class determined to maximize profit in the shortest time played a crucial role in the process. Corporate mining requires heavy capitalization, and investors are disinclined to wait long for dividends; paying a living wage, providing basic benefits, and attending to mine safety cut into anticipated profits. By 1901, we find delegates to WFM conventions demanding the "emancipation of the toiler" and "a complete revolution of present social and economic conditions . . . that justice be meted out to all people of the earth."

Sentiments such as these attracted the attention of labor leader Eugene Debs. He perceived the bare-knuckles nature of capital–labor wars in the West as proof of his conviction that workplace struggles involving direct action produced the most meaningful and lasting social and economic change. More conservative Socialists of the period (better termed "progressives") favored the ballot box and working through established political parties over shop-floor agitation as the means to a more egalitarian order. In June 1905, as mine bosses showed no sign of negotiating fairly with workers and every inclination of persevering in their crusade to destroy WFM locals, the federation dispatched leaders and delegates to a meeting in Chicago. There, 186 delegates representing 40,000 workers organized the Syndicalist Industrial Workers of the World, commonly called the "Wobblies." WFM delegates represented some 27,000 miners, comprising by far the largest occupational group. Labor luminaries included Debs; president Charles Moyer of the WFM; labor activist Mary Harris "Mother" Jones; Lucy Parsons, wife of Haymarket martyr Albert Parsons; Socialist Labor Party president Daniel DeLeon; and "Big Bill" Haywood, veteran of the Idaho bull pens and WFM leader. Haywood and Moyer sat on the executive board at the pleasure of the rank and file, which held the right of recall. The IWW recruited workers in all occupations, regardless of skill, gender, or race, standing in sharp contrast to the larger AFL, which recruited skilled, white, male workers. The Wobblies also promoted a Socialist agenda of the most radical tone. According to the original preamble:

> The working class and the employing class have nothing in common. There can be no peace so long as hunger and want are found among millions of working people and the few, who make up the employing class, have all the good things of life. Between these two classes a struggle must go on until all the toilers come together on the political, as well as on the industrial field, and take and hold that which they produce by their labor through an economic organization of the working class, without affiliation with any political party.

A later version of the preamble pulled no punches and called for outright abolition of the wage system.

WFM president Moyer abruptly withdrew the federation from the IWW in 1907, perhaps in reaction to his narrow escape with Big Bill Haywood from a 1905 murder frame-up. Clarence Darrow would defend the pair in a trial that absorbed the nation's attention for months. Moyer's disassociation of the federation from the IWW did little to dampen the enthusiasm of ordinary miners for the Wobbly project. Many retained membership in both the WFM and (often secretly) in the IWW until relentless persecution by an alliance of big business, the state, and the middle classes during World War I stopped Wobbly Syndicalism dead in its tracks. In 1916, WFM leaders, growing ever more conservative, rechristened the organization the International Union of Mine, Mill, and Smelter Workers and focused increasingly on bread-and-butter issues. Debs, too, broke with the IWW in 1908 over the Wobblies' espousal of implementing workplace sabotage when necessary in waging class war. Haywood, however, remained with the Wobblies until the patriotic hysteria of World War I opened the way for his conviction under the Espionage Act for opposition to the war. He escaped to Russia, where he died in 1928.

Precisely defined, "radical" denotes going to the root of a thing, as in radical change or reform. Just as American revolutionaries sought radical reform in declaring war on England in 1776, Western miners perceived themselves as very much in the mainstream of this American tradition of righteous resistance. In the West, miners took the democracy project seriously and fought to vest social, political, and economic control in the hands of the people, rather than giving it over to a self-interested few. Miners and their families also constructed a genuine working-class culture in the camps. They not only resisted capitalist culture, but contested it with a coherent alternative vision of America that appealed to many. Finally, the failure of miners and their supporters to shape a more egalitarian society in the decades around the turn of the twentieth century can be traced more to the implementation of various forms of physical and legal coercion by corporations and the state than to any disunity among miners or to a weak or flawed producers' rationale.

Anarchism and the Labor Movement

The historian Paul Avrich notes in *Anarchist Portraits* (1988), "Of all the major movements of social reform, anarchism has been subject to the grossest distortions of its nature and objectives." Indeed, no political philosophy has been as demonized and misrepresented as Anarchism. Anarchism in its most basic formulation simply means the absence of government, not the absence of organizational structures. Specifically, Anarchism is the political belief that society should have no government, laws, police, or other authority, but should be a free association of all its members. Portrayed as the refuge of scoundrels and deviants, Anarchism actually played an influential role in the development and growth of the labor movement in Europe and the Americas.

Anarchism was present in the United States prior to the arrival of European activists. However, North American Anarchism lacked the activist orientation of European Anarchism because it tended to be more individualistic and disdained attempts to organize cohesive federations. At this time, it was essentially a philosophical and pacifist movement. In the United States, the most significant figure in the Anarchist movement was Benjamin Tucker. In his journal *Liberty*, he published the work of European Anarchists, including Peter Kropotkin, Mikhail Bakunin, and Leo Tolstoy.

Avrich notes in *The Haymarket Tragedy* (1984): "Representatives from twenty-six cities met in Pittsburgh to form the revolutionary socialist and anarchist groups into one body, the International Working Peoples Association. The formative period of its history was marked by three important events: the London Social Revolutionary Congress of July 1881, the Chicago Social Revolutionary Congress of October 1881, and the arrival of Johann Most in America in 1882."

The Influence of European Émigrés

Radical Anarchism arrived in the United States through European émigrés fleeing political repression (e.g., the anti-Socialist laws passed in Germany in 1878–1879, the pogroms in the Russian Pale, etc.) or seeking economic opportunity. Despite its international pretensions, Anarchism developed in European ethnic communities—Russian, Italian, Jewish, and so on. An exemplar of this is Johann Most, a committed Socialist and early member of the International Working Men's Association (the First International). In 1874, he was elected to the German Reichstag, but after passage of anti-Socialist laws he was forced to flee the country.

When Most was released from prison in 1882 (he had called for the assassination of Tsar Alexander II), he immigrated to the United States and settled in Chicago. Most published the newspaper *Die Freiheit* and soon became the best-known Anarchist in America. His views were incredibly influential among German and Yiddish-speaking Anarchists in the United States. He argued that the state should be ruled by a collective group of citizens. He believed that before this could happen people would have to use violence to overthrow the government. He even compiled a text explicating the construction and use of explosive devices, *The Science of Revolutionary Warfare* (1885).

In addition to the outspoken Most, many other German Anarchists were active in the movement. Perhaps the most well known are the Haymarket defendants Albert Parsons, August Spies, Adolph Fischer, George Engel, Michael Schwar, Samuel Fielden, Oscar Neebe, and Louis Lingg. Although they had their share of differences, Parsons, Spies, Schwab, and the other Haymarket defendants were exemplars of the Chicago Idea, named after the convention of social revolutionary groups assembled in Chicago in Octo-

ber 1881. They were advocates of union organization, direct action, and avoidance of electoral politics. All were active in the struggle for the eight-hour day and were also committed to armed self-defense.

The Haymarket Affair

In 1886, a series of strikes swept in and around Chicago. At the McCormick Reaper Works, August Spies was addressing a crowd of workers when the scabs left the factory. An intense battle erupted. The police were called in, and when pelted with stones they opened fire on the crowd, shooting indiscriminately at the men, women, and children. The police killed six and wounded more.

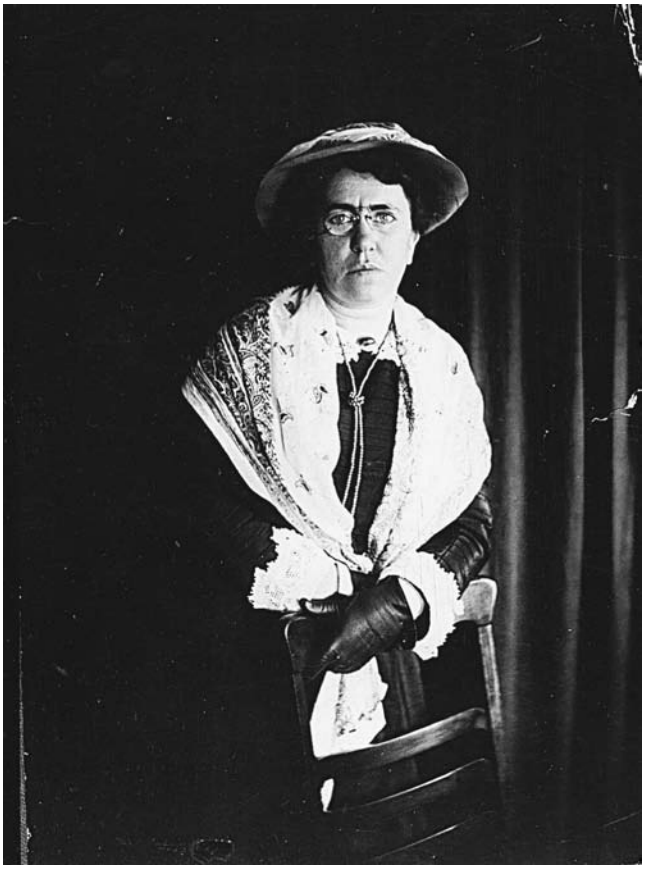
The following evening, May 4, a mass meeting was called at the Haymarket. About 2,000 workers attended the meeting, far short of the 20,000 Spies originally expected. The mayor observed the activities, and when he was satisfied that they posed no danger, left the scene. However, Chicago police captain Bonfield sent over 170 policemen to the scene to break up the small crowd that remained. Captain Ward, the officer in charge at the scene, demanded that the meeting disperse. As Samuel Fielden began to explain to the officers that the meeting was peaceful, a bomb was thrown into the group of policemen. The police reacted by emptying their pistols into the crowd, once again shooting men, women, and children. Although the bomb killed one to two policemen at most, more were killed due to friendly fire. The numbers of injured workers remain unknown because many were afraid to go to the hospital in the belief that they would be turned in to the authorities and persecuted.

The press was quick to blame the Anarchists in headlines such as "Chicago Anarchists Throw Bomb in Midst of Police" and "Anarchy's Red Hand," and called for severe reprisals. Anarchism was linked to immigrants and was said to be an "alien doctrine" of the "scum and offal" of the Old World. Even labor joined the hue and cry. Typographical Union No. 16, notwithstanding Parsons's membership, adopted a resolution denouncing "the heinous acts of the mob at the Haymarket" and offered a reward of $100 for the capture of the bomb thrower. The Knights of Labor also ignored Parsons's longtime association with the organization, while the Grand Master Workman of the order, Terrence W. Powderly, made frantic efforts to dissociate his organization from the Anarchists. Although the authorities were unable to identify the bomb thrower, Parsons, Spies, Fischer, Lingg, and Engel—organizers of the Haymarket meeting—were sentenced to death for "conspiracy to murder."

Jewish Influence in the Anarchist Movement

The Haymarket trial precipitated the formation of the first Jewish Anarchist group in the United States, the Pioneers of Liberty (*Pionire der Frayhayt*), who affiliated themselves with the International Working People's Association. They were also greatly influenced by Most. Their inauguration occurred on October 9, 1886, the day that the sentences were handed down. Their initial task was to prevent the execution of the Haymarket defendants. To this end, they held meetings, sponsored rallies, and gathered funds for judicial appeals. Their first paper, *Varhayt* (Truth) (1889), was short-lived (five months, twenty issues). However their subsequent effort, *Freie Arbeiter Stimme* (Free Voice of Labor) (1890) lasted eighty-seven years.

The *Freie Arbeiter Stimme* claimed to represent



Anarchist, feminist, and passionate advocate of personal liberation, "Red Emma" Goldman spoke widely on behalf of workers and the poor. *(Brown Brothers)*

EMMA GOLDMAN (1869–1940)

Emma Goldman was born to Abraham and Taube Goldman in a middle-class Jewish family in Kovno, Russia (now part of Lithuania) on June 27, 1869. Influenced by radical politics as a young teenager, she began working in garment factories in St. Petersburg. She later went to America to join an older sister in Rochester, New York, where she worked as a seamstress and was briefly married. Outraged by the execution of the Haymarket Square Anarchists, Goldman moved to New York City at age twenty to become a radical activist.

Goldman became a popular speaker, making several cross-country lecture tours and numerous visits to Europe. A fervent Anarchist, she advocated for free speech, labor rights, birth control, and women's equality. A proponent of free love, she critiqued traditional marriage and supported the rights of prostitutes. She combined class, gender, and sexual politics, declining to join groups focused exclusively on women's issues. Goldman wrote widely and published the radical magazine *Mother Earth;* among her most well-known works are *The Traffic in Women and Other Essays on Feminism* (1971) and her autobiography *Living My Life* (1931).

Goldman was committed to personal freedom, believing that anarchism "stands for the liberation of the human mind from the dominion of religion; the liberation of the human body from the dominion of property . . . an order that will guarantee to every human being free access to the earth and full enjoyment of the necessities of life, according to individual desires, tastes, and inclinations." Her belief in personal liberty is exemplified by a story in her autobiography in which a fellow activist told her that her dancing did not behoove a political agitator. She wrote, "I did not believe that a cause which stood for a beautiful ideal, for anarchism, for release and freedom from conventions and prejudice, should demand the denial of life and joy. . . . If it meant that, I did not want it." From this was derived the most famous quote attributed to Goldman—"If I can't dance, I don't want to be part of your revolution"—which she never actually said.

In her early years, Goldman supported "propaganda by deed," although her later experiences led her to reject terrorism. In 1892, she and Alexander Berkman planned to assassinate Henry Clay Frick, who suppressed the Homestead strike in Pittsburgh; Berkman injured but did not kill Frick and was sentenced to prison. Goldman's lectures were routinely disrupted by authorities, and she was imprisoned on various occasions for incitement to riot, distributing birth control information, and organizing against World War I and the draft. Some of her works were suppressed under the Comstock anti-obscenity laws. As the country's most well-known proponent of anarchism, Goldman was hounded after Anarchist Leon Czolgosz assassinated President William McKinley in 1901. In 1919, she and Berkman were deported to Russia.

Although she had supported the Russian Revolution while in America, "Red Emma" became increasingly disillusioned with the Bolsheviks after witnessing increased bureaucratization, political persecution, and Leon Trotsky's violent suppression of the Kronstadt rebellion. In 1921, she left Russia for England. In 1936, she went to Spain to support the Anarchists fighting Generalissimo Franco's fascists in the Spanish Civil War. Goldman died in Toronto in 1940 and is buried in Chicago near the Haymarket Anarchists.

Liz Highleyman

thirty-two Jewish workers' associations and in Avrich's words, "combined the functions of a labor paper, a journal of radical opinion, a literary magazine, and a people's university." Its most well-known editors were David Edelstadt, the Yiddish labor poet, and Saul Yanovsky, who steered the paper away from "propaganda of the deed" as advocated by Most and toward more mainstream and reformist efforts like union organizing.

During the four years from 1886 to 1890, Anarchism emerged as probably the largest and certainly the most dynamic movement among Jewish radicals in the United States. The Jewish Anarchists, predominantly workers, took part in the first strikes against sweatshop labor and helped organize some of the first Jewish trade unions, such as those of the New York cloakmakers and kneepants workers.

Another key event of the period was the attempt by Alexander Berkman (a Pioneers of Liberty member) on the life of Henry Clay Frick, manager of the Carnegie steelworks near Pittsburgh. Berkman's act was in retaliation for the violence meted against workers during the Homestead Steel Strike of 1892. Touring the country raising money for Berkman's defense catapulted Emma Goldman into the political limelight. A fiery orator and talented editor of *Mother Earth*, she was active in a number of labor causes, including decrying the Triangle Shirtwaist Fire and publishing articles defending Tom Mooney and Warren Billings.

In the early 1900s, emphasis in the Jewish Anarchist community began to shift away from individual acts of violence toward the organization of unions in all trades in which Jewish workers were employed—from bookbinding and cigarmaking to tailoring and housepainting. They were especially active in the International Ladies' Garment Workers' Union (ILGWU) and in the Amalgamated Clothing Workers of America (ACWA), participating in strikes, rooting out corruption, and fighting against bureaucracy and indifference.

They were also active in the *Arbeiter Ring*, or Workmen's Circle, a Socialist fraternal order in North America that provided life insurance, sickness and accident benefits, burial plots, and educational and cultural programs. Between 1910 and 1918, at least ten Jewish Anarchist groups existed in New York alone. By the 1920s, Anarchist branches were established in New York, Philadelphia, Baltimore, and Los Angeles. The Jewish Anarchists were also engaged in a variety of cooperative endeavors in New York and developed by the ILGWU and ACWA.

Besides the Jewish Anarchists, Russian workers also organized themselves. At the peak of its membership, the Union of Russian Workers in the United States and Canada numbered nearly 10,000 members. Italian Anarchists also played a role in the unions but disdained leadership positions owing to the anti-organization influence of their leader Luigi Galleani. Nonetheless, they were active in demonstrations and

Emma Goldman addresses a meeting of the National Federation of Labor in London, England, on January 20, 1937. Goldman had spoken out against imperialism, fascism, and oppression. *(AP Wide World Photos)*

strikes in Lawrence, Massachusetts (1912), Paterson, New Jersey (1913), and Plymouth, Massachusetts (1916).

International Forces

Anarcho-syndicalism, the amalgamation of Anarchist ideology with the structure of a trade union, never caught on in the United States. This does not discount the fact that anarcho-syndicalists were active in the United States. However, they never formed anarcho-syndicalist unions. Nonetheless, the revolutionary Syndicalist Industrial Workers of the World (or Wobblies) placed an emphasis on direct action and self-organization of the working-class. In contrast to the slogan of Samuel Gompers's American Federation of Labor, "Honest pay for an honest day's work," the Wobblies called for "Abolition of the wage system," which they termed wage slavery. As a result, the press and government derided them as Communists, Anarchists, and criminals. When the Wobblies and Anarchists took an antimilitarist position during World War I, they were thrown in jail and in some cases deported.

During the Red Scare in 1919, a large number of Anarchists, including Emma Goldman and Alexander Berkman, were deported from the United States. Some historians have argued that Nicola Sacco and Bartolomeo Vanzetti, two Italian immigrants found guilty of murder, were both executed in 1927 for their Anarchist beliefs. Unlike its stance in the Haymarket affair, labor rallied to the case of Sacco and Vanzetti but to no avail.

In the early part of the twentieth century, the lure of the Bolshevik Revolution, the Red Scare, the Palmer Raids, and deportations had a disastrous impact on the Anarchist movement in the United States—one from which it would never recover. With its leadership in prison or deported and crippled by infighting, the movement continued to atrophy, experiencing a brief revival during the Spanish Revolution and Civil War (1936–1937) when the anarcho-syndicalist Confederacion Nacional del Trabajo (CNT) collectivized industries in Catalonia and agriculture in Andalusia.

LABOR MOVEMENT 1877–1919

The history of the American working people's collective attempts to resist dependence and inequality remains largely unknown and misunderstood in popular culture, perhaps, as one historian speculated, because it does not accord well with the nation's dominant narrative of individual struggle and success. Because of state intervention and employers' use of technology and new production processes to increase labor competition, working-class movements between 1877 and 1920 were, on the whole, unsuccessful in realizing both their broader visions of a just industrial society and many of their less ambitious demands in regard to wages and working conditions for the majority of working people. Those failures had the effect of narrowing and tempering the aspirations of the dominant sector of the labor movement. Historians who favored this development interpreted what *was*—that is, the conservative approach of the country's most powerful unions—as what had always been, and the labor movement's more complex, radical past receded from popular memory.

AMERICAN WORKERS IN THE INDUSTRIAL ERA 1877–1920

The period 1877 to 1920 saw rapid, wrenching changes in American society and culture. An agrarian country in 1877, by the end of World War I the United States was an urban nation in which most adult inhabitants labored under employers and 40 percent of the workforce was involved in manufacturing. Modern cities, such as New York City, San Francisco, Philadelphia, Chicago, and Brooklyn (until it was incorporated into New York City), attracted most of the nation's industries, and their neighborhoods reflected the great divides in wealth, between the rich, the new urban middle class, and the poor, that emerged with the growth of industrial capitalism. These same developments, though on a smaller scale and at a slower rate, occurred in Southern cities, such as New Orleans, Louisiana, Birmingham, Alabama, and Chattanooga, Tennessee, where blacks and whites entered the tobacco, iron, steel, and shipping industries as waged laborers. Outside the South, city populations swelled with immigrants, over 26 million of whom arrived in the United States between 1871 and 1920. For much of the nineteenth century, immigrants typically hailed from northern and western Europe. Between 1890 and 1920, this pattern shifted. "New immigrants" from central, eastern, and southern Europe and from Mexico flooded into the nation, and, in contrast to the mainly Protestant "old immigrants," they included large numbers of Catholics, Jews, and Greek and Russian Orthodox.

The impact of these changes was tremendous. The wave of immigrants to the United States remade the American working class, which by the end of this period was more ethnically diverse than the workforces of Canada, Australia, and Great Britain. It was also racially and ethnically stratified. White, Protestant, native-born men, and the sons of northwestern European immigrants dominated skilled work, while "new immigrants" filled the ranks of the unskilled and semiskilled. African Americans, Mexican and Chinese immigrants, and, in the Northeast and Midwest, the Irish typically worked in the most irregular and poorly paid menial jobs.

Employers were tempted to play upon racial and ethnic divisions when labor competition was high, and they met with some success in doing so. This was especially the case in the South, where blacks, owing to disenfranchisement campaigns and debt peonage, lacked both political and economic power by 1900. However, an employer who experimented with black labor in the South risked a boycott by white customers or a race strike by white employees. North and South, "white" jobs were almost always cleaner, safer, and better paid than "black" ones. Few whites challenged a system that benefited them.

The rise of the factory further segmented the American workforce, as the proportion of women engaged in factory work more than quadrupled, from 4 percent in 1870 to 17 percent in 1900. In the Northeast, female industrial workers were typically foreign-born or the daughters of foreign-born parents. They worked mainly in the garment industry but also labored in canneries, box-making factories, book binderies, and commercial laundries. Women almost always held "women's jobs." As with men, racial hierarchies shaped in crucial ways the division of work among women. In Southern tobacco-processing plants, for example, white women operated the machines, while black women were relegated to the harder and dirtier job of stripping the tobacco leaves by hand. All female workers, white and black, shared an exclusion from skilled work, which was reserved for men. "Women's work" was invariably poorly paid, unskilled, and competitive. Obstacles to skilled labor positions included not only the hostility of male craft workers but also the hesitancy of employers to train women workers whom, they believed, sought only temporary employment.

Industrialization demanded a discipline and rhythm of work that was new to many workers who had arrived at the factory gates from either rural areas of America and Europe or from employment in small factories and shops in which custom rather than the clock governed the speed, quality, and nature of work. These workers carried with them into the factories notions of a flexible relationship between work and living. Thus, immigrant Jews and Slavs, for example, mystified native-born employers by missing work in order to honor religious holidays or to participate in festivals. Skilled coopers, also to the amazement of manufacturers, worked steadily Tuesday through Friday but then insisted upon their traditional long weekend. Even the job-hungry unskilled risked taking periodic breaks or attempted to set their own speed of work according to customary understandings of a "fair day's work" rather than conform to the industrialists' dictum that "Time is money."

Skilled workers were more able to resist the harsh industrial discipline sought by business owners and managers. In his book, the *Fall of the House of Labor*: *The Workplace, the State, and American Labor Activism, 1865–1925* (1987), historian David Montgomery described the control exerted by Ohio iron workers during the 1870s and 1880s as a result of their highly sought skills: "The workers . . . decided collectively, among themselves, what portion of [the] rate should go to each of them . . . how work should be allocated among them; how many rounds on the rolls should be undertaken each day. . . . To put it another way, all the boss did was to buy the equipment and raw materials and sell the finished product."

Yet, during this period, mechanization took a huge toll on many skilled workers, including brass workers, puddlers, dressmakers, coopers, and shoemakers. Men who had enjoyed some leverage at work because of their skill confronted new processes in which each worker repeated a small, separate task that required little skill or training. One unionist fumed, "The men are looked upon as nothing more than parts of the machinery that they work."

Manufacturers' introduction of machinery proved an effective tool in reducing many skilled workers to the level of the semiskilled or unskilled. Still, the tension between pre-industrial and industrial work habits remained frequent between 1877 and 1920, because, as historian Herbert Gutman pointed out in his classic study, *Work, Culture, and Society in Industrializing America: Essays in American Working-Class and Social History* (1976), "The American working class was continually altered in its composition by infusions, from within and without the nation, of peasants, farmers, skilled artisans, and casual day laborers who brought into industrial society ways of work and other habits and values not associated with industrial necessities and the industrial ethos."

Industrialization entailed other hardships for workers. Although highly skilled workers received a large share of the era's prosperity, and wages in the United States were far higher than in industrializing Europe, testimonies before investigative committees and the reports of state and federal agencies suggest that the average American worker had to struggle in order to subsist under industrialism. Immigrant families and families supported by women workers in particular fell below the minimum required earnings for a healthy, decent life. The main reason for this is that although working men and women benefited from economic booms, the busts that followed booms brought unemployment or underemployment to thousands, even millions, without regard to talent or productivity. Five serious economic depressions cut into working people's earnings and opportunities between 1877 and 1914. For most working people, poverty was an inevitable condition that they faced at some point in their lives. Government at this time did not provide any sort of safety net for the unemployed, and during economic crises the needs of the poor far outstripped the resources of private charities. The

poor were left to ride out bad times as best they could on their own.

One way in which working people supplemented family income was to send their children to work in factories, mines, and mills. By 1900, about 1.7 million children were engaged in industry. Child labor was especially common in the mines and in the silk mills of the anthracite region because miners so often lost their lives or were disabled at work, leaving their families destitute. In addition, miners' low wages necessitated that children supplement the family income.

In addition to these problems, long hours and intensive rates of work resulted in a larger number of industrial accidents in the United States relative to other industrializing nations. The mines, railroads, and steel mills were particularly dangerous. Two thousand fatalities occurred each year between 1905 and 1920 in the coal mines, and in 1901 one in eleven operating trainmen suffered injury, often the loss or mangling of a limb or limbs. Every year between 1907 and 1920, one in four immigrant workers at the Carnegie South Works was injured or killed.

Unhealthy, demoralizing working conditions also plagued workers. Immigrant women labored in the hot, noisy, steam-filled rooms of commercial laundries and breweries, and in attics and basements they were "packed like sardines in a box." In mining camps and towns, "breaker" boys, mostly ten to fourteen years old, breathed in thick clouds of coal dust as they separated debris from loads of coal. Italian immigrant track workers in the North American West made makeshift homes out of railway boxcars that provided little relief from the elements. Their company-supplied food was, in the words of one laborer, "not even fit for dogs."

The 1877 Railway Strike

Although strikes were frequent in the decade following the Civil War, labor activists during that time drew largely upon free-labor ideology to emphasize cooperation between capital and labor. This ideology originated in antebellum days, when most "workingmen" labored under an employer who was onsite and reliant upon his employees' skills in producing a product. Looking back to this era of relative autonomy, postbellum labor leaders tended to avoid the image of class conflict in their analysis of "the labor question" and sought instead to restore the independence that skill had brought antebellum industrial workers. Some hoped that projects such as worker-owned cooperatives would help laborers to amass capital and thus escape wage labor. Others agitated for legislation to limit the working day so that workers might reclaim the time usurped by manufacturers and spend it instead participating in the nation's political and social life. On the railroads, skilled trainmen stuck to a conservative course, paying dues to brotherhoods that sought to focus their energies on protecting members and their families from financial loss in case of injury or death.

The Panic of 1873 caused many labor activists to reconsider the relationship between laborers and their employers. The 1873 crisis stemmed from the overexpansion of the railroad industry, much of which speculative credit had financed. This produced a rash of defaults on bonds by railroad companies and their takeover by receivers. Railroads, in turn, attempted to minimize costs by cutting train crews to dangerously low numbers, neglecting equipment and track, and repeatedly slashing railroaders' wages. These measures increased the frustrations of railroad men, who throughout the 1870s had endured numerous exploitative work rules and conditions, including inhumanly long hours at jobs that required dexterity and alertness to ensure the safety of passengers and coworkers. Railroaders also worked "double-headers" in which they operated trains twice the usual length without the help of extra hands. Furthermore, these wage cuts came in a context in which as many as three million people were without work and more than four-fifths of those with a job were underemployed.

On July 16, 1877, railroad workers struck en masse. By July 22, nearly one million had walked off their job. Within a week, the strike had spread from Martinsburg, West Virginia, to Pittsburgh, Reading, Columbus, Chicago, Terre Haute, Kansas City, and San Francisco. In Baltimore, St. Louis, Philadelphia, and other cities and towns, discontented nonrailroaders joined strikers and in some areas destroyed railroad property and attacked militia units sent to crush the strike. According to contemporary estimates, more than 80,000 railroad workers, perhaps one-third of them Irish, and about a half million sympathetic nonrailroaders were involved in the unrest at its height. In St. Louis, a relatively peaceful general strike closed about sixty factories, while in Philadelphia, Pittsburgh, Chicago, and elsewhere riots and bloody confrontations broke out between strikers and militia.

The 1877 strike produced an important shift in the mainstream press's understanding of labor issues. Prior to the conflict, leading editorialists and commentators had mainly associated mob action with immigrant groups and Communists, not native-born, skilled workingmen. In his 1994 article "Chaining the

Soldiers of the Sixth Maryland Regiment fire on workers of the Baltimore and Ohio Railroad in July 1877. A turning point in the nation's history, the national railroad strike ushered in a long era of bloody conflict between labor and capital. *(Brown Brothers)*

Tiger: The Mob Stigma and the Working Class, 1863–1984," historian Eugene Leach argued that the strike "confounded the crucial distinction between riotous workers and law-abiding ones" that had dominated previous views of crowd action. "The riots seemed to spill across divisions of occupation, ethnicity, geography, and even gender, expressing resentments widely shared in the working class," Leach observed. It was therefore difficult for mainstream critics to explain away labor unrest and violence as the work of immigrants, agitators, and lawless elements.

The discipline that characterized the parades of thousands of strikers and their sympathizers through the streets of St. Louis and Philadelphia in 1877 caused elite and middle-class onlookers to fear the coming of a class-based revolution. Influential analysts laid responsibility for the unrest at the feet of strikers themselves. The press urged railroads to refuse to make concessions of any kind and bitterly attacked those companies that capitulated to workers' demands. As a result of the 1877 strike, then, dominant opinion solidified against independent working-class organization and against strikes in particular.

Gilded Age Labor Movements

In the years following the 1877 railway strike, various labor leaders debated the causes of labor violence. In 1883, John Swinton, the publisher of a popular working-class newspaper, warned Americans that the unbearable conditions that had precipitated labor violence in 1877 must radically improve: "Don't let us have a tiger among us that needs to be chained; let us have neither tiger nor chains; away with the Wrongs by which he is generated." In contrast to Swinton's solution to the "labor question," which entailed a radical restructuring of society, trade unionist Samuel Gompers emphasized the need for organization among skilled workers. The future leader of the American Federation of Labor (AFL) viewed workers' lack of organization as the chief cause of strike and of labor unrest in general. Without the discipline of a trade union, he argued, workers tended to act "upon ill-considered plans, hastily adopted," and "upon passion." Trade unions would act as "conservators of the public peace" and "check the more radical elements in society."

Trade unions did gain new life in the decade following the 1877 strike. Although blacklists and dismissals in the immediate aftermath of the riots almost destroyed the railroad brotherhoods, these craft associations and others, particularly the cigar makers and construction unions, steadily rebuilt their membership. By 1886, about 350,000 craft workers belonged to a national body, the Federation of Organized Trades and Labor Unions of the United States, and in Cincinnati, Boston, Chicago, Denver, New Orleans, and San Francisco, craft unions had formed powerful citywide organizations.

The labor organization that made the greatest strides during the late 1870s and early 1880s was not limited to craft workers but was instead industrial in character. Called the Knights of Labor, the organization had its start in a number of secret societies formed among Philadelphia artisans following the Civil War. Despite the hostile climate toward unions, a growing number joined the Knights after 1878, when the order rejected secrecy and began to organize openly on a national scale. Rather than limit membership to skilled white male workers, as labor unions had done in the past, the Knights admitted and actively recruited a far broader range of people: blacks and whites, native-born and immigrant, Catholic and Protestant, the skilled and unskilled, sympathetic

shopkeepers and business-owners, and beginning in 1881, women. Although it excluded the Chinese and played a leading role in anti-Chinese violence in California, Wyoming, and Oregon, by the mid-1880s the order was in other respects the first mass organization of its kind.

Led by machinist Terence Vincent Powderly, the Knights gave voice to the widespread concern that industrialists' power posed a danger to the Republic. If, as the founders contended, the liberty of citizens turned on their independence, then, the Knights reasoned, the nation's industrial path had undermined liberty by introducing machines and processes that degraded skilled labor and vastly enlarged the nation's permanent underclass of the dispossessed. In sum, industrialism had created the widespread economic dependence of working people on employers. It left workers little time or energy to exercise the rights of citizenship, and it threatened social anarchy. These developments, the Knights charged, represented the harbingers of tyranny.

Trade unionists and industrial unionists cooperated on a number of fronts. In 1885, New York City's massive citywide labor organization, the Central Labor Union, represented over 200 unions of both skilled and unskilled workers, in San Francisco skilled cigar makers found widespread support for their boycott of Chinese-made cigars among the city's white working poor, and unskilled and semiskilled Poles joined German American craft workers in Milwaukee's Knights of Labor union halls. Across the country, working-class communities proved enthusiastic supporters of the eight-hour-day campaign. In 1886, the year that labor historians term "The Great Upheaval," about 400,000 workers struck in support of this demand, with the Knights often in the lead.

On the western railways, the industrial credo of the Knights brought impressive gains. As railroad companies slashed wages and implemented other cost-saving measures in order to remain competitive, the railroad brotherhoods, which since the debacle of 1877 had eschewed labor conflict and emphasized the shared interests of capital and labor, came under increasing pressure from members to combine with shop workers, brakemen, switchmen, and track laborers in an effort to gain a more powerful voice for labor on the railroads. Engineers and firemen respected shop worker-led strikes on the Union Pacific in 1884 and on Jay Gould's sprawling Southwest system of roads in 1885, both of which won promises from management to rescind wage cuts. These victories, along with a much-celebrated agreement negotiated between Terence Powderly and Jay Gould in September 1885, swelled the Knights' membership rolls to between 700,000 and one million.

The Knights' language of antimonopoly appealed to residents of towns and cities across the United States that in many ways remained "island communities" during the nineteenth century. In *The Search for Order, 1877–1920* (1967) historian Robert H. Wiebe wrote, "The heart of American democracy was local autonomy. . . . American institutions were still oriented toward a community life where family and church, education and press, professions and government, all largely found their meaning by the way they fit one with another inside a town or a detached portion of a city." Local citizens saw their communities thrown into chaos by economic forces that were national in scope and often indifferent or hostile to their interests as well as the interests of their working-class neighbors.

The relationship between local communities and railroads is a case in point. Striking railroaders in the Southwest found widespread sympathy for their plight among farmers and small merchants who resented the discriminatory rates charged by railroad companies. City officials angered by the Missouri Pacific's negligence in paying local taxes also identified with strikers. In *A Generation of Boomers*: *The Pattern of Railroad Labor Conflict in Nineteenth-Century America* (1987), Shelton Stromquist pointed out that local support for railroad labor struggles was not by any means universal. In market cities such as Burlington, Illinois, the reduced railroad rates that manufacturers enjoyed often led them to side with railroads, and "social solidarity" among large and diverse working-class populations was "more fragile and fragmented." Still, in numerous smaller railroad towns, where railroaders' economic well-being was tied to that of retailers and where dependence on railroads "bred a fierce independence," citizens of varied backgrounds and means cast the railroaders' fight against impoverishing wage cuts as a struggle for local rights and concerns against the impositions of an alien power.

By the turn of the century, however, the industrial unionists such as the Knights numbered in the thousands rather than the hundreds of thousands. Many labor activists had rejected or put aside the order's radical republican vision. In the Knights' place stood the AFL. In contrast to the Knights, its leadership accepted industrial capitalism and aimed to secure gains in wages and working conditions for its members, craft workers, in return for labor peace. Rather than seek government's help in restoring the

SAMUEL GOMPERS (1850–1924)

Born to Jewish working-class parents in London on January 27, 1850, Gompers migrated to the United States with his parents in 1863 and became a naturalized citizen in 1872. He followed his father into the trade of cigar making and in 1864 joined the local union, serving as its president from 1874 to 1881. Influenced by British trade union principles and by the Marxist emphasis on the primacy of the economic organization of workers, Gompers worked to create strong, centralized trade union institutions that would help grow and direct local unions. He and Adolph Strasser founded the Federation of Organized Trades and Labor Unions in 1881 along these principles, as well as its successor as the American Federation of Labor (AFL) in 1886. Gompers was the AFL's first president and remained president, except for the year 1895, until his death.

Like many Marxists, Gompers believed that trade unions would develop awareness of a broad class interest among workers, and that political activity and reform did little for the workers unless organized workers in the factories and craft shops enforced change. Yet, despite his Marxist beliefs, as a labor leader, Gompers gained a reputation for conservatism. Even in the lowest paying jobs, the influx of immigrants to the American workforce was deeply resented because their presence kept wages low. Gompers, a self-described champion of the working man, shared this resentment. He directed the successful battle with the all-inclusive Knights of Labor for supremacy over organized labor. But even after the downfall of the Knights of Labor by the end of the 1800s, by 1904, the AFL accounted for around 10 percent of all nonagricultural workers. Its emphasis on recruiting skilled craft workers excluded the less skilled at a time when these workers were growing in numbers and contributed to the drop in membership over the next decade. Gompers distrusted the influence of intellectual reformers, fearing any activity that would divert labor's energy from economic goals. To that end, he kept the union out of politics in the early days and refused cooperative business plans, socialistic ideas, and radical programs, maintaining that more wages, shorter hours, and greater freedom were the just aims of labor. To differentiate the AFL from more radical elements in the labor movement and to make the organization appear more respectable, he encouraged binding, written trade agreements.

Gompers came to be recognized as the leading spokesman for the labor movement, and his pronouncements carried much weight. As government regulation of industrial relations increased, Gompers led the AFL into political alliances and even actively supported Woodrow Wilson's presidential candidacy in 1912. During Wilson's two terms, Gompers helped push the Clayton Anti-Trust Act of 1914 and the Seamen's Act of 1915 through Congress. With the outbreak of World War I, Gompers organized and headed the War Committee on Labor. As a member of the Advisory Commission to the Council of National Defense, he helped to hold organized labor loyal to the government program. As a result, during the war, union membership more than doubled to nearly 4 million from its earlier peak of 1.7 million members in 1904. After the war, however, several failed strikes left the union weakened. It slumped further in the pro-business atmosphere of the 1920s. Gompers died in San Antonio, Texas on December 13, 1924. His autobiography, *Seventy Years of Life and Labor* (1925), was published after his death.

James G. Lewis

Republic to industrial America, the AFL embraced "volunteerism"—an antistatist outlook that opposed the extension of government's role in industrial relations, specifically, the hostile intervention of the courts in labor conflicts.

A number of factors led to the Knights' demise. First, Knights on the Southwest system lost an 1886 strike that involved almost 9,000 workers. Many participants had to move elsewhere in search of work; others landed in jail for allegedly violating court injunctions against interference with railroad property or for assault or intimidation of strikebreakers. At about the same time, on May 4, 1886, a bomb killed a policeman at Haymarket Square in Chicago, where Socialists and Anarchists led a meeting of about 300 workers to protest the deaths of two unarmed workers involved in a strike at the McCormick Reaper Works. An antiradical, anti-immigrant hysteria followed in which the meetings' Anarchist leaders were convicted and hanged for their politics rather than any involvement in the bombing. Although Powderly distanced the order from the accused, the Knights' fortunes suffered in the wake of the Haymarket Affair. The frenzy encouraged employers to vigorously fight and defeat a number of major Knights of Labor strikes in 1886, and further widened the divide that had

MARY HARRIS "MOTHER JONES" JONES (1830–1930)

Born in Cork, Ireland, on May 1, 1830, Mary Harris was brought to America some time after 1835 by her father, who had preceded the rest of the family in emigrating. In 1867, Jones lost her husband and four children to yellow fever, and then all of her personal belongings in the great Chicago fire four years later. Attracted by the Knights of Labor campaign for improved working conditions, she turned to them for assistance, and became involved in the American labor movement. She won fame as an effective speaker and by 1880 was a prominent figure in the movement.

An active proponent of legislation to prohibit child labor, Jones also organized miners, garment workers, and streetcar workers. One of the founders of the Social Democratic Party (1898) and the Industrial Workers of the World (1905), she was a lecturer for the Socialist Party of America. She traveled across the country, both organizing for the United Mine Workers and speaking on her own, supporting strikes, and galvanizing public support for labor with her slogan, "Join the union, boys."

In 1913, her organizing activities were blamed for violence in the West Virginia coal mines, and she was convicted of conspiracy to commit murder. Her ordeal ended when the governor released her. The U.S. Senate ordered a committee to investigate conditions in the West Virginia coalfields. In 1914, her graphic description of the massacre of twenty people by machine-gun fire during a Ludlow, Colorado, miners' strike convinced President Woodrow Wilson to try to mediate the dispute. A long-time champion of laws to end child labor, she continued as a union organizer and agitator into her nineties. She wrote *Autobiography of Mother Jones* in 1925, which contains some factual inaccuracies. She died in Silver Spring, Maryland, on November 30, 1930, and is buried in the Union Miners Cemetery at Mount Olive, Illinois.

James G. Lewis

emerged between trade unionists and industrial unionists, as trade unionists sought to disassociate their organizations from radicalism.

Differences in philosophy and strategy between trade unionists and industrial unionists rose to the surface in the mid-1880s. In order to protect the favorable contract gained in the 1885 strike, most engineers and firemen obeyed their brotherhoods' order to continue work during the 1886 Southwest railway strike, vastly complicating Gould system Knights' efforts to win company recognition of employees' executive committee. In May 1886, Samuel Gompers, then head of the Cigar Makers International Union, called a meeting of national unions to discuss the relationship of trade unionists and the Knights after Socialist cigar makers, supported by the Knights, threatened his conservative leadership. The meeting rejected the tradition of dual unionism, which had allowed skilled workers to belong both to their craft unions and the Knights, and formed the AFL. The efforts of Gompers and other AFL leaders to avert a general strike in Chicago in support of the 1894 Pullman boycott illustrates the union's continued commitment to an independent, more conservative path.

Nonetheless, although the AFL's approach differed considerably from that of the Knights, the line between trade unionists and reformers was a porous one in the Gilded Age. Historian William Forbath, in his book *Law and the Shaping of the American Labor Movement* (1991), contended that the typical AFL activist "shared the Knights' radical ambitions and their faith in lawmaking and the ballot as ways of ending the 'tyranny of capital.' " AFL leaders joined the Knights in lobbying state governments and Washington on behalf of legislation that mandated an eight-hour day and a ban on tenement manufacturing and payment in scrip, and members of the AFL and Knights alike exhibited strong support for independent and third-party candidates. These political efforts faced huge obstacles, including ethnic and racial divisions, single-member constituencies, the cost of running candidates at the federal level, and party loyalties shaped by the Civil War and Reconstruction. Despite such serious impediments, during the 1870s and 1880s many labor activists tried and some succeeded in winning office on the state and local level. Labor-supported candidate Henry George lost the New York mayoral race but succeeded in polling one-third of votes cast, and labor parties won in municipal races across the nation.

Forbath argued that it was only after labor activists suffered a series of defeats in the courts during the 1880s and 1890s that "trade unionists' views of what was possible and desirable in politics and industry" changed, from an emphasis on "broad, positive reforms" to a focus on winning "bread and butter" gains for its members through collective bargaining. Judicial hostility to the boycott, the sympathy

strike, reformist legislation, and even the right to strike itself "shaped labor's strategic calculus" so that by the turn of the century radicals in the AFL were a distinct minority.

Although strikes remained legal throughout the nineteenth century, boycotts and sympathy strikes came increasingly under judicial attack. These attacks began in response to railway labor disputes, as judges tended to see railway strikes, especially nationwide actions, as a threat to the public interest, and unionists' attempts to control shop-floor rules as a threat to the rule of property and contract. The courts laid the basis for state intervention when they ordered federal troops to intervene in the 1877 strike in order to restore commerce and social order when state and local officials sympathetic to the railroaders refused to deputize volunteers or call in state militia. In 1886, injunctions issued against those engaged in work stoppages on roads under receivership (bankrupt roads under public management) doomed the Knights' strike on the Southwest system. The courts expanded the scope of the labor injunction to workers who boycotted handling of struck company cars in the 1888 Burlington strike, even though the railroad brotherhoods had long used the secondary strike to win collective bargaining agreements for its members. By the time the industrial American Railway Union (ARU) waged a strike in 1894 to restore the wages of employees of the Pullman Palace Car Company, the legal groundwork for the injunctions that ultimately doomed the Pullman strike were in place. Federal and state troops enforced a court decree against the ARU boycott of Pullman cars, crushing a strike that had involved at its height almost 260,000 railroad workers from Chicago to the Pacific.

The federal courts were reluctant to intervene in nonrailroad labor disputes for much of the nineteenth century, but the rise of the citywide boycott, which enlisted the sympathy of broad segments of working-class populations with boycotts of "unfair" goods and shops, changed this. Beginning in the late 1880s, courts redefined property to include the ownership not only of objects but also anything that had "exchangeable value." The redefinition later allowed courts to cast the boycott as a "combination" under the Sherman Anti-Trust Act and the picket line as intimidation and thus a violation of workers' property right to pursue their vocations. Judicial hostility to strikes for work-rule changes and closed shops pushed state and local authorities to intervene on their own. In 1892, the governor of Pennsylvania dealt the strike against Andrew Carnegie's Homestead steel works a severe blow when he ordered the state militia to restore law and order after strikers drove back company-hired and armed Pinkerton agents brought in to protect strikebreakers. The loss decimated the unions of skilled iron and steelworkers.

The indefatigable Mary Harris "Mother" Jones traveled widely to organize workers, mobilize strikers, and fight for better labor conditions. She remained active well into her nineties. *(Brown Brothers)*

Gilded Age labor activists, including AFL leaders, sought redress in the political arena with little success. Federal judges were mostly from the ranks of elite Republicans unsympathetic to labor, and professional associations governed the process of selecting candidates for state judgeships, diminishing labor's influence from the outset. The courts determined the fate of reformist legislation, usually in the employers' favor. In 1885, a federal court overturned an AFL-supported New York statute outlawing the manufacture of cigars in tenements on the grounds that sweatshop workers were free laborers entitled to

make their own decisions about employment. On similar grounds, the Illinois Supreme Court struck down a hard-fought Illinois law restricting the hours worked by women and children. When AFL members debated whether to pursue state involvement in labor disputes in the 1890s, "volunteerists" cited invalidated labor laws as evidence that the federation should reject state intervention in favor of the economic power of craft unions.

Although the Knights' numbers had diminished significantly by the 1890s, the order's producer ideology remained a potent force among a number of industrial workers, as the extensive support among railroad workers for the Pullman boycott illustrates. The United Mine Workers of America preserved the Knights' inclusive organizing strategy, organizing white and black, skilled and unskilled alike. The alliance formed between industrial workers, farmers, and sharecroppers in the mid-1890s in support of Populist Party candidates revived for a brief time working-class support for independent parties. Many of the Southern black tenants, miners, day laborers, and domestic workers who had joined the Knights in the late 1880s and early 1890s likely lent their support to the Colored Farmers' Alliance and to Populist candidates in 1894 and 1896, as a sizable number of industrial workers did in their search for relief from the economic depression that began in 1893.

The Populist coalition collapsed, however, owing in part to regional differences but mostly to key material conflicts between agricultural and industrial populations. Farmers wanted cheap money, inflation, an end to the protective tariff, and free silver, while industrial workers favored cheap food, hard money, high wages, and protection from foreign competition. The Republican victory in the 1896 presidential election was largely a result of these divisions. The producer ideology that had moved thousands to cross lines of race, skill, gender, ethnicity, and religion to challenge industrialists' values in the 1880s had by the end of the century entered a period of decline from which it never fully recovered. In its wake, the exclusive, antistatist strategy of the AFL dominated. Although the broader vision of an industrial Republic remained unfulfilled in 1900, over the succeeding two decades middle-class Progressives and their working-class allies drew upon elements of this vision to launch a series of reforms that reshaped and reinvigorated American labor movements.

Progressivism and Labor

Following five years of depression, the American economy expanded after 1897, and with it the AFL grew. Shortages of skilled workers in numerous industries, including railroading, construction, and coal mining, inspired union-organizing drives that brought AFL membership to 1.7 million by 1904. The AFL's growth was in large part due to the success of its strategy of "business unionism," which won for many AFL members improved wages and working conditions. "Business unionism" refers to the approach best summed up by Gompers, who viewed unions as "business organizations of wage-earners." Accordingly, the AFL made material objectives its central concern and pursued these objectives by resorting to the strike as an economic weapon only after a careful calculation of risk, securing labor contracts that codified rules and procedures negotiated by a professional class of labor bureaucrats, and, in order to reduce labor competition, seeking immigration restrictions and resisting the inclusion of immigrants, women, and nonwhites. There were costs associated with this strategy. Bureaucracy, and the alliance of some member unions with corrupt urban political machines, eroded the organization's democratic traditions and its idealism. Still, AFL unions, especially the United Mine Workers and the International Typographical Union, railroad brotherhoods, and building trades, won significant victories during this period.

The vast majority of working people stood outside of trade unions and thus received few of the rewards brought by "business unionism." The AFL leadership and many of its members saw black labor as a threat to white labor; the organization issued only about 82,000, or 3 percent, of its union cards to black workers, and most of its member unions excluded blacks entirely. In these policies, the AFL mirrored larger developments in American race relations: Northern acquiescence to the solidification of segregation in the South, the dramatic increase in lynching, and, in the wake of the Populists' defeat, the passage of numerous laws that effectively disenfranchised Southern black men.

In spite of these obstacles, some African Americans found a place in the AFL. In Alabama, for example, black industrial workers joined all-black and integrated unions and occupied leadership positions in the state federation. In Birmingham-area mines, blacks comprised 60 percent of the miners' biracial union by 1915. Biracial unions did not necessarily pro-

vide a haven of racial equality and brotherhood. The Knights of Labor's biracial approach, after all, had involved the acceptance of segregated locals in the South and a racial hierarchy in employment, the relegation of blacks to secondary leadership positions, and white paternalism toward black members. The same traditions of white supremacy shaped relationships between Alabama's black and white miners. Nonetheless, their commitment to an integrated, industrial union represented a sharp departure from the approach taken to race relations by other social organizations in the South and the nation's most powerful labor organization.

Women did not find a place in the AFL, mostly because employers banned their entrance into the skilled trades but also because of the AFL's view of female industrial workers as intruders in the labor market and, more to the point, as saboteurs of male privilege. The proper role of the father and the husband was, in most AFL members' eyes, the family breadwinner, while women and children were properly the dependents of men. The AFL therefore sought special protections for women in industry and a family wage, by which the AFL meant higher male wages, in order to render female paid labor unnecessary and restore male power in the household. In viewing female workers as unnatural, the AFL did not differ much from most Knights of Labor, but Gilded Age labor activists, male and female, tended to support the family wage as a means to benefit the whole family.

By 1920, women were working for wages in record numbers. In 1910, virtually all of the two million Americans engaged in domestic service were women, many of them Irish-born or African American, and women dominated unskilled and semiskilled work in the garment industry. Some worked to supplement a male family member's wages, others to support their own household, and still others to gain some independence and security for themselves. Although most female workers stood outside of organized labor, like male workers they sought, in various ways, to exert control over their working conditions. In New York City, for example, native-born women joined working girls' clubs that offered opportunities for recreation but also a forum for expressing workplace grievances, sympathy for labor organizations, and a desire for cooperation. Black domestic workers in the South challenged employers who demanded long hours and low wages by quitting and seeking employment elsewhere and sharing information about employers with other domestics in mutual aid societies and neighborhood associations.

The growth of the AFL at first drew a cautious but accommodative response from a number of major industrialists who joined the National Civic Federation (NCF), an organization which, in the hope of promoting labor peace, endorsed employer cooperation with conservative unionists. However, many small business owners, who could less afford the welfare capitalism proposed by industrialists of the NCF, waged a full frontal assault upon the closed shop. Appealing to the ideals of individualism and liberty, and meeting with much success, organizations such as the National Association of Manufacturers defended employees' right to refuse to join unions, disseminated anti-union pamphlets, and used private armed guards, strikebreakers, and the blacklist to defeat workers who struck in protest. Moreover, employers turned to mechanization and scientific management techniques that reduced the power and prestige of skilled workers in numerous industries.

At the same time that AFL unions went on the defensive, garment workers unions underwent a period of explosive growth. About 400,000 mostly unskilled and semiskilled Italian and east European immigrant women joined unions in the space of four years (1909–1913). Their success was probably partly due to the highly competitive and unstable nature of the industry, which encouraged large employers to see unionization as one way to rationalize their trade. Progressive reformers also proved helpful, as their support for industrial harmony through arbitration played a role in convincing employers to negotiate with the garment workers when they struck the industry. But the main impetus for reform came from below, in 1909 and 1910—first among shirtwaist workers, whose general strike drew 20,000 participants, and then among 100,000 male and female clothing industry workers.

The upheaval in the garment industry coincided with, and was in part influenced by, the rise of the Socialist Party and the International Workers of the World (IWW). Led by Eugene V. Debs, who had embraced socialism while serving jail time for his role in leading the Pullman strike as president of the ARU, the Socialist Party found supporters among many unskilled workers, such as those in the garment, textile, and shoe industries, some skilled workers and middle-class women, farmers threatened by tenancy in the Southwest, and "new" immigrants. At the national level, the party garnered a substantial number of votes in 1904 and 1908, and numerous Socialists won elections at the state and city level. In contrast to the Socialist Party cohorts, who were by and large

After destroying a strikers' tent camp in Ludlow, Colorado, on the night of Easter Sunday in 1914, members of the Colorado National Guard pose with their rifles. Soldiers killed fourteen people—including eleven children—making the "Ludlow Massacre" one of the bloodiest state-sanctioned attacks on workers during the Progressive Era. *(Denver Public Library)*

gradualists willing to pursue an electoral strategy, IWW members, or "Wobblies," renounced politics and sought the immediate emancipation of workers through spontaneous, direct action. An estimated two to three million Americans were "Wobblies" between 1909 and 1919.

Although no stable union emerged from the Wobblies' efforts, and the Socialist Party's electoral strength was eventually sapped by the Democratic Party's concessions to labor under President Wilson, both were important because they offered organization to unskilled workers, particularly immigrants, when the AFL did not. IWW influence can be seen especially in the textile strikes in Lawrence, Massachusetts, in 1912 and in Paterson, New Jersey, the following year. These strikes involved mostly immigrant men, women, and children, working people spurned by the AFL.

In Paterson, strikers met defeat after English-speaking skilled workers, who had joined with Italian and Jewish workers, returned to work. Garment workers did not obtain recognition for their union, the International Ladies' Garment Workers' Union, and the spread of industrial unrest to other immigrant laborers faltered after Paterson. But in Lawrence, where police attacks on women and children raised public ire against mill owners, and in the garment industry, strikers were able to wring concessions from owners, including reduced hours, pay raises, improved conditions, and overtime pay. Moreover, their well-publicized struggles, along with the violent repression of miners at Ludlow, Colorado, in 1914, convinced a significant segment of the middle class that only progressive, rational reform efforts could reestablish order and democracy in industrial America.

Middle-class and working-class Progressive-Era reformers pushed for and won a slew of labor legislation aimed at correcting industrialism's ills. As president, Theodore Roosevelt brought the federal government for the first time into an industrial dispute on the side of labor when he pressured mine operators to negotiate a strike by United Mine Workers in Pennsylvania in 1902. The AFL, female unionists, and social feminists allied to win protective legislation for women workers, measures that the Supreme Court upheld in principle in 1908. Encouraged,

"Breaker boys" as young as nine years old worked up to fourteen hours a day separating coal from waste products. More than 300,000 children worked in the nation's mines, factories, and mills in the early 1900s. *(Brown Brothers)*

thirty-eight states put child labor laws on the books in 1912, and twenty-eight states limited women's hours of labor. States also passed workers' compensation laws and codes regarding safety and sanitation. To reward the AFL for its support of his election in 1912, Woodrow Wilson appointed labor leaders to federal office, established the Department of Labor, and helped to push through Congress the Clayton Act, which laid out a "bill of rights" for labor unions and sought to end the courts' use of the Sherman Anti-Trust Act against labor "combinations." The Adamson Act and the Seamen's Act, respectively, limited railroad workers' hours and mitigated the abusive authority of ship captains over sailors.

Progressive reforms signaled a dramatic transformation in many Americans' ideas about the relationship between people and the government. The acceptance of government intervention on behalf of workers to protect them from the excesses of industrialism was widespread, whereas in the 1870s middle-class and elite thinkers routinely denounced as Communism the idea that a worker should, for in-

NO REST FOR THE WEARY: CHILDREN IN THE COAL MINES
BY JOHN SPARGO

John Spargo, labor advocate and organizer, was a leading critic of the early twentieth-century labor system that relied on child labor working under dangerous conditions. In this excerpt from his book, Spargo exposes the dangerous conditions in the American coal mining industry that depended so much on children for its labor needs.

Work in the coal breakers is exceedingly hard and dangerous. Crouched over the chutes, the boys sit hour after hour, picking out the pieces of slate and other refuse from the coal as it rushes past to the washers. From the cramped position they have to assume, most of them become more or less deformed and bent-backed like old men. When a boy has been working for some time and begins to get round-shouldered, his fellows say that "He's got his boy to carry round wherever he goes."

The coal is hard, and accidents to the hands, such as cut, broken, or crushed fingers, are common among the boys. Sometimes there is a worse accident: a terrified shriek is heard, and a boy is mangled and torn in the machinery, or disappears in the chute to be picked out later smothered and dead. Clouds of dust fill the breakers and are inhaled by the boys, laying the foundations for asthma and miners' consumption.

I once stood in a breaker for half an hour and tried to do the work a twelve-year-old boy was doing day after day, for ten hours at a stretch, for sixty cents a day. The gloom of the breaker appalled me. Outside the sun shone brightly, the air was pellucid [clear], and the birds sang in chorus with the trees and the rivers. Within the breaker there was blackness, clouds of deadly dust enfolded everything, the harsh, grinding roar of the machinery and the ceaseless rushing of coal through the chutes filled the ears. I tried to pick out the pieces of slate from the hurrying stream of coal, often missing them; my hands were bruised and cut in a few minutes; I was covered from head to foot with coal dust, and for many hours afterwards I was expectorating some of the small particles of anthracite I had swallowed.

I could not do that work and live, but there were boys of ten and twelve years of age doing it for fifty and sixty cents a day. Some of them had never been inside of a school; few of them could read a child's primer. True, some of them attended the night schools, but after working ten hours in the breaker the educational results from attending school were practically nil.

. . . From the breakers the boys graduate to the mine depths, where they become door tenders, switch boys, or mule drivers. Here, far below the surface, work is still more dangerous. At fourteen or fifteen the boys assume the same risks as the men, and are surrounded by the same perils. Nor is it in Pennsylvania only that these conditions exist. In the bituminous mines of West Virginia, boys of nine or ten are frequently employed. I met one little fellow ten years old in Mt. Carbon, W. Va., last year, who was employed as a "trap boy." Think of what it means to be a trap boy at ten years of age. It means to sit alone in a dark mine passage hour after hour, with no human soul near; to see no living creature except the mules as they pass with their loads, or a rat or two seeking to share one's meal; to stand in water or mud that covers the ankles, chilled to the marrow by the cold draughts that rush in when you open the trap door for the mules to pass through; to work for fourteen hours—waiting—opening and shutting a door—then waiting again for sixty cents; to reach the surface when all is wrapped in the mantle of night, and to fall to the earth exhausted and have to be carried away to the nearest "shack" to be revived before it is possible to walk to the farther shack called "home."

Boys twelve years of age may be *legally* employed in the mines of West Virginia, by day or by night, and for as many hours as the employers care to make them toil or their bodies will stand the strain. Where the disregard of child life is such that this may be done openly and with legal sanction, it is easy to believe what miners have again and again told me—that there are hundreds of little boys of nine and ten years of age employed in the coal mines of this state.

stance, have the right to be paid a living wage. Later, in the 1930s, working Americans built upon that transformation to promote both labor peace and labor justice.

This accomplishment was a long-term one. In the short term, the results were much more mixed. Progressive reforms, the end products of compromise between groups with very different interests and belief

systems, tended to favor skilled workers and those engaged in factory work in which inspectors were an effective presence. These reforms did not touch the working lives of many other workers—unskilled laborers, domestic servants, and the rural poor. Key pieces of legislation, namely, the Clayton Act and the 1916 federal law banning child labor, were rendered meaningless by the courts, which narrowly interpreted the Clayton Act and rejected the 1916 law as unconstitutional. Indeed, the Progressive impulse to provide labor with a voice in industry did not find much appeal among judges. The courts either struck down or read out of existence virtually all of the fifty anti-injunction laws won by labor between 1900 and 1920.

World War I and Beyond 1914–1919

Labor activists confronted a new set of circumstances in the years before the United States entered World War I. Employers faced labor shortages because the war in Europe stemmed the tide of immigrants arriving on American shores. At the same time, American industry and agriculture strained to fulfill the Allied Powers' demands for food, raw materials, and manufactured goods. Working people used their power in the tightened labor market to secure improved wages and working conditions. Strikes that annually involved more than a million workers, representing a wide spectrum of employees, rocked U.S. industry between 1916 and 1920. Increased pay was a particularly important issue for most, since wartime inflation doubled consumer prices by 1920, eroding much of the gains that workers had made in wages. As the demand for goods expanded, employers attempted to increase production by introducing scientific management techniques and pushing employees to speed up their work.

Six months after the United States officially joined the Allied Powers' war effort, a colossal series of strikes in shipbuilding, coal mining, and metal industries led the federal government to institute labor commissions to adjudicate labor disputes during the war. Although some labor agency officials believed that unionization would calm labor relations, and certainly the AFL's pro-war stance helped to persuade them of this position, rather than union rights the government more consistently supported shop councils elected by employees to deal with worker grievances. When employers proved intractable, Washington pressured them to concede to their workers' demands, inducing millions to join the ranks of organized labor, which grew to five million by 1920.

The wartime demand for labor also brought hundreds of thousands of Southern rural working people into Northern and Midwestern cities—about a half million white Southerners and an equal number of black Southerners, and, into the Southwest, 185,000 Mexicans. For black migrants, the war represented a turning point. Previously barred from most skilled jobs, blacks eagerly left the Jim Crow order of the South (and the boll weevil and floods that decimated cotton crops in 1916) for the North's higher wages, voting booths, integrated busses, and superior schools. The jobs offered blacks were largely those that white people did not want, and racial tensions often simmered below the surface as blacks and whites competed for work and housing. Such tensions turned to violent conflict in East St. Louis in 1917, where white mobs murdered forty blacks in a bloody riot. Despite these obstacles and terrors, the relative freedom enjoyed by African-American migrants to the North encouraged many to commit to a fight for equal rights.

Women, too, experienced a new sense of self-purpose during the war, as industry recruited them to fill the places of men fighting in Europe and to keep up with the demand for goods. Women worked as streetcar conductors, as metalworkers and munitions workers, and an increasing number as clerical workers, among other jobs. The entrance of women into nontraditional occupations, and the hostility they often encountered from male coworkers and unionists, led many women to support women's suffrage. Without the vote, these women argued, how could they hope to change or ameliorate their working and living conditions? Women's suffrage gained force in the states and, after a hard-fought battle, became law under the Nineteenth Amendment to the Constitution in 1920.

The wartime gains in industry made by women, African Americans, and labor were quickly reversed when soldiers returned home in 1919. The prewar economy in which blacks were fired to make room for whites—both foreign and native born—was back. Women left nontraditional jobs or were driven out. Labor leaders had possessed no small amount of faith in the unions' ability to maintain and even expand their membership base and the apparatus set up during the war to resolve labor disputes, but business leaders had viewed labor's wartime role as purely temporary. Unionists responded to attempted rollbacks with large-scale protests in 1919: a general strike in Seattle, strikes of 50,000 male clothing workers in New York, 120,000 textile workers in New England

and New Jersey, 400,000 soft coal miners, and 300,000 steelworkers. White workers also expressed their anxieties over labor competition and race in the riots that swept the nation during the summer of 1919. In Washington, D.C., Chicago, Omaha, rural Arkansas, and other towns and cities, white mobs attacked black neighborhoods, but in contrast to past riots, blacks in Chicago fought back.

In combating strikes, employers built upon the antiradical politics that had developed during the war. Steel companies painted its mainly immigrant striking workforce as revolutionary, exploiting divisions between foreign-born and native-born. Fearful of the spread of radicalism in Germany, Russia, and Hungary, state militias, city police, and the federal courts backed business leaders' equation of radicalism with labor activism. The "Red Scare" primarily targeted the foreign-born, Communists, and Anarchists, but it also shaped the public's view of labor and legitimated federal or state intervention in strikes. The confidence and optimism of wartime labor quickly turned to disillusionment. Not until the 1930s would American labor movements experience rebirth and renewal.

Conclusion

John R. Commons was a Progressive-Era historian and reformer whose multivolume *History of Labour in the United States* (1946) contested the reigning assumption of Gilded Age economists that labor's collective action jeopardized the free market and thus liberty itself. Commons saw trade unions as central to the cause of industrial peace and democracy. He viewed the AFL's narrow, exclusive strategy and focus on economic gains as not only practical but desirable, as a reflection of Americans' acceptance of the basic values of industrial capitalism.

In his historical work, Commons took an institutional approach that limited the study of labor history to trade unions and collective bargaining. Since the 1960s, however, historians have uncovered a far richer story involving a clash between the values of industrialism and those of large segments of the working population. During the Gilded Age, this clash spawned labor movements that shared a republican vision of industrial relations. The differences in their approaches to this vision became more pronounced and significant in the 1880s and 1890s as the courts and employers gradually imposed an expanded definition of property that effectively outlawed many of the weapons that were key to a broad-based, reformist labor movement, namely, strikes and mutual aid aimed at changing the terms and nature of work. On this constricted ground, the Knights declined, and the AFL abandoned radicalism and moved to an exclusive, accommodative strategy for winning a respected place within the capitalist order.

The AFL met with considerable success in improving material standards for many of its members during the Progressive and World War I eras. The majority of working Americans did not enjoy these gains, however, and the inclusive, radical visions of Gilded Age labor movements found new life. Among craft workers confronting mechanization and open shop campaigns, and among immigrant workers in the garment industry especially, deteriorating conditions pushed many to engage in massive strikes that fundamentally altered government's role in industrial disputes but did little to effect immediate and tangible change in the working lives of most Americans. The courts undermined much of the labor legislation passed during the Gilded Age and the much-celebrated Age of Reform, the Progressive Era. Although labor experienced resurgence during World War I, its achievements were largely temporary. Antiradicalism, labor competition, and racial warfare left U.S, labor movements in disarray after the war. Although women and African Americans exhibited new resolve concerning civil and political rights after the war, the hope of many working-class Americans, whatever their skill, background, or philosophy, that they might gain a voice in the workplace would not again be revived until the 1930s.

Eight-Hour Day Movement

The American labor movement has fought a long struggle to establish eight hours as a standard workday. As industrialization overtook the nation and skilled crafts became unskilled due to the increased use of machinery, the amount of time workers spent on the job went as high as fourteen hours a day for little pay. The fight to establish eight hours as the standard workday would go through legislatures, courts, the streets, and cost much in time and lives.

With the growth of industrialism in America also came a dramatic change of life. From what was once an economic system based on agriculture was rapidly overcome by early machinery and its forms of power sources. From textiles to shoemaking and beyond, the ability to produce more goods at a faster and cheaper cost spread rapidly. Those who once were skilled in cherished valued crafts, like shoemaking and carpentry, rapidly saw their art reduced to simply pulling a lever or cutting a predetermined pattern. Although competition within the marketplace was always present, increased industrialization meant producing even more goods at an accelerated pace. With competition between producers growing even fiercer, new ways would have to be found to minimize cost and maximize profit. The first place to cut expenses was the workforce. Having employees work longer hours at even lower pay rates would help achieve the goal of producing more goods faster and cheaper.

The comparable growth in international trade especially influenced this increased competition. As Western countries began to open up markets, whether by negotiation or force, in places such as Asia and Africa, a scramble to establish economic superiority emerged and expanded. Furthermore, these areas also provided a rich supply of natural resources that was needed by these growing industries.

Long before industrialism took the country completely by storm, there was concern over how hard to work employees. Even the earliest American guilds and unions argued for shorter working hours, first pressing for ten hours as the standard day. But the increased use of machines, the opening of international trade routes, and finding new ways to exploit natural resources would take precedence over the number of hours someone would have to stand behind a machine.

With the Civil War came a need for increased production. When the war ended, and industry resumed on a peacetime basis, the labor movement, in comparison to industrialism, also grew at an accelerated rate. Workers began to organize more into trade unions, and one of their chief concerns was the number of hours in which employees were required to work. Hours expanded while wages shrank. Increased European immigration did not help at all, for while American workers might refuse a job with low wages and long hours, those from foreign countries, looking for a better life, had nothing to lose. Regardless of workers' feelings, employers set the number of hours, and workers either agreed or did not have a job.

In 1866, the move to establish the eight-hour day gained momentum. This movement stretched across racial, ethnic, and even gender lines. The National Labor Union was organized in Baltimore in 1866. At the forefront was Ira Steward, a machinist from Boston. Steward saw the eight-hour day movement as not just a labor but an economic concern. To Steward, working people at incredibly long hours and paying them low wages were harmful practices for both worker and employer. If people worked a shorter day for better pay, they would have time on their hands and more money in their pockets. Thus, people could purchase and enjoy more, and industry would have a steady market. Although some did not share Steward's idea of consumption, by this time the use of machines was irrefutable, even by those whose crafts were threatened, if not overtaken, by industrialism.

Several states made attempts to establish eight

hours as the legal workday. Illinois, Wisconsin, Missouri, and New York were the forerunners by passing eight-hour laws in 1886. Passing such legislation always met with fierce opposition from employers who wished to maintain a ten-hour day, with no additional pay for overtime. To many employers, the current economic situation reflected the abilities of those who could rise above. Monetary success was proof that one was capable in rising above the crowd. If one did not wish to work the shift, there would be plenty of others right behind willing to take the job.

Those states that did pass eight-hour laws found problems in enforcement. For example, Illinois law did not provide penalties for noncompliance, a point at which employers took note. Despite strikes and demonstrations, no help in enforcement came forth, only animosity toward the movement. Relief did seem to come in 1868 when Congress created an eight-hour day for laborers and mechanics working for the federal government, but this law would not have much influence on the state level.

In 1884, the movement for an eight-hour day truly took flight, although the initial declaration originally went unnoticed. The Federation of Organized Trade and Labor Unions called for the eight-hour day to start as of May 1, 1886. Although this might have been somewhat ignored at first, in 1886 demonstrations did in fact break out in many major cities. Thousands of workers in places such as Pittsburgh, Baltimore, and St. Louis went on strike or demonstrated in an effort to advance this cause.

The eight-hour issue culminated in Chicago in May of 1886. Chicago was considered to be the center of the eight-hour day movement, and with relations between workers and employers already at a feverish pitch, violence became virtually inevitable. Demonstrations at the McCormick Reaper Works in early May ended in violence between striking workers and police, resulting in several deaths. A group of Anarchists, led by August Spies and Albert Parsons, called for a demonstration on May 4 to protest the police brutality. Although Chicago mayor Carter Harrison found the assembly to be peaceful, and having warned the police not to interfere, the police did in fact raid the meeting just after Harrison left. An unknown person threw a dynamite bomb, killing several policemen. Remaining police opened fire on the crowd, killing other members of the crowd. Spies and Parsons were among the four men who would eventually be convicted and executed for the bombing and conspiracy, although there was no evidence linking them to the act.

As the labor movement became more organized in associations such as the Knights of Labor and the American Federation of Labor (AFL), so did the call for eight-hour day legislation, even though many labor leaders such as the AFL's Samuel Gompers did not always believe legislation would help much. Laws could be easily repealed by a future legislature or declared unconstitutional by the courts. Local labor organizations especially led the drive for legislation. But, again, enforcement was difficult. In the states where laws were passed and upheld by the courts, compliance was easily evaded. One reason was a loophole in many of these laws. Employers could contract with their workers for a longer day. Of course, the employee would either comply in the "request" for longer hours or not have a job. Furthermore, state enforcement might fall under any number of departments, or, just be ignored altogether. What also added to the situation was that farmers had little, if any, sympathy for the eight-hour day. Many farmers considered the urban factory workers to be whiners, especially since agricultural production could run as long as sixteen hours a day.

A landmark case involving the limitation of work hours came in 1908 with the U.S. Supreme Court case of *Muller v. Oregon*. In 1903, the state of Oregon passed a law limiting the number of hours females could work to ten. The law was, of course, challenged. The case reached the Supreme Court, which upheld the act. Arguing in favor of the law was the future Supreme Court justice Louis Brandeis, who did not rely upon legal precedent but instead presented a variety of arguments based on sociological, medical, and historical evidence. Opponents to the law argued that the act violated the freedom of contract as protected by both the Constitution and the Fourteenth Amendment. The Supreme Court, however, saw that the law protected the health and well-being of women.

Regardless of any shortcomings, the eight-hour day movement continued to gain momentum in the early twentieth century. At the AFL convention in 1913, there was a push to institute the eight-hour day along with stringent enforcement provisions. One issue surrounding this drive was who should be included, such as specific trades, women, and minority groups. Many argued that any laws should cover all workers, regardless of trade, race, or gender. The AFL would often back away from the eight-hour issue, and the issues of enforcement and inclusion would continue to divide the labor movement for years.

The federal government passed eight-hour laws on an irregular basis. During the presidential admin-

EIGHT HOURS
Music by Jesse Henry Jones

ca. 1866

"Eight Hours," written sometime around 1866, was a popular song among trade unionists and labor activists in the nineteenth-century struggle to improve working conditions in the workplace through reducing the workday.

We mean to make things over, we are tired of toil for naught,
With but bare enough to live upon, and never an hour for thought;
We want to feel the sunshine, and we want to smell the flowers,
We are sure that God has will'd it, and we mean to have eight hours.
We're summoning our forces from the shipyard, shop, and mill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

The beasts that graze the hillside, and the birds that wander free,
In the life that God has meted have a better lot than we.
Oh! hands and hearts are weary, and homes are heavy with dole;
If our life's to be filled with drudgery, what need of a human soul!
Shout, shout the lusty rally from shipyard, shop, and mill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

The voice of God within us is calling us to stand
Erect, as is becoming to the work of his right hand.
Should he, to whom the maker his glorious image gave,
The meanest of his creatures crouch, a bread and butter slave?
Let the shout ring down the valleys and echo from ev'ry hill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

Ye deem they're feeble voices that are raised in labor's cause?
But bethink ye of the torrent, and the wild tornado's laws!
We say not toil's uprising in terror's shape will come,
Yet the world were wise to listen to the monitory hum,
Soon, soon the deep-toned rally shall all the nations thrill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

From factories and workshops, in long and weary lines,
From all the sweltering forges, and from out the sunless mines,
Wherever toil is wasting the force of life to live,
There the bent and battered armies come to claim what God doth give,
And the blazon on their banner doth with hope the nations fill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

Hurrah, hurrah for labor! for it shall arise in might;
It has filled the world with plenty, it shall fill the world with light;
Hurrah, hurrah for labor! it is mustering all its powers,
And shall march along to victory with the banner of Eight Hours!
Shout, shout the echoing rally till all the welkin thrill:
Eight hours for work, eight hours for rest, eight hours for what we will!
Eight hours for work, eight hours for rest, eight hours for what we will!

Source: Philip S. Foner, *American Labor Songs of the Nineteenth Century* (Urbana: University of Illinois Press, 1975).

istration of Woodrow Wilson, Congress passed an eight-hour law for railroad workers, which was met with fierce opposition by railroad employers. The law was set to take effect on January 1, 1917. With America's growing involvement in World War I, a compromise was needed and was ultimately reached.

Upon the conclusion of World War I, strikes for the eight-hour day swept through many segments of the labor movement, beginning with textiles and moving on from there. However, with the Great Depression and subsequent New Deal, the eight-hour day took a back seat to more pressing matters at first. Franklin D. Roosevelt's New Deal was more interested in jump-starting the economy and putting people back to work than worrying about hours. Although people were certainly interested in not having to work incredibly long hours, having a job at all was more important. Then, in 1936, came the Walsh-Healey Public Contracts Act. This law concerned government contractors, with one of the provisions limiting the number of work hours a day to eight, with time-and-a-half pay for overtime worked within a twenty-four-hour period.

Later in the New Deal came the Fair Labor Standards Act (FLSA) of 1938. Although this Act included exemptions for people engaged in fields such as ag-

riculture and domestic service, businesses involved in or affecting interstate commerce were required to have a forty-hour work week. Other provisions were made regarding wages and overtime pay.

The eight-hour workday is still considered to be ideal. Although there might be legislation, local or national, establishing the number of hours in which one might work, contracting the number of hours in a work week is still between the employer and employee. Many companies today utilize "flex time," whereby employees can select their daily starting and finishing times, as long as they work the minimum required weekly hours. In many positions overtime is not paid but is merely considered to be part of the job. For those working under union contracts, the standard work week is laid out, along with provisions for overtime compensation. Although the eight-hour day, with forty hours per week, is thought to be the standard, the actual work week varies from profession to profession. Some companies do not even require forty hours, with work weeks from thirty-five to thirty-seven and a half hours.

The fight for the eight-hour day was long and hard-fought. Many people died for the cause, and the issue even divided the labor movement at times. Regardless, the drive to establish eight hours as a standard workday would leave long-lasting marks on those who must work for a living.

Syndicalism and the Industrial Workers of the World

Many scholars consider Syndicalism as one of the influential "left" ideologies of the twentieth century, within the increasingly problematic definition of a left-right political spectrum. However, consensus seems to end there, and the history of Syndicalism and its role in the United States has proven to be one of the oldest scholarly battlegrounds, perhaps rightly reflecting the colorful and often violent memories associated with this term. Controversies emerge as soon as the term is used, along with a plethora of meanings and experiences associated with Syndicalism. Is Syndicalism the same thing as "revolutionary syndicalism," or perhaps "anarcho-syndicalism"? Are they significantly different versions of the same basic concepts, diverging in their paths through time? Or is it the same idea everywhere, but with different experiences? Is the United States "exceptional"? The list of questions can certainly get exhaustive.

Perhaps a good place to start would be to describe what Syndicalism *is not*. A common thread observable through all Syndicalist movements has been their sometimes incoherent efforts to distinguish themselves from Socialist (and later Communist) movements. Drawing exact lines between movements and people associated with labels such as "Syndicalist" or "Socialist" is often not a very meaningful task, for there is significant overlap and confusion in ideas and actions. However, distinctions and differences exist, and Syndicalist movements' insistence on rejecting most legal-political forms of action and deep skepticism of Socialist parliamentary tactics can be considered as major division lines among "left" labor movements. By far the most spectacular and observable Syndicalist tactics to achieve social change as well as short-term gains include direct action, sabotage, and the general strike. Political participation and change through the formal political system are considered a waste of effort; the real power to change society goes through direct action, where workplace problems are solved without intermediaries, augmented by carefully aimed acts of industrial sabotage, all leading to the ultimate Syndicalist weapon, the general strike. The general strike, conceived as the point where workers' control and initiative of production is depicted and ultimately realized, brings about the end of capitalism by paralyzing its vital productive and commercial elements, while at the same time opening the way for a new society based on the control of all production through *syndicats*, or (in a historically specific context) "industrial unions."

Historically, Syndicalism can be traced back to nineteenth-century "left" political and workers' movements defining themselves as Socialist or Anarchist. Late-nineteenth-century continental Europe, especially France, is considered to have witnessed the creation of what would be called "anarcho-syndicalism," "Syndicalism," or an early version of "industrial unionism" around the world. Various elements of Socialist labor organization, such as the perception of the working class as the key agent of social change, as well as elements of Anarchism, observable in the lack of trust toward centralization and state authority, form the ideological foundation on which Syndicalism stands. The French experience is usually associated with the *Confédération Générale du Travail* (CGT), with an ongoing debate concerning its exact influence on the American experience. Syndicalism seems to be alive in the twenty-first century, with all the characteristic, eclectic togetherness of ideologies and images. One can see the black cat of sabotage on the walls, along with environmentalist slogans, black-and-red flags, and pro-labor pamphlets in the so-called antiglobalization" rallies. Tracing the story of Syndicalism in the United States requires an almost exclusive attention to the Industrial Workers of the World (IWW), whose fate and influence very closely reflect the fortunes of the ideology and movement in its context.

The Industrial Workers of the World

The Industrial Workers of the World (IWW) was founded at a 1905 convention in Chicago after a series of conferences and was immediately welcomed by the first speaker, "Big Bill" Haywood, as "the Continental Congress of the working class." It appears that the phrasing was somewhat exaggerated, for although the convention had brought together numerous unions and political organizations, the number of workers represented with voting rights was a mere 50,000 (overall, indirect representation was around 140,000)—a very small portion of organized labor at the time and a fraction of all workers in the United States. Although numbers would never prove to be a significant strength of the IWW through its history, its historical influence, either as exercised by the IWW as an active organization or as a myth, had little to do with numerical strength.

If the first convention in Chicago did not represent a numerical strength, it certainly succeeded in assembling an impressive variety of groups and ideas. From the populous Western Federation of Miners (WFM) represented by the influential Haywood to a variety of small American Federation of Labor (AFL) locals, the IWW represented a chaotic and eclectic amalgam of purposes, ideologies, and characters. Branding the organization at its creation as Syndicalist or Socialist would be an unsupported speculation, because what would later become the Syndicalist elements coexisted with Daniel De Leon's doctrinaire Socialist Labor Party (SLP; it was represented through the party's union wing, the Socialist Trade and Labor Alliance), Eugene V. Debs's Socialist Party of America

Founded in 1905, the Industrial Workers of the World sought to organize unskilled, factory, and migrant workers—groups often ignored by other unions. *(Brown Brothers)*

WILLIAM D. "Big Bill" HAYWOOD (1869–1928)

Born in Salt Lake City, Utah, on February 9, 1869, William Dudley Haywood began work as a miner at a young age to help support his family. In 1896, he joined the newly organized Western Federation of Miners (WFM), and in 1900 he became a member of the executive board and national secretary-treasurer of the organization. He traveled throughout the West as a union organizer. Because of increasing conflicts between miners and mine owners, Haywood often traveled secretly through embattled mining camps to avoid arrest. Haywood and the Western Federation of Miners campaigned for eight-hour working days for underground miners. Most mining camps required underground workers to labor ten hours on the job each day, not counting transportation time up and down the mine shafts, and to work thirteen out of fourteen days. Because of the WFM efforts, Utah became the first state in the nation to enact an eight-hour workday for miners.

A militant leader, Haywood was often accused of inciting violence, especially in the Colorado troubles culminating in the Cripple Creek strike of 1904. He was also accused of instigating the assassination of former governor Frank Steunenberg of Idaho in 1905, but was acquitted in a trial in which the high-profile trial attorney Clarence S. Darrow defended him. The trial attracted nationwide attention. Though eventually found not guilty, the ordeal led to fighting between Haywood and Charles Moyer, one of the other leaders of the WFM, about the direction of the organization. Haywood left it in 1908.

In 1905, Haywood helped organize the Industrial Workers of the World (IWW). He joined the Socialist Party and became a member of its national executive board, but because of his advocacy of violence was forced out of the party. He led the famous Lawrence and Paterson textile workers' strikes in 1912 and 1913, respectively. Repudiating the crafts union ideal and the cooperation policy of the American Federation of Labor, he preached the IWW doctrines of class struggle, no compromise, and mass action. He became head of it in 1915 and forged an image of the IWW as a group that would use any means at its disposal to change a system it despised. At its peak, the group had more than three million members.

When the United States entered World War I, Haywood was arrested on a charge of sedition, and was tried, convicted, and sentenced to twenty years' imprisonment. While awaiting a new trial in 1921, he forfeited bail and escaped to the Soviet Union, where he lived for the rest of his life. He became a trusted adviser to the new Bolshevik government. He died on May 18, 1928. Half of his ashes were ceremoniously buried in a wall of honor at the Kremlin, next to the remains of American journalist and Communist sympathizer John Reed. The remainder were quietly returned to the United States and buried in Chicago, near a monument to American workers.

James G. Lewis

(SP), numerous labor organizers who for various reasons had been unable to achieve career ambitions with the AFL, and colorful individuals like "father" Thomas J. Hagerty—the author of the famous preamble to the IWW constitution, the 1905 manifesto, and the creator of an organizational chart of industrial unions, also known as "Father Hagerty's Wheel of Fortune," forming the "One Big Union."

Haywood's opening speech was supported and well received by the audience; his emphases on themes of solidarity, class struggle, and disdain for the "pure and simple" craft unionism of the AFL had reached a crowd very much in agreement with these sentiments. Controversial issues remained in place, however, and would prove to be dangerous fault lines that would endure throughout the history of the IWW.

The WFM, forming the core membership and financial source of the newly created IWW, had brought its experience of bitter struggles and a fiery, independent "Western" streak, as well as the conviction that a peaceful coexistence of employers (or "capitalists") and workers was unattainable. Experiences gained through hard-fought—and lost—strikes and struggles in Colorado had shown the WFM the futility of favorable court decisions when governors would refuse to enforce them. Losing strikes while locals were dismantled only served to enhance the idea that dependence on legal institutions for protection against employers was a recipe for disaster. This line, along with a distrust of political affiliations and the political processes in general, had a lot in common with what would be called American Syndicalism in a few years.

Among the purely political groups, both the SLP and the SP intended to steer the newly formed orga-

nization as a branch of the party apparatus. Homogeneity had never been one of the defining elements of socialist movements, however, and this situation was no different. To summarize, certain elements within the SLP as well as the SP advocated a position against the dominant "boring from within" attitude. As a tactic, "boring from within" meant that socialists would organize within existing trade unions, radicalize, or "educate" the workers who had "false consciousness" in these unions, and place them in line with party functions and ideals. The opposing groups saw in the IWW a potential to become a genuine class-conscious organization of industrial unions, making the trade unions and AFL craft unionism obsolescent by its very existence. Most Socialists still had high hopes for converting the AFL, but the IWW was at the center of many arguments nevertheless. What made many Socialists most uncomfortable with the IWW was the strong position of ideas that advocated success primarily at the workshop, not the ballot box.

The IWW and its Opponents

Problems within the IWW were to play a decisive role throughout its history, but the IWW fully expected opposition from a variety of outside sources as well and had no trouble finding it. The AFL, under Samuel Gompers, had grown from its small beginnings when the Knights of Labor dominated the scene briefly in the second half of the nineteenth century, into the largest federation of unions in the United States. Gompers had created an organization that thrived not on conflict but on agreements that brought small, immediate, incremental gains. Gompers's insistence on craft unionism and the significant number of skilled workers organized within the AFL meant that it mostly aimed to represent the interests of the skilled minority while a large majority of the working class in the United States was left out. Although the IWW represented a small number of workers, its radical rhetoric and aims led Gompers to believe that the IWW posed a threat, aiming to replace the AFL, although his agents within the IWW had informed him otherwise after observing the chaos and conflict of interests already evident in the infant organization. Consequently, Gompers told all members not to support IWW strikes and reminded them that strikebreaking was acceptable in such situations. WFM locals were purged from AFL-affiliated organizations, and aid to the WFM was halted.

As the AFL attack continued, suspicious SP members also voiced their opinions about the IWW. Although Debs and other prominent names of the SP endorsed the organization, there was widespread suspicion among Socialists concerning De Leon and the SLP. The IWW seemed to have united the SP and the SLP at least on a small common ground, but suspicion of another split led by De Leon never wavered. The "boring from within" attitude also continued to dominate the SP, and supporters of the tactic became increasingly aggressive as they perceived the IWW as not only a hopeless attempt, but also a weakening influence on their work within the AFL, since it attracted socialists and other radicals.

As the newly created IWW struggled with problems inside and outside, government authorities, backed by negative public sentiment, were about to start a long and torturous period of harassment at all levels. The first event exemplifying this attitude was triggered by the murder of a former governor of Idaho in Caldwell. As soon as the local authorities had a suspect, they started working on establishing connections to prominent figures of the WFM.

The fact that a connection had not been established and that the suspected conspirators were in Colorado did not deter the authorities. After an interstate abduction spree, Haywood, Charles Moyer (president of the WFM), and George A. Pettibone were brought to Idaho and imprisoned. Appeals by union attorneys ended in failure, and although the juries eventually found them to be not guilty, they did spend a critical time in prison. A critical time indeed, since the IWW was experiencing severe crises and the absence of experienced, charismatic leadership at such a time seriously hampered its survival efforts, let alone attempts to grow. During the absence of Haywood and Moyer, the IWW experienced an ossification of existing differences among its groups, as socialists struggled against De Leon's SLP, and the WFM was torn between factions favoring a "revolutionary" IWW and a "respectable" IWW. In the meantime, the first (and only) IWW president, Charles O. Sherman, and secretary-treasurer William E. Trautmann became involved in these factional struggles and were positioned against each other. It certainly appeared that a serious conflict was going to take place at the second convention, and there would be no surprises. The long-term result of the second convention became clearer as the years 1907–1908 would witness the first big schism in the history of the IWW, with major consequences.

Decline of the IWW and its Historical Legacy

Meanwhile, the factional struggles within the WFM gathered momentum, as Vincent St. John and his supporters who favored a revolutionary IWW slowly lost ground. After bitter struggling, efforts to keep the WFM in the IWW failed, and this most populous and resourceful element of the IWW withdrew, leaving what appeared to be a union on the brink of collapse. By the time Haywood and St. John were trying to save the IWW, De Leon's aims and tactics had attracted much suspicion and hostility. Through his attempts to stop SP influence in the IWW, De Leon had succeeded in implementing what was called a "political clause," where a party affiliation was not allowed, but political action was acceptable. However, the alliances he had established with direct action supporters two years before had crumbled, while his image as an intellectual alienated from the workers grew in strength. The year 1908 witnessed the second split, this time during the convention. De Leon and his followers, banished by the IWW, left and established a paper IWW in New Jersey, and then moved to Detroit. The paper IWW never had much influence, and after the death of its founder in 1914, it eventually died out.

By the time the damaging internal struggles in 1908 came to a climax, the IWW had lost a significant portion of its membership and resources with the loss of the WFM (in 1907), alienated remaining SP figures such as Debs, and thrown out De Leon and the SLP affiliates. Even during such a time of troubles, however, the IWW had organized and engaged in conflicts in a wide geographic area. From the textile workers in the East (Paterson, New Jersey, Providence, Rhode Island, Lawrence, Massachusetts, et al.) to Goldfield, Nevada, and timber workers of the Northwest, the IWW worked actively in organizing and striking, even if the strikes were not necessarily successes.

Although the IWW had organized some skilled and permanent workers, it also proved to be the only

Leaders of the Industrial Workers of the World pose in front of a dye factory. Among those featured are William "Big Bill" Haywood (seated, far right) and, beside him, Elizabeth Gurley Flynn. *(Brown Brothers)*

union that actively attempted to organize unskilled immigrants (including Japanese workers, who were excluded by all other unions) and itinerant workers. The internal success of the "Syndicalist faction," combined with what critics labeled as "hobo unionism," created an image of the IWW as an alienated, weak union of anarchists and unemployed workers. Although badly shaken by lack of funds and organizational chaos, the IWW nevertheless survived and possessed the basis of what was to constitute the "Wobbly" myth for decades.

The ideological product of developments in the IWW during this period was a mixture of elements: they borrowed a significant amount from Marx, in terms of the understanding of history as class struggle and "laws" of social change, from Anarchists' and Syndicalists' notions such as direct action, sabotage, and the general strike, and mixed these with already-existing elements such as the spirit of frontier activism and initiative, among others. The result was hardly a coherent body forming a unique ideological framework; but it was certainly not a repetition of other movements and ideas, within or without the United States. A good example of the particular mixture of ideas the IWW created is the antipathy concerning political action. Although Anarchists and many Syndicalists had looked upon political action unfavorably, if not with hostility, the attitude of the IWW was as much a result of such external influences and previous experience of some of its members as it was the result of direct, new experience gained during the bitter battles involving Socialists and the SLP. Although the IWW never let go of its vision of revolution, socially ultimate ends were not necessarily of foremost importance on the agenda in the struggles that it pursued, trying to improve the immediate conditions of the workers it tried to organize.

In the aftermath of the 1907–1908 emigration, the IWW began a period of intensive struggles in both the West and the East. In the West, what would be known as "free speech fights" erupted, with significant results in locations such as Spokane, Washington (1909–1910) and Fresno, California (1910–1911). In Spokane, the IWW organized a number of migratory workers who had to work in primitive, brutal conditions. Their success did not go unnoticed, as the city council soon banned IWW soapboxers from the streets, employing an argument of nationalism and religion. The IWW refused to stop, and in less than a month, the Spokane jail was overfilled with Wobblies who had continued to give speeches. As workers started to leave Spokane for jobs, the IWW orators were released. As soon as the workers returned, a similar procession of events commenced; IWW orators started making speeches, and they were promptly put in jail. By the time the struggle ended, hundreds of Wobblies would be imprisoned. The conditions in the prisons were not only primitive, but also designed to weaken and break the spirits of the prisoners. Climatic extremes, lack of sanitary measures, and brutality in general left a majority of prisoners with permanent health problems.

As the fight became ever more costly for the authorities in Spokane, they wavered. The jails were full, but the IWW was still there, in numbers. The numerous tales of brutality and injustice against the IWW influenced even public opinion, resulting in more pressure on city authorities. Finally, in 1910, nonviolent resistance and determination prevailed, and the IWW achieved its goals. They could publish the *Industrial Worker* and freely organize indoor or outdoor meetings. Similar "free speech fights" with similar results took place in a variety of Western cities for a few more years, with exceptions such as San Diego, California, where success proved to be elusive in the face of determined opposition by local authorities and lack of intervention by higher authorities.

The IWW had gained a number of skilled organizers and a larger number of determined followers by the end of the "free speech fights," and it would need them all in the immediate future. Joseph Ettor, one of the highly skilled and experienced organizers of the IWW, arrived in Lawrence, Massachusetts, in early 1912, invited by a local Italian IWW.

Low wages and long hours in the textile mills of Lawrence had culminated in widespread anger and dissatisfaction among the workers who were mostly immigrants. However, not all ethnicities supported the idea of a strike; from the start, the most enthusiastic support for a strike came from the less well-established groups, mostly from Southern and Eastern Europe. Haywood also marked his return to active organizing when he showed up in Lawrence and was warmly greeted by a great number of workers. Accompanying Ettor was Arturo Giovannitti, soon to become a well-known character in the history of the IWW. Strike committees and relief committees were immediately formed with the combined work of the local strikers and national IWW organizers. Limited demands were drawn up, and they were put forth again and again in regular parades, picket lines, and music. In a short time, the number of workers who stopped work grew so that the mills were crippled and the strike was well under way.

Although the IWW in Lawrence never supported

violence, perhaps inevitably, clashes among militia, the police, and the strikers occurred. By the time strikebreakers were introduced, the atmosphere was already full of tension. When a police officer was stabbed and a striker was shot and killed, a group of people including, unsurprisingly, Ettor and Giovannitti were identified as the conspirators by the police. As the leaders of the strike were put in jail, however, reinforcements from the IWW had come; Elizabeth Gurley Flynn (the "rebel girl") and William E. Trautmann had joined Haywood to replace them. The IWW proved to be extremely resourceful in organizing the strike, creating committees to alleviate the problems strikers faced, and even imported the tactic of sending strikers' children outside the strike zone so they could be taken care of by willing families. Every act contributed to greater publicity, and the local businesses and authorities contributed to the publicity by acts of brutality and stubbornness. In about two months, the mill owners capitulated, accepting the demands of the strike committee. Haywood and other Wobblies were ecstatic over the victory; things appeared to be changing for the IWW indeed. Ettor and Giovannitti were acquitted a few months following the strike.

Through the success of the Lawrence strike, the IWW had succeeded in signing up new members and had gained a lot of publicity. The successes did not follow, however, even in Lawrence, as mill owners (the American Woolen Company) playing one ethnicity against the other and using spies to infiltrate the union and the media influenced public opinion negatively toward the IWW. The following year would put all the strength and morale of the organization to the test, at Paterson, New Jersey.

Similar in some ways to Lawrence, Paterson was also an old industrial town, and labor was similarly divided into ethnic groups. The IWW did not really "lead" the strike here but served as organizing and advisory assistance. In addition to figures like Flynn and Haywood, Carlo Tresca, an anarchist with close ties to syndicalism—and to Flynn—made an appearance. Although similar tactics to those used in Lawrence were employed, Paterson proved to be a different testing ground. When material support for the strikers wavered and new drives for funding (John Reed's famous Pageant of the strike included) were unsuccessful, cracks along ethnic and ideological lines appeared fast. Things fell apart quickly, and the strike ended in defeat, with Socialists, the AFL, and the media all critiquing the IWW.

ELIZABETH GURLEY FLYNN

(1890–1964)

Born on August 7, 1890, in Concord, New Hampshire, Elizabeth Gurley Flynn was the daughter of working-class Socialists. She showed an early talent for public speaking on social issues. Thrown out of school in 1907 for her political activities, she became an organizer for the Industrial Workers of the World (IWW). She took part in the IWW's "free speech" campaigns in western mining towns and was arrested dozens of times; she also helped organize strikes or raise relief and legal defense funds. In 1918, she helped establish the Workers' Liberty Defense Union, which was founded to protect immigrants from being deported and to give them financial and legal help. She served as secretary of the Workers' Liberty Defense Union until 1922. She also worked for women's suffrage, peace, birth control, and other progressive causes, and was one of the founders of the American Civil Liberties Union in 1920.

In the 1920s, Flynn was a key fundraiser in the Nicola Sacco and Bartolomeo Vanzetti case. After that case ended in 1927, a heart ailment forced her out of action for several years. In 1936, she joined the Communist Party and became one of its outspoken leaders in the United States. Three years later she was removed from the national committee of the American Civil Liberties Union for her Communist Party membership. She was arrested along with twelve other Communist leaders in 1951, at the height of the McCarthy period, and was incarcerated in January 1951. She published *I Speak My Own Piece: Autobiography of "The Rebel Girl"* in 1955.

Flynn served as chair of the Communist Party of America from 1961 to 1964, the first woman to hold that post. In a suit that went to the U.S. Supreme Court, *Aptheker v. Secretary of State* (1964), she and Herbert Aptheker, the editor of the Party's journal *Political Affairs*, challenged the constitutionality of a provision of the Subversive Activities Control Act of 1950 that denied the issuance of passports to Communists. When they won the suit in 1964, she promptly secured a passport in order to visit the Soviet Union. She died in Moscow on September 5, 1964, and was given a state funeral in Red Square.

James G. Lewis

Legacy of the IWW

If the IWW won limited gains and lost most of the time in actual industrial warfare, it certainly did not lack in mythology and influential discourse. IWW songs, slogans, caricatures, and language would prove to be enduring aspects of the IWW legacy. Martyrs also added to the charisma and culture of the Wobbly phenomenon. Joe Hill, a "Wobbly bard," was tried and sentenced to death for a murder charge in 1914; the resulting effort to defend him had international dimensions, but the uproar did not help him. In 1915, he was executed in Utah and after an elaborate funeral, buried near the Haymarket martyrs. Two years later, Frank Little, a well-known IWW organizer, would be added to the martyr mythology after being lynched by a Butte, Montana, vigilante mob for his "unpatriotic" antiwar speeches and agitation.

On the organizing front, the IWW experienced significant successes through most of World War I (when it was particularly under attack after 1917 for being "subversive and unpatriotic," with allegations that it received "Kaiser's gold"), especially during 1916 when it successfully organized the agricultural migratory workers of the Midwest under the Agricultural Workers Organization (AWO). Several short-lived successes followed in the Mesabi range (Minnesota) mining region, but once again, the IWW was unable to build a lasting organization after the gains it had helped achieve. Meanwhile, the IWW had returned to organize the lumber workers of the Northwest, and trouble was not far behind.

Trying to support the soapboxers who were jailed and then taken out in the middle of a forest and made to run back naked as they were beaten by the vigilantes (dubbed the "Everett Massacre"), the IWW planned to invade Everett, Washington, with hundreds of workers from Seattle. As the boats from Seattle arrived at Everett's docks, they were met by a group of vigilantes, led by local authorities. It is still not clear who fired the first shot, but the scene immediately degenerated into a bloody confrontation, and by the time the boats left the docks, several people on both sides were dead, with many wounded. The massacre increased publicity and sympathy for the IWW, however, and the brutality it did not fear to face made an impression on many workers.

The 1916 convention of the IWW came at a time when, for the first time in its history, the organization had some funds thanks to the successes of the AWO, lots of publicity, and morale boosting from recent events; Haywood tried to transform the IWW from an organization of agitators and soapboxers into one of more permanent labor organizers. The entry of the United States into World War I in 1917, however, along with the renewed hostility the IWW was about to face, changed the course of events in a way Haywood probably never wanted to witness. The immediate result of the United States' entry into the war was an increase in demand for labor, which seemed to be an opportunity for IWW organizers. They also recognized the danger in producing antiwar propaganda without addressing the patriotism of the workers. The turn toward patriotism by the working classes of Europe when the war started stood as a dark example before the IWW. One of the poems produced at the time reflects the IWW's position rather brightly:

I love my flag, I do, I do,
Which floats upon the breeze,
I also love my arms and legs,
And neck, and nose, and knees.
One little shell might spoil them all
Or give them such a twist,
They would be of no use to me;
I guess I won't enlist.

The indirect approach to the issue of conscription, however, proved to be insufficient to protect the IWW from aggression. Employers, realizing the opportunity to use the rhetoric of patriotism and treason, responded to the recent gains of the IWW with public opinion at their back. The industries IWW had organized most successfully—agriculture, lumber, mining, and transport—were also among the most critical for the ongoing U.S. war effort, a situation that certainly did not help the IWW in strikes. Opposed by the government at all levels, as well as the judicial system, employers, and vigilante mobs, the Wobblies faced perhaps the greatest crisis of survival in their history, which ultimately ended in disaster. Authorized or supported by every possible agency and authority, federal agents conducted massive raids at all locations where the IWW was organized. They took away documents, publishing material, office supplies, and publications, apparently in order to prove the IWW had indeed accepted German gold and that it was involved in treason. The actual aim was more general, however: the destruction of the IWW. A massive wave of arrests followed soon after, with all the leadership and many members placed under arrest, facing a variety of charges. During 1918–1919, as the massive IWW trials continued, the aftershocks of the Revolu-

tion in Russia were being felt. The hysteria that would aid the infamous "Red Scare" (or "Palmer Raids") of 1919–1921 was in the making. The trials, where the IWW still had some hope since it had won courtroom battles before, have been defined by many scholars as a circus, and the leadership was found guilty on all charges.

By 1919, the IWW was certainly in disarray, though not yet destroyed. A series of decisions taken at the 1919 convention of the IWW, however, resulted in the exclusion of all experienced leadership in the organization. At a time when massive waves of arrests followed by speedy trials (or no trials) and prompt deportations or imprisonment was about to begin, getting rid of the seasoned leadership did not help. The first instances of the Palmer Raids also coincided with an armed conflict and lynching where the IWW was involved, this time in Centralia, Washington. What followed, with the arrests, deportations, and laws in supporting these acts (the Criminal Syndicalism Law), was the dismantling of not only the IWW, but also most radical organizations housing immigrants in the United States.

The flight to Russia of Haywood, who had symbolized the IWW for such a long time, was a particularly traumatic event, and it probably signifies the end of the IWW's truly influential and significant years. He died in 1928 in Moscow, a lonely and disillusioned man. Some of his ashes were buried under the Kremlin wall, and the rest were placed in Chicago, near the burial place of the Haymarket Anarchists.

As the issue of Communism took a greater part of the debates within the dissolving IWW, the lack of experienced leadership, internal factional divisions, and chronic lack of funds pushed the organization into complete collapse by 1924. Unlike the 1906–1908 splits, however, there was no new energy, and the context had changed. Communism was going to be the central paradigm and topic of debate in the "left" for decades to come, and the battered remnants of the IWW could not hope to challenge a triumphant alliance of employers, courts, and governments as it had done so many times before.

Although the IWW did not cease to exist, after 1924 it was a mere shadow of what it had been, and as an organization it never regained the strength and momentum it had during the first two decades of the twentieth century. However, the influence the Wobblies exerted on labor and the "left" in general is certainly disproportionate to their organizational successes. Many Wobblies joined the Congress of Industrial Organizations in the 1930s, which successfully championed the cause of industrial unionism (although not really associated with Syndicalism anymore), used direct action tactics, and drew on the movement culture and mythology of the IWW. The influence was not limited to the United States either: the IWW existed in a large variety of contexts and geographical space, ranging from Australia to Norway, from South America to Canada. The lasting legacy of the Wobblies has been observed more in their songs, culture, language, and relentless determination and courage against impossible odds, and not the details of internal, organizational, or structural struggles. Characters such as Haywood, St. John, Ralph Chaplin, Joe Hill, Flynn, Ettor, and many others occupy a quasi-mythological space with the struggles, slogans, pamphlets, and caricatures of the IWW. The risk of romanticizing or underemphasizing the IWW has always existed, and the scholarship is full of examples of both, as well as examples of greater ambition, scope, and controlled historical perspective. The existing mythology might be the greatest injustice to the significance of the IWW today. One thing is certain: the legacy of the IWW, with all its different perceptions, interpretations, and analyses, is still very much with us.

Railroad Workers Movement

Railroad unions in the United States generally are not regarded as social movements, nor typically are they considered "movement" unions. Indeed, the railroad industry's almost bewildering number of unions—organized primarily along craft lines—have earned reputations as looking primarily after their own "bread-and-butter" interests. Yet, while craft unionism ultimately triumphed, the railroad industry also gave rise to some of the most celebrated industrially organized unions possessing genuine visions of larger social change. The diverse, or bipolar, nature of railroad unionism resulted from the railroads' complex occupational and racial hierarchy as well as the industry's close relationship with the national state.

Over the nineteenth and twentieth centuries, as historian Gerald Friedman has written of the broader labor movement, railroad unions organized and evolved to take advantage of economic and political opportunities, becoming more radical when the railroad corporations and the state were friendly and retreating into conservative postures under employer counterattack and hostile governmental policies. Although these "cycles of contention" help explain the rise of the "Big Four" brotherhoods of engineers, conductors, firemen, and brakemen, as well as the rest of the "standard" railway unions representing shopcraft, clerical, and maintenance-of-way workers, railwaymen nevertheless persisted in the idea of a broad organization encompassing the various railroad trades. However, craft jealousies, racial attitudes, job segmentation, and employer and state hostility prevented the emergence of "one big union."

Still, railroad unions were involved in some of the most dramatic and important instances of labor conflict, and their persistence contributed to the development of some of the most important industrial relations and social welfare legislation in U.S. history. Moreover, those railroaders who faced the greatest struggle—African Americans—played an important role in the modern civil rights movement.

The earliest known railroad union developed among skilled workers in the running trades (or "operating crafts") following the first major wave of nineteenth-century railroad construction and consolidation in the 1850s. The Brotherhood of Locomotive Engineers (BLE), founded in 1863, had its origins in a union of engineers that existed briefly in the mid-1850s. Vigorously led by William D. Robinson, who had served as secretary of the earlier union, the BLE distinguished itself by its aggressive defense of wages on a national level, conducting a series of strikes in 1864. However, the force of the railroad corporations' response precipitated a debate within the BLE, resulting in the ousting of Robinson and his replacement by the careful Charles Wilson as Grand Chief Engineer later that year. With Wilson, the BLE backed away from direct confrontation with capital, choosing instead to emphasize benevolent work. In the process, it took on the conservative character that it and the brotherhoods of conductors, firemen, and brakemen would be known for.

The Order of Railway Conductors (ORC), the Brotherhood of Locomotive Firemen (BLF), and the Brotherhood of Railroad Brakemen (later renamed Brotherhood of Railroad Trainmen, BRT) followed the Locomotive Engineers' example, organizing themselves in 1868, 1873, and 1883, respectively. Together, these unions became known as the Big Four railroad brotherhoods. Sometimes the Switchmen's Mutual Aid Association (SMAA), which came into being in the late 1870s and was succeeded by the Switchmen's Union of North America (SUNA) after 1900, is included in this group.

The distinctive features of the Big Four railroad brotherhoods were their craft conservatism and fraternal character. Drawing upon Masonic fraternalism, early brotherhood leaders emphasized the principles

of mutual aid, ranging from the visiting of sick or injured members to the provision of death and disability insurance, and moral uplift, ranging from technical instruction to the inculcation of sober and industrious habits through speeches and prescriptive literature. The efforts at mutual aid met a very real material need among men who labored in a hazardous industry, while the attention to moral uplift emphasized the individual self-improvement and upward mobility of laboring men. Brotherhood leaders believed that the magic and drama of fraternal ritual, the promise of moral uplift, and the tangible benefits of fraternal insurance would make them attractive to skilled railwaymen. At the same time, they hoped the mainstream legitimacy of fraternalism, together with their own benefit work, moral uplift practice, stated reluctance to strike, and scrupulous observance of contracts, would make them acceptable to railway managers as trustworthy representatives of skilled railway labor. And, indeed, during the 1880s, the brotherhoods experienced something of a golden age as railroad expansion and a tight labor market enabled them to negotiate favorable agreements on a number of roads. Together with their craft orientation, this success encouraged the brotherhoods to chart a separate course from that of the larger labor movement, refusing protective alliances with other segments of organized railroad labor and declining affiliation with the American Federation of Labor (AFL).

The railroad brotherhoods were not the only unions to organize railwaymen in the United States, a fact demonstrated by the rise and fall of a number of more broadly based unions from the mid-1870s through the mid-1890s. During the depression and labor conflict of the 1870s, a number of railroad workers organized episodic proto-industrial unions, the most significant of which was the Brakemen's Brotherhood and Trainmen's Union, organized in 1873 and 1877, respectively. These unions either included multiple grades of railroad workers or acted to provide organizational support for broader industrial action, and in the case of the nationwide railroad strikes that played the central role in the "Great Uprising of 1877," they served to mobilize railwaymen against wage cuts. However, these unions did not survive the Great Uprising, with its massive employer and state response. Nevertheless, their members carried their experiences with them into the Knights of Labor (KoL).

The Knights of Labor not only stood as the most important, inclusively organized railway labor organization of the 1880s but the most important labor organization of the Gilded Age. Founded in Philadelphia in 1869, the Knights, like the brotherhoods, partook of the fraternal form, practicing secrecy and ritual, but distinguished themselves from other trade unionists by their belief in the creation of an organization that would bring together all workers, regardless of race, nationality, or occupation.

Guided by this broad moral vision, the KoL developed a genuine movement culture that at its broadest envisioned the abolition of the "wages system" and the wholesale transformation of American society. The organization grew explosively in the mid-1880s, propelled in part by the dramatic strike victory of KoL railwaymen, based mainly in the roundhouses and repair shops, against Jay Gould's Southwestern railroad system in 1885. However, a second strike in 1886 against the Gould system met with defeat and, together with the Haymarket Affair of 1886, contributed to the rapid decline of the organization. Nevertheless, the Knights remained a presence on a number of railroads and continued to provide an organizational framework linking men across trade lines and serving as "strikers' unions" when conditions on those roads became unfavorable. However, the railroad assemblies of the KoL suffered serious defeat in their strikes and by the early 1890s had all but been swept away.

The migratory streams generated by the breaking up of the Knights, as historian Shelton Stromquist has shown, led to the formation of the most important industrial railroad union of the nineteenth century, the American Railway Union (ARU), but not before the brotherhoods had encountered a series of reversals and had themselves experimented with a broader form of organization. By the late 1880s, the favorable conditions that had fostered the brotherhoods' "go it alone" attitude had changed as new railroad construction tapered off and railroad corporations adopted policies aimed at increasing the supply of skilled labor. In the Chicago, Burlington & Quincy Railroad strike of 1888, the "brotherhood" style of organization proved a bust as management easily replaced striking engineers and firemen.

For many of the men involved, the experience pointed to the need for some sort of federation among the brotherhoods; the result was the Supreme Council of the United Orders of Railway Employees. Formed in 1889, the outcome of negotiations among the firemen, brakemen, and switchmen, the Supreme Council was successful in its first year. (Conspicuously, the Engineers declined to participate, and remaining Knights assemblies were ignored.) However, jurisdictional conflict between the BRT and the SMAA, together with the reluctance of the brotherhood leaders to endorse sym-

EUGENE VICTOR DEBS (1855–1926)

Eugene Debs was a significant labor leader and the most important spokesman for the Socialist Party of America. He was born in his lifelong home of Terre Haute, Indiana. The son of French immigrants, he lived a comfortable childhood and completed a ninth-grade education. He left school to become a paint scraper on the Vandalia Railroad.

Shortly thereafter, Debs became a locomotive fireman and was an organizing member of the Terre Haute lodge of the Brotherhood of Locomotive Firemen. In his early days, Debs's approach to industrial capitalism was based on old-fashioned republican values. He believed deeply in industrial citizenship and thought that unions should build a positive and cooperative relationship with industrial capital.

In 1879, Debs tested the local political waters by serving two terms as city clerk and then a term in the Indiana state legislature. He remained an active member of the local union and saw himself as an independent citizen living in relative equality. In 1885, he married Katherine Metzel. The marriage was largely loveless, and they had no children.

Debs's concepts of harmony and cooperation were shattered by a difficult strike in 1888 against the Burlington Railroad. Burlington's unyielding position and the failure of the different railroad brotherhoods to work in unity convinced Debs that a radical departure from the present structure in terms of industrial capitalism and union structure was needed. He, therefore, turned to militant industrial unionism and a broader concept of class struggle.

Debs's first response was to develop an industrial union for all railroad workers. The American Railway Union (ARU) was established in 1893 and quickly won a strike against the Great Northern Railway. Fresh from victory, the ARU faced a much greater challenge when it took over a strike launched by workers against the Pullman Palace Car Company in 1894. When negotiations failed, Debs called for a national boycott against Pullman cars, which was resoundingly successful. But United States Attorney General Richard Olney convinced President Grover Cleveland to send federal troops to break the strike. The strike was in fact broken, and Debs was arrested and sentenced to prison for six months.

While in prison, Debs began to read Marxist literature and met with leading Socialist politicians like Victor Berger. Upon his release, Debs announced his conversion to socialism. In 1900, he became a Socialist candidate for president and then helped to organize the Socialist Party of America (SPA), formally launched in 1901. He wanted to develop a specially American-based Socialist movement that would appeal to rank-and-file workers. He avoided inner-party discussions and warfare. Instead, he traveled widely and spoke constantly to workers, always carrying the message of class struggle and empowerment. He used the four presidential campaigns from 1900 to 1912 to urge workers to support socialism, to educate, to support strikes and to help organize unions. Debs always saw the SPA as an organ to build solidarity. Though Socialist votes for president never reached more than 900,000, his speeches were enormously popular with Socialists and attracted workers, scores of local officials, and even congressmen. In 1905, he was also a founding member of the Industrial Workers of the World (known as the "Wobblies").

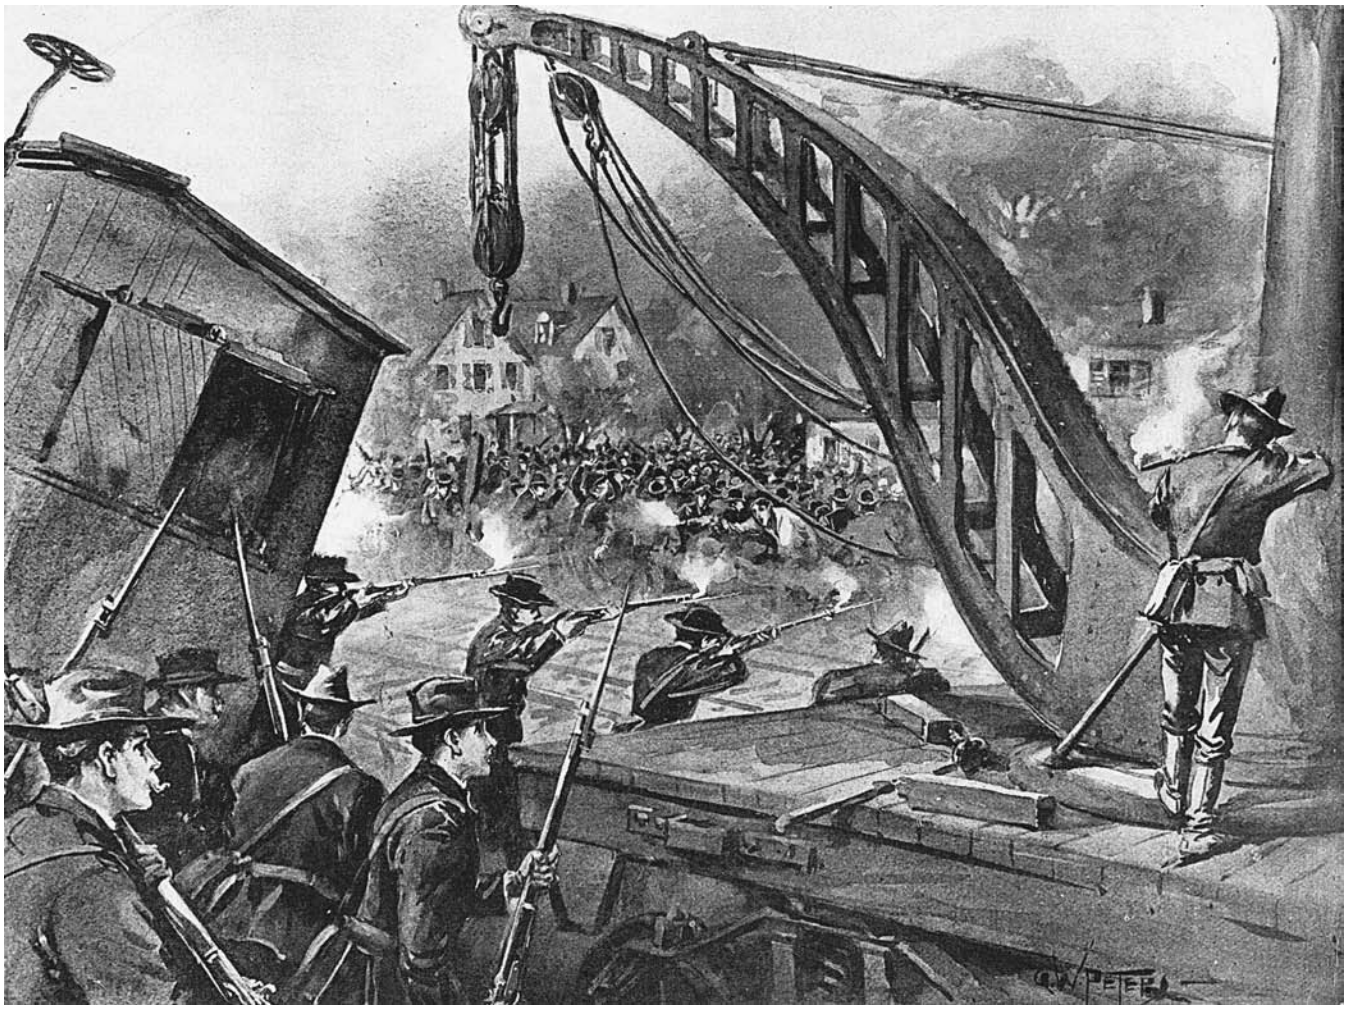
By 1916, the constant travels and massive physical effort left Debs tired and ill. Although he did not run for president in 1916, he spoke out against the war in Europe. And when the United States entered the war in 1918, Debs launched a tour of protest speeches. In Canton, Ohio, he was arrested for sedition, convicted, and sentenced to federal prison. While in prison, the SPA ran him for president in 1920 and attracted a large protest vote. Pardoned in 1921 by President Warren Harding, Debs was released from prison. Over the next five years, his health continued to deteriorate, though he never lost his dedication to working-class issues. On October 20, 1926, he died in an Illinois sanitarium.

R. David Myers

pathy strikes, led to its disillusion in its second year, rendering it dead by the summer of 1891.

THE PULLMAN STRIKE AND BOYCOTT

Even as the Supreme Council came off the rails, figures within the federation movement, most notably BLF secretary Eugene V. Debs, and the Knights, particularly District Assembly 82 representing men on the Union Pacific Railroad, began discussing the possibility of a general union of railwaymen. In early 1893, these men met to form the American Railway Union. As the first truly industrial railroad union, the ARU declared itself in favor of organizing all classes of railway employees (excepting black workers) and committed itself to thoroughgoing sympathetic action. With its vision of a strikeless era to come, the ARU



At the behest of railroad owners, President Grover Cleveland sent federal troops to break the Pullman Strike in 1894. In this violent scene, soldiers fire on a crowd of workers at the corner of Loomis and 49th streets in Chicago. *(Brown Brothers)*

caught on among railwaymen as no industrial union had before, especially among the less skilled and previously unorganized. It was this excitement and commitment to complete organization that led the young union in June 1894 to declare a boycott of Pullman cars in support of striking workers at the Pullman Palace Car Company in Chicago.

The action resulted in a near nationwide tie-up of the railroads and one of the most momentous episodes of labor conflict in U.S. history. However, railroad managers acting in concert discharged and blacklisted employees who refused to handle Pullman cars and persuaded the federal government to intervene with federal troops and a sweeping injunction effectively outlawing the boycott. By mid-July, the strike and boycott were over. In the bitter aftermath, Debs and other ARU leaders were convicted of civil contempt and sentenced to prison; many blacklisted strikers were unable to find railroad employment again.

The events surrounding the Pullman strike and boycott of 1894 spelled a crushing defeat for industrial unionism on North American railroads while ensuring that the brotherhoods' style of craft unionism would triumph. The Big Four not only studiously avoided the conflict, but they also expelled members who supported the boycott and assisted the railroad corporations in identifying and blacklisting strikers. In the aftermath of the conflagration, the federal government and the railroad corporations took favorable note of the brotherhoods' actions and set about including them in a state-sanctioned system of media-

tion and arbitration designed to prevent conflicts of the Pullman boycott variety and to ensure that the railroads remained free of "radical," industrial-style unionism. The Erdman Act of 1898 provided the framework for the nation's first real system of collective bargaining as well as the first, if de facto, recognition of the right of unions like the brotherhoods to exist.

War, Worsening Wages and Conditions

The Erdman Act provided the brotherhoods with a level of security and stability that enabled them to become quite powerful by the eve of the United States' entry into World War I. In the years after 1897, with the return of prosperity following the 1890s depression, running-trades workers found themselves working longer, more intensive hours as the railroads strained to meet the increased demand placed upon them by the rapidly expanding national economy. Combined with a steadily rising cost of living, deteriorating working conditions produced rank-and-file cries for higher wages and shorter hours. With pressure from below and an "opportunity structure" provided by the state from above, some brotherhood leaders recalled the lessons of their brief experiment with federation and the need for cooperation among themselves at some level.

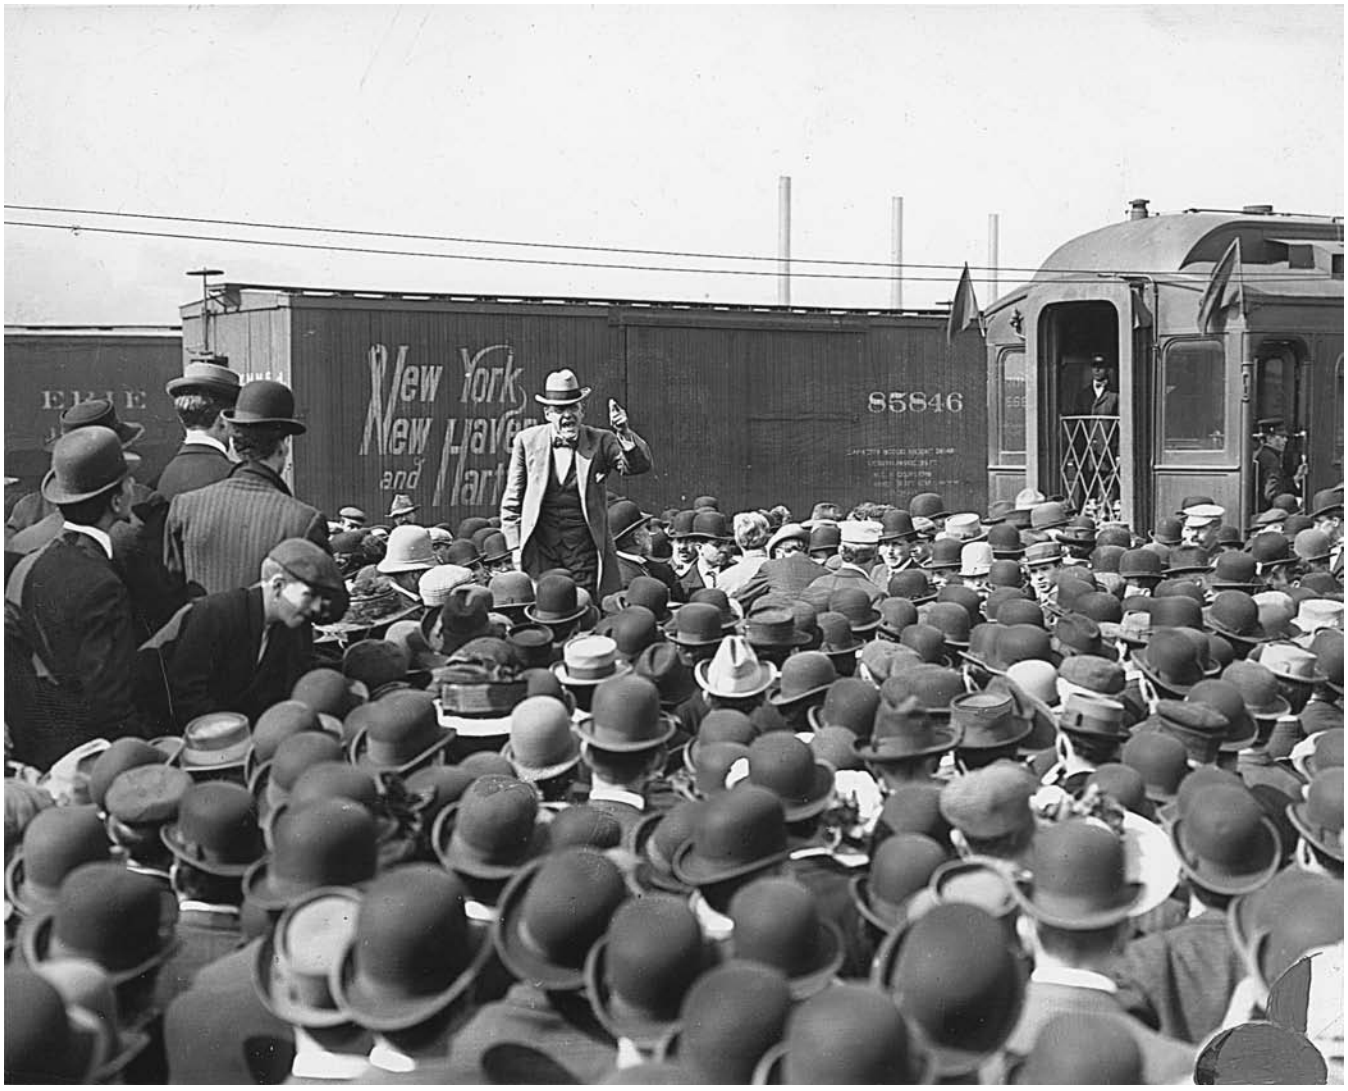
Leading the way in 1902, the Order of Railway Conductors and Brotherhood of Railroad Trainmen formed an association to present coordinated wage demands to the railroad corporations. Followed by the Brotherhood of Locomotive Engineers and Brotherhood of Locomotive Firemen and Enginemen (which amended its name in 1907, a reflection of the long-standing jurisdictional friction between the two unions), the brotherhoods engaged in a pattern of ever-widening, and increasingly synchronized, industrial action, including successive rounds of "concerted movements," as the presenting of uniform demands was termed, and mediation and arbitration under federal auspices. Although the brotherhoods became adept at the courtlike proceedings, marshalling and presenting mountains of detailed evidence, and although they won important gains, they became increasingly disappointed with the arbitrators' awards, which tended to favor the railroads, and frustrated with the arbitration system itself.

The showdown between the brotherhoods and the railroads began in March 1916 when the Big Four jointly presented demands for an eight-hour day in the train service without a corresponding reduction in wages. The brotherhoods made clear that under no circumstances would they submit the matter to arbitration. A series of negotiations with management, union meetings, and strike ballots concluded with a national-strike deadline set for Labor Day, September 4, 1916.

By the end of the summer, after a publications relations campaign on the part of both labor and capital, the two sides were hunkering down for the deadline when President Woodrow Wilson, with the nation on the verge of entry into World War I and facing the most serious tie-up of the national transportation system since the 1890s, intervened. Going before Congress, he asked for and received legislation granting the eight-hour workday. Narrowly upheld by the U.S. Supreme Court in early 1917, the Adamson Act provided the first nationally legislated eight-hour day for nongovernment workers and marked a historic shift in the federal government's ability to intervene in and regulate labor relations. It also marked the power and aggressiveness the brotherhoods had commanded and set the stage for the role these unions would play in labor politics during World War I and the 1920s.

As the United States mobilized for war during 1917, the railroads buckled under the strain of national transportation demands. The situation, which reached crisis proportions by the end of the year, had been in the making for at least a decade as the railroads, hampered by Interstate Commerce Commission caps on shipping rates and burdened by an increasing wage bill, failed to expand sufficiently. In December, the Wilson administration moved to nationalize the railroads, and for the duration of the war the federal government operated the national rail system through the United States Railroad Administration (USRA). The government's takeover, together with the wartime rhetoric of industrial democracy, had an enormous impact on railroad labor of all grades. Although the grievance and collective bargaining machinery utilized by the USRA enabled the Big Four to gain formal recognition and extend their membership, its impact on nonoperating employees was even greater.

Dating back to the late nineteenth century, a variety of unions had attempted to organize the wide range of nonoperating railroad workers. Skilled shopmen, particularly machinists, but also boilermakers, blacksmiths, and the other metal workers who built and maintained the locomotives, had organized, primarily through the Knights of Labor as early as the 1870s. With the disillusion of the KoL and the shat-



Labor leader and Socialist Eugene V. Debs ran for president five times. In 1920, he won more than 900,000 votes despite being imprisoned for violating the Espionage Act by publicly opposing World War I. *(Brown Brothers)*

tering of the ARU, however, the union that came to represent railroad machinists and that stood at the forefront of the shopcraft unions, was the International Association of Machinists (IAM). Other unions such as the International Brotherhood of Blacksmiths and International Brotherhood of Boiler Makers represented the rest of the railroad metals trades.

The militancy and tendency of the shopcraft unions to engage in joint action and to form systemwide federations, a legacy of the Knights, prompted the American Federation of Labor to inaugurate a Railway Employees' Department (RED) in 1908. After the turn of the century, unions like the Brotherhood of Railway Carmen, Brotherhood of Railway and Steamship Clerks, Brotherhood of Railway Telegraphers, and Brotherhood of Maintenance of Way Workers came into being to represent nonoperating workers in the yards, stations, communications, and track maintenance. By the World War I period, reflecting the segmented nature of the railroad labor force, some sixteen different unions represented railroad workers. All but the Big Four would affiliate with the AFL. Diverse as their membership was, one thing the nonoperating unions had in common was the fact that the industrial relations machinery put in place by the Erdman Act did not extend to them. Consequently, in the years before World War I, these unions faced an uphill battle to organize and gain recognition from the rail-

road corporations. During the war, the USRA permitted these unions to significantly extend their membership, which had consistently lagged behind that of the Big Four, win important wage gains, and sign national agreements standardizing wages and working conditions.

Racial Inequality

The workers who arguably expected the most of, and were most bitterly disappointed by, the Railroad Administration were African Americans. Since the period of slavery, Southern railways had engaged the labor of black men in the construction, maintenance, and operation of their roads. After the Civil War and emancipation, many of these workers remained in railway service, establishing a tradition of black labor, notably, in the brakemen's and firemen's positions in the South. But when it came to unionization, these men faced dual obstacles: the obstruction of railroad management and the antipathy of the railroad brotherhoods, not to mention the racial climate of the New South. Management profited from black labor, which it paid at a lower rate than white and easily ignored or beat back black attempts at organization.

White unionists, particularly the Firemen and Brakemen, for their part, not only excluded black workers from their unions but did everything they could to drive them from railroad employment entirely. From the first decade of the twentieth century well into the 1920s and 1930s, the BLFE and BRT conducted a series of often violent "race strikes," political lobbying, and outright terrorism to eliminate black brakemen and firemen from the railways. Black workers, however, refused to voluntarily give up their jobs and persisted at unionization.

Over the course of the 1910s and 1920s, black firemen, brakemen, switchmen, and Pullman porters established numerous local and regional associations, including the Colored Trainmen of America (CTA), the Colored Association of Railroad Employees, and the well-known Brotherhood of Sleeping Car Porters (BSCP), headed by Socialist journalist A. Philip Randolph. One group, the Railway Men's International Benevolent Industrial Association, led by Robert L. Mays, sought to transcend craft divisions and build a single federation of all black railroaders. During the war, these men leapt at the chance offered by the USRA to claim for themselves the rights enjoyed by their white counterparts. Because the USRA directly oversaw the nation's rail system, it provided blacks with a set of bureaucratic procedures they could follow in pursuit of their rights. But the Administration often moved slowly to make good on promised improvements and, in fact, acted against black workers when their frustration spilled over into strike action. Moreover, USRA labor relations machinery favored the established white unions, and the white unions themselves continued in their hostility to their black counterparts. Nevertheless, the World War I period and equity principles established by the USRA raised black aspirations and resulted in the persistence of black labor unions through the 1920s and 1930s, despite continued white hostility.

If the war experience was transformative for black railroaders, it also reoriented the white railroad unions toward social reform and taught them the virtues of government administration, developments that fed directly into their most ambitious political campaign: the Plumb Plan for government ownership of the national rail system. Proposed and elaborated by the brotherhoods' general counsel, Glenn E. Plumb, and progressives within the railroad unions—the Engineers' Warren S. Stone, the Machinists' William H. Johnston, and Bert Jewell of the AFL Railway Employees' Department—the Plumb Plan envisioned a tripartite rail administration drawn equally from labor, shippers, and bondholders. Coordinated by the Plumb Plan League, the campaign for the Plumb Plan reflected the rail unions' new social consciousness as well as the effect of wartime industrial democracy rhetoric, especially in the campaign's emphasis on the unions as defenders of the public interest and the Plan as a democratic way to administer the railroads.

The Railroad Labor Board and Political Action

In the context of postwar labor militancy, however, the Republican-controlled Congress was not only determined to return the railroads to private ownership, but it almost included in the bill returning the railroads to their owners a provision outlawing strikes. In the end, the Transportation Act of 1920 established the Railroad Labor Board (RLB), a quasi-judicial body itself empowered to decide labor disputes. Smacking of compulsory arbitration and inconsistent in its efforts to obtain compliance with its decisions, the RLB permitted the railroad corporations to roll back trade unionism among the nonoperating employees and introduce company unionism. The Board, then, became the target of labor antagonism. So deeply did labor's grievances run that on July 1, 1922, roughly 400,000 shopcraft and other nonoperating employees walked off the job. The first nationwide railroad strike since

1894, the Shopmen's Strike of 1922 met with employers determined to oust trade unions from their shops and a federal government with little compunction about using extraordinarily sweeping injunctions and the military to break the walkout.

Railway labor's defeats during these years spurred the railroad unions into political action. Although these organizations, especially the Big Four, had been politically active as early as the 1890s and encouraged members to vote for candidates friendly to labor, they had focused their efforts on monitoring and influencing legislation affecting railway labor. Early on, the brotherhoods had recognized that the terrain on which they operated was defined by government. Certainly, the injunctions issued against boycotts and strikes made this clear. But railwaymen also understood that in many instances it was only government that could meaningfully address crucial workplace issues. Accordingly, the brotherhoods maintained lobbyists in the state and national legislatures and, working with reform-minded activists outside the labor movement, won important safety, workmen's compensation, and hours legislation in the years before World War I. With the events of 1919–1922, the railroad unions decisively shifted into electoral politics.

Following passage of the Transportation Act in 1920, the railroad unions organized a nonpartisan campaign that defeated one of the Act's co-authors and other labor-unfriendly congressmen. In the fall of 1922, the unions founded the Conference for Progressive Political Action, an organization that quickly became the focal point for a wide range of reformers, farm leaders, and intellectuals and succeeded in electing to Congress a number of labor-friendly candidates in the off-year election. This Progressive bloc briefly flirted with the idea of a formal labor party, but the Big Four steered the movement toward independent action and in 1924 backed Wisconsin Senator Robert M. La Follette (R-WI) in his unsuccessful insurgent campaign for the presidency.

Although the rail unions failed in their goal of electing a Progressive labor-friendly candidate to the White House, their 1920s political activity set in motion events that would shape railroad labor relations in the 1930s and after. The Republicans who controlled the federal government during the decade remained in power, but they nevertheless took notice of labor's political power and dissatisfaction with the RLB. The result was the Railway Labor Act of 1926, which introduced a Board of Mediation and marked the first time Congress recognized the right of workers to join unions without employer interference.

The Act established the basic framework that would govern railroad industrial relations into the post–World War II era, with expanded provisions provided by the Amended Railway Labor Act of 1934. As the Depression of the 1930s deepened, the railroad unions used their political power to address the problem of unemployment in the industry. Thus, the unions supported full-crew, train-limit, and six-hour-day legislation. But the measure with the greatest significance was the Railroad Retirement Act of 1937, which established a separate system of social security for railroad employees. Together, these railway laws represented important New Deal industrial relations and social welfare legislation that paralleled the better-known Wagner and Social Security Acts. For the railroad unions themselves, this legislation enabled them to secure national agreements covering almost all operating and most nonoperating employees by the end of the decade.

The New Deal and World War II

The New Deal policies of the 1930s that proved favorable to organized labor on the railroads and elsewhere had a mixed effect on black railroad unions. The 1934 Railway Act rescued the Brotherhood of Sleeping Car Porters from oblivion, but the same machinery that worked to BSCP's advantage provided the standard (white) unions with a virtual monopoly over their respective job categories, effectively depriving black workers in the operating crafts of their workplace and bargaining rights. (The Congress of Industrial Organizations encountered the same obstacle when it attempted to organize nonoperating workers during the 1930s and 1940s.)

Nevertheless, unions like the Association of Colored Railway Trainmen and Locomotive Firemen persisted. Following the path blazed by their World War I-era predecessors, they translated their exclusion from the larger labor movement into a tradition of independent unionism that fostered a fierce racial solidarity and pride among black craft workers. The World War II period and the return of prosperity prompted the railroad unions to recover the ground they had lost in terms of wages during the Depression. Despite a no-strike pledge, labor militancy actually increased during the war as a number of small, wildcat strikes, usually as a result of disputes over the application of national agreements or wartime wage stabilization policies, resulted in a number of temporary government seizures of railroads. But the real la-

bor conflict of the era emerged in the years immediately following the war as both the operating and nonoperating unions presented demands for increased wages, shorter hours, and work rules revisions. All but the Engineers and Trainmen, who had grown frustrated with the tedious process of working through the Railway Labor Act machinery, settled their issues. In early 1946, the two holdouts conducted strike votes and after a series of emergency conferences walked out on May 23, initiating the first major strike of operating employees since the Burlington Strike of 1888.

Under threat by President Harry Truman, who had seized the railroads, to draft striking employees into the military, the union chiefs called off the strike after only forty-eight hours. Successive rounds of demands and presidential seizures in 1948 and 1950 completed railroad labor's part in the broader strike wave of the post–World War II era.

Black railwaymen took advantage of the war's moral climate, as a war for democracy, to fight the pervasive discrimination they faced. The March on Washington Movement of 1941, conceived by A. Philip Randolph to force the Roosevelt administration to take action against racial discrimination in defense-related industries, resulted in the creation of the Fair Employment Practices Committee (FEPC). The FEPC conducted hearings and investigations into the railroads and a number of other industries and ordered the elimination of discriminatory practices. However, it was another matter to enforce such calls. Thus, in addition to the FEPC, black railroaders turned to the courts and with civil rights lawyer Charles H. Houston won important decisions in the 1944 U.S. Supreme Court cases of *Steele v. Louisville & Nashville R.R. Co.* and *Tunstall v. Brotherhood of Locomotive Firemen and Enginemen* requiring white unions to represent fairly black workers over whom they had jurisdiction. The *Steele* and *Tunstall* decisions stood alongside the other World War II-era Supreme Court decisions that laid the groundwork for the eventual ending of legal discrimination against African Americans. In this way, writes historian Eric Arnesen, the "civil rights unionism" of black railwaymen flowed into the larger African-American civil rights movement. Nevertheless, it would not be until the 1960s and its landmark civil rights legislation that black operating employees would be able to break down the rigid color bars that blocked their advancement.

Sadly, black railwaymen achieved their greatest victories just as the railroad industry entered a period of terminal decline, continuing a trend dating from the 1920s. Competition from interstate trucking, intercity bussing, the airlines, and the automobile severely cut into the railroads' passenger and freight traffic and revenues. By 1965, only a little over a third of the U.S. rail network provided passenger service, and it was only the creation of the quasi-public Amtrak by the Rail Passenger Service Act of 1970 that kept any service available. Railroad employment dropped correspondingly, declining 32 percent between 1950 and 1960 and total jobs decreasing from 909,000 to 683,000 between 1960 and 1968. Moreover, locomotive firemen faced technological extinction as the diesel locomotive replaced steam power. From the 1950s onward, the railroad unions fought largely defensive battles, attempting to preserve jobs and maintain wages and working conditions, and, by the 1980s and 1990s, resisting White House efforts to undo social welfare legislation such as the Federal Employers Liability Act.

For the railroad unions, white and black, these difficult times manifested themselves organizationally. The operating brotherhoods, with the exception of the BLE (which followed suit in 1988), reflected the strain when they petitioned and were admitted to the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) in the 1960s. The pressure of civil rights laws and AFL-CIO admission requirements forced the brotherhoods to drop their color bars, but this contributed to the decline of the independent black railway unions. After the BRT successfully challenged the Colored Trainmen of America (CTA) as the bargaining agent of brakemen and yardmen on the Missouri Pacific Railroad, the CTA met for the final time in 1969. Similarly, the Brotherhood of Sleeping Car Porters ceased to exist when financial and organizational difficulties forced it to merge with the Brotherhood of Railway and Airline Clerks in 1978, thus ending a history of independent black unionism. But, to a large extent, independent brotherhood unionism also ended when in 1969, the BRT, BLFE, ORC, and SUNA came together to form the United Transportation Union (UTU), bringing closer than ever before Eugene V. Debs's dream of "one big union" of railroad workers, but not exactly under the circumstances he had envisioned. In 1989, the UTU attempted an expensive, but unsuccessful, bid to take over the BLE in a representation election on the Norfolk Southern Railroad.

Railroad unionism continues in the twenty-first century but in rather attenuated form compared with its earlier history. Although the railroads continue to haul much of the nation's freight, with Amtrak re-

peatedly on the brink of bankruptcy and the challenges facing the larger labor movement, railroad unions face an uncertain future. Nevertheless, the industry's complex nature and its relationship to government will continue to influence the character of railroad unionism.

Steelworkers Movement

In the approximately 125-year history of the American steel industry, steelworkers have had little success organizing lasting social movements. The most important reasons for this failure do not rest on the steelworkers themselves. External factors such as changing production technology, resistance from their employers, the nature of American labor law, and foreign competition for the firms they work in have thwarted repeated efforts by workers to bring lasting changes to this industry.

Early Steelworker Movements

Andrew Carnegie pioneered the mass production of steel in the United States during the mid-1870s. Before that time, iron fulfilled the requirements of most metal consumers. Because it took years to develop the skills needed to puddle iron (stir it in such a way as to remove impurities), iron workers exercised enormous control over the production process. This changed when Carnegie introduced the Bessemer process to America. Bessemer converters blew air through molten slag, thereby eliminating the need for hand puddling and making the mass production of steel possible. Faced with the emerging threat of technological obsolescence and the immediate threat of the Panic of 1873, local organizations of skilled puddlers organized the Amalgamated Association of Iron, Steel and Tin Workers in 1876. The Amalgamated Association believed strongly in craft unionism, meaning it had little interest in the fate of less-skilled workers.

Despite having the word "steel" in its name, the Amalgamated Association was always strongest in the ironmaking sector of the iron and steel industry. But unfortunately for iron workers, steelmaking was the wave of the future. Since Bessemer steelmaking did not require highly skilled workers, steelmakers had lower wage bills than ironmakers. Moreover, the amount of output produced at a Bessemer steel plant dwarfed that of a typical iron mill. Steel and iron were almost interchangeable, and since steel was more useful in key markets like rail manufacture, many ironmaking firms shifted to steelmaking in the 1880s and early-1890s, eliminating their union in the process. At the same time, many new steelmakers began production union-free. In this way, the steel industry pulled the rug out from under the Amalgamated Association.

Andrew Carnegie and the Homestead Strike

This does not mean that the transition from iron to steel produced no labor difficulties. There were many local disputes in America's steelmaking region during this transition. However, management invariably won these battles. The most famous of these conflicts occurred at Andrew Carnegie's Homestead Works (located just outside of Pittsburgh) in 1892. In two famous essays written in 1886, Carnegie had endorsed the idea of labor unions. He did this because his superior production technology had allowed him to pay union wages and still undersell his competitors who had to face periodic strikes. By 1892, that advantage had disappeared because of a glut in the steel market and an increase in technologically sophisticated nonunion rival firms. Therefore, Carnegie and his on-site partner, Henry Clay Frick, were determined to eliminate the Amalgamated Association from their mill once and for all.

Homestead's Amalgamated local expected negotiations for their new contract to go smoothly in 1892. Instead, Frick made demands he knew the union could not accept. Then, when the contract expired, he erected a fence around the Homestead Works to facilitate locking the union workers out. On July 6, 1892, the company brought a boatload of Pinkerton guards up the Monongahela River. Tipped off that the Pinkertons were coming to protect permanent replacement workers, the strikers and other citizens of Homestead,

Pennsylvania, met them at the dock in order to prevent them from landing. Twelve people died in the ensuing firefight, and many more were wounded. After the Pinkertons surrendered, the strikers marched them around town to be kicked and beaten by the local population. This uprising convinced the governor of Pennsylvania to send in the National Guard, which protected the permanent replacement workers who restarted operations at the mill. The Amalgamated gave up later that year since many of their members had already returned to work on a nonunion basis.

Many historians credit the Homestead Lockout with destroying trade unionism in the steel industry for the next forty-five years. In fact, technological change had already made the survival of a strong union in this industry impossible. The Amalgamated Association temporarily maintained strength in a few small sectors in this industry, such as tin plate manufacture, because the production process for these types of steel still required skill. In order to prevent the Amalgamated Association from mounting a comeback, Carnegie Steel employed a series of questionable tactics such as maintaining a blacklist of union members that it would not hire and spying on their workmen in order to weed out organizers. The rest of the industry would come to use similar tactics in order to stay union-free.

Fighting the Union—Strikes and Union Busting

The Amalgamated had some hope of revival when most of the industry consolidated as the United States Steel Corporation in 1901. The union struck U.S. Steel almost immediately, hoping that the firm would be willing to negotiate so it could concentrate on establishing itself on a firm financial footing. In doing so, the Amalgamated Association underestimated the firm's tolerance for labor organization. U.S. Steel chairman Elbert Gary, like many other steel magnates, hated trade unions. To him, they not only cost employers money in higher wages, but they violated the spirit of individual achievement that American capitalism depended upon. Therefore, rather than negotiate, U.S. Steel took advantage of the 1901 strike to eliminate the Amalgamated Association from more mills than ever before. For the next eight years, the company waged war on the few unions that remained, all of which represented workers in the few sectors of the industry that still required a skilled workforce. Other firms in the industry followed suit. By the end of 1909, the Amalgamated Association was as good as dead, party only to a few contracts with independent specialty steelmakers in the Midwest.

Although management eliminated the union from the industry, labor conditions steadily deteriorated. Wages for the few skilled workers in the industry decreased dramatically. The twelve-hour day and the long turn (a twenty-four-hour shift every two weeks) became commonplace. Steel companies came to depend upon new Eastern and Southern European immigrants to fill their ranks because few native-born Americans would accept these circumstances. These new employees tended to live in crowded slums located near the steel mills where they worked because they did not make enough money to live in better neighborhoods. Steel companies dominated the governments of many steel towns and used that power to keep union organizers away from their workers. At the same time, U.S. Steel created elaborate welfare programs to win loyalty from their most skilled employees. It offered workers subsidies to buy company stock and gave them a pension plan if they served the company long enough. The vast majority of workers, however, got very little from their employer.

Despite the absence of an effective union, steelworkers continued to attempt to organize in order to improve their labor conditions. There were major local strikes at McKees Rocks, Pennsylvania, in 1909 and at Bethlehem Steel in eastern Pennsylvania in 1910. After economic mobilization for World War I began, steelworkers tried to take advantage of the demand for labor and the need for continued production by beginning a nationwide organizing campaign. John Fitzpatrick of the Chicago Federation of Labor and ex-Industrial Workers of the World (IWW) organizer William Z. Foster, fresh from organizing Chicago packinghouse workers, started the National Committee for Organizing Iron and Steel Workers in 1918. During wartime, the Committee had great success signing up steelworkers, particularly less skilled immigrant workers, because employers did not want to risk disruptions in production when business was booming.

When the war ended, Committee leaders called on U.S. Steel Chairman Elbert Gary to open negotiations for a formal contract. Gary refused to recognize or even meet with them. Once again, other steelmakers followed U.S. Steel's lead. The National Committee wanted more time to organize, but rank-and-file

This antilabor cartoon aimed to taint the nationwide steel strike of 1919 with the specter of communism. *(Brown Brothers)*

pressure forced it to call a nationwide steel strike on September 22, 1919. The Committee's primary goals were to win union recognition and bring about the end of the twelve-hour day. Approximately 250,000 employees, about half the workforce in the industry, answered the strike call.

Because of their ideological resistance to trade unionism, steel producers were determined to fight the strike by using any means necessary. When the strike began, many firms hired replacements for as many striking workers as possible. Since the Committee tended to attract unskilled workers, it proved relatively easy to replace them. Steelmakers also inflamed racial and ethnic tensions among their workers in order to combat the strike. For example, U.S. Steel distributed handbills in Chicago that charged Italians and Eastern Europeans with trying to take jobs away from Americans. Media revelations about William Z. Foster's IWW past did not help the Committee's cause. This allowed employers to paint all the leaders of the strike as dangerous radicals.

As the weeks dragged on, more and more steelworkers went back to work without union contracts. The single worst blow to the strike came from within labor's own ranks when the Amalgamated Association told its few skilled members to return to work in December. The National Committee formally ended the strike on January 8, 1920, although production had returned to normal levels weeks before. It disbanded shortly thereafter.

National Labor Legislation and Unionization Efforts

Steelworkers remained docile throughout the 1920s and even into the Great Depression as wage cuts and layoffs shook the industry. It took the passage of the National Industrial Recovery Act (NIRA) in 1933 to bring about another union drive. The moribund Amalgamated Association remained the only union in the iron and steel industry at this time. Still wedded to craft unionism, its deeply conservative leadership felt no need to mount a new organizing campaign, even though Section 7(a) of the NIRA formally recognized the right of labor to organize for the first time. Unlike the United Mine Workers (UMW), which made much of the NIRA, the Amalgamated Association sent only a few organizers into the field after its passage.

Yet steelworkers did not require help from the Amalgamated Association in order to organize. In the months following passage of the NIRA, independent employee organizations sprang up on their own throughout the industry. The names of these locals (one was called the Franklin D. Roosevelt lodge; another the ARIN lodge—ARIN is NIRA spelled backwards) underscore the reason for their existence. As they had done before, steelmakers fought these organizations bitterly. Some firms created company unions (worker organizations started and dominated by management) in order to steal the thunder of reform from outside organizations; others simply refused to bargain with any union. Therefore, the majority of these new worker organizations proved short-lived.

The Steelworkers Organizing Committee

It took new legislation, the National Labor Relations Act of 1935, and a new organizing philosophy, to bring real change to the industry's labor relations. John L. Lewis of the UMW started the Committee for Industrial Organization (later the Congress of Industrial Organizations or CIO) in 1935. Although interested in organizing less-skilled workers in many mass production industries, the CIO was particularly interested in organizing steelworkers because many steel

companies controlled mines that supplied their mills. The CIO started the Steel Workers Organizing Committee (SWOC) in 1936. It began by concentrating its efforts on winning over workers involved in the company unions at U.S. Steel. By encouraging these organizations to defy management, SWOC hoped to convince the rank-and-file that only outside unions could truly represent their interests. The success of these efforts led to secret talks between John L. Lewis and U.S. Steel chairman Myron Taylor. These talks culminated in U.S. Steel's March 1937 decision to sign a contract with SWOC so as to avoid a costly strike and possible involvement by the federal government. Many other steel firms followed suit.

U.S. Steel's main competitors, such as Bethlehem Steel and Republic Steel, did not, however. These leading firms in the industry were known collectively as "Little Steel" because they were smaller than U.S. Steel Corporation, but they were all very large enterprises. Unlike U.S. Steel, which had new blood in its management ranks by the 1930s, the leaders of Little Steel continued to oppose the presence of any outside union in their plants. Therefore, when SWOC began to organize their workers in the spring of 1937, Little Steel chose to fight.

The most famous incident of the Little Steel Strike is known as the "Memorial Day Massacre." It occurred on May 30, Memorial Day, outside a Republic Steel plant in Chicago. Chicago policemen shot into a crowd of strikers, killing ten, seven of whom were shot in the back. SWOC did not get a single union contract from the Little Steel strike. However, pressure from the Roosevelt administration to keep production going during World War II led each Little Steel firm to recognize the union. By the end of the war, SWOC's successor organization, the United Steelworkers of America (USWA), represented the vast majority of workers in the industry.

Nevertheless, many steel firms only bargained with the USWA under duress. The government's National War Labor Board had forced them to do so to guarantee steel for the war effort. Because of this and other assistance from the Roosevelt administration, USWA membership grew rapidly during the war. After the war ended, the USWA had grown too large to destroy. Management attempts to roll back union power led to industrywide strikes in 1946, 1949, 1952, 1956, and 1959. The last of these strikes lasted 116 days and was the largest single strike in American history. In these disputes, the USWA invariably sought higher wages and more control over the production process. The union usually won the first issue and lost the second. By 1960, steelworkers were among the best-paid workers in all of American industry, but they were also vulnerable to technological unemployment and changing economic fortunes.

Global and Regional Competition and Steel Mill Closures

The downturn that has destroyed the potential for lasting social movements in the American steel industry began in the mid-1960s. Continuous labor tension, high wage bills, and the failure of American steelmakers to modernize their production methods led steel consumers to increasingly buy cheaper product from overseas. The USWA responded to the industry's economic crisis by promoting conciliation. For ten years, starting in 1973, it even forfeited the right to strike (in favor of mandatory arbitration) under a novel arrangement called the Experimental Negotiating Agreement.

As old mills stopped operations around Pittsburgh, Youngstown, Chicago, and elsewhere, some employees organized protests, but this did not change their fate. By the mid-1980s, the union broke pattern bargaining and fought austerity measures at surviving firms like U.S. Steel (by then known as USX Corporation because it had bought two oil companies and did not want to be primarily identified with a failing industry). Like its forerunner Carnegie Steel did in 1892, USX locked out the union in 1986. Although the USWA has survived in some mills (including those of USX), unionization rates in American steelmaking continue to decline with the industry's fortunes.

Since 1980, the only new steel mills built in the United States have been mini-mills, small-scale operations that recycle scrap steel rather than create new product from scratch. Since mini-mills require few skilled workers, they tend to operate on a nonunion basis. Furthermore, because of recent technological innovations, mini-mills have increasingly started competing with traditional unionized steel producers.

Foreign competition, nonunion mini-mills, and an unfavorable political climate for organized labor in general have all hurt the prospects for further unionization in the steel industry in recent years. After mergers with other unions, most notably the United Rubber Workers in 1995, the United Steelworkers of

America has increasingly devoted more of its attention to organizing and serving different kinds of workers. The acceleration of the American steel industry's decline during the late-1990s has only strengthened this tendency. As long as the steel industry stays on its knees, the possibility of new social movements among American steelworkers will remain remote.

Garment Workers Movement

In the 1970s, the International Ladies' Garment Workers' Union (ILGWU) pioneered the path of reintegrating labor with other social movements to bring about a more equitable society for all working people. Under new radical leadership, the ILGWU recognized that organizing women and the documented and undocumented immigrant workforce was a priority. This stance represented a marked detour from the majority view of organized labor, which argued that it was not possible to organize the undocumented. The new ILGWU leadership contended that labor–management accords represented a dead end for union building and instead, the rank-and-file had to be involved in building their own union. Through this involvement, workers would gain political understanding of the ongoing class struggle between labor and management and develop bold campaigns and labor–community coalitions. This new approach marked a radical departure from the past conservative ILGWU.

Background

Since its inception in 1900, the ILGWU had a history replete with internal political strife. On the one side were the more moderate to conservative groups, who sought industry stability and accords with management to promote the union. The opposition represented Communists, Socialists, and other radicals, who argued that the best way to build the union was through rank-and-file involvement in militant actions, such as strikes and labor–community coalitions. The moderate to conservative group held leadership well into the twentieth century. David Dubinsky, an Eastern European Jewish immigrant, who represented labor–management cooperation, was president from 1932 to his retirement in 1966. The union was organized by craft in that there were separate locals for each craft, but it also was industrial in that all branches of the industry were organized. For the majority of its history, with the exception of a brief affiliation with the more democratic and radical Congress of Industrial Organization (CIO) in 1937, the union was affiliated with the more conservative American Federation of Labor (AFL) since 1940.

Throughout its history, the ILGWU was challenged by an industry that was mainly decentralized and based on piecework. In addition, the industry was replete with small shops or sweatshops, owned by contractors who were able to offer low job bids by continually cutting labor costs. Coined in the late nineteenth century, "sweatshop" referred to a workplace where relatively unskilled workers, usually immigrants, labored or sweated for meager pay in unhealthy and unsafe conditions for many hours. Throughout the years, the industry practiced many unfair labor practices such as minimum wage and overtime violations, homework, and child labor.

In the late 1970s, faced with a declining industry, the reappearance of sweatshops, and a shrinking workforce due to the domestic effects of globalization, the ILGWU, under more radical leadership, pioneered creative and aggressive organizing campaigns, which targeted immigrant workers, including the undocumented. They were one of the first unions to recognize that the inclusion of undocumented workers was essential for the success of organizing campaigns. During this time, many organizers received their training within the ILGWU and went on to develop bold campaigns in other unions which involved undocumented workers, such as the Hotel Employees and Restaurant Employees Union and the Service Employees International Union.

In 1995, the ILGWU merged with the Textile Workers Union and the Amalgamated Clothing and Textile Workers Union to form the 300,000-member Union of Needletrades, Industrial and Textile Employees (UNITE) in an effort to strengthen its declining union. UNITE emerged as one of the most

ROSE (RACHEL) SCHNEIDERMAN
(1884–1972)

Born in Savin, Poland, on April 6, 1882, Rachel Schneiderman immigrated to the United States in 1890. She later changed her name to Rose. She went to work in her early teens sewing caps, and in 1903, she helped organize a New York City local of the Jewish Socialist United Cloth Hat and Cap Makers' Union, taking the lead in getting women elected to the union. In 1904, she was elected to the union's executive board, the highest position yet held by a woman in any American labor organization. The following year she joined the Women's Trade Union League (WTUL), the national organization that led the fight to improve women's working conditions. She remained among the WTUL's most active leaders for forty-five years, serving as president from 1926 to 1950. She was also a national organizer for the International Ladies' Garment Workers' Union (ILGWU).

Schneiderman took a major role in several of the landmark events of the American labor struggle. In 1909, she called for the strike of women shirtwaistmakers. That same year, she took a role in organizing the garment workers, and she denounced all those who had contributed to the disastrous Triangle Shirtwaist Company fire in 1911. By the late 1910s, the WTUL was her major focus. As president of both the New York and national WTUL, she concentrated her efforts on lobbying for minimum wage and eight-hour-day legislation. In addition to her work with the WTUL, she worked for women's right to vote, serving as a key organizer for the National American Woman Suffrage Association.

In 1921, she helped organize the Bryn Mawr Summer School for Women Workers. In 1922, Eleanor Roosevelt joined the WTUL, and the two women began a lifelong friendship. Schneiderman tutored Roosevelt on the issues confronting women workers, the challenges facing the trade union movement, and the problems inherent in labor–management relations. The connection paid off later when President Franklin D. Roosevelt appointed Schneiderman to the Labor Advisory Board of the National Recovery Administration in 1933, on which she served for two years, the only woman to do so. She then served as secretary of the New York State Department of Labor from 1937 to 1943. She lectured widely before diverse audiences and served on various boards. When she died on August 11, 1972, she was one of the most respected spokespersons and activists for improving the conditions of laboring people.

James G. Lewis

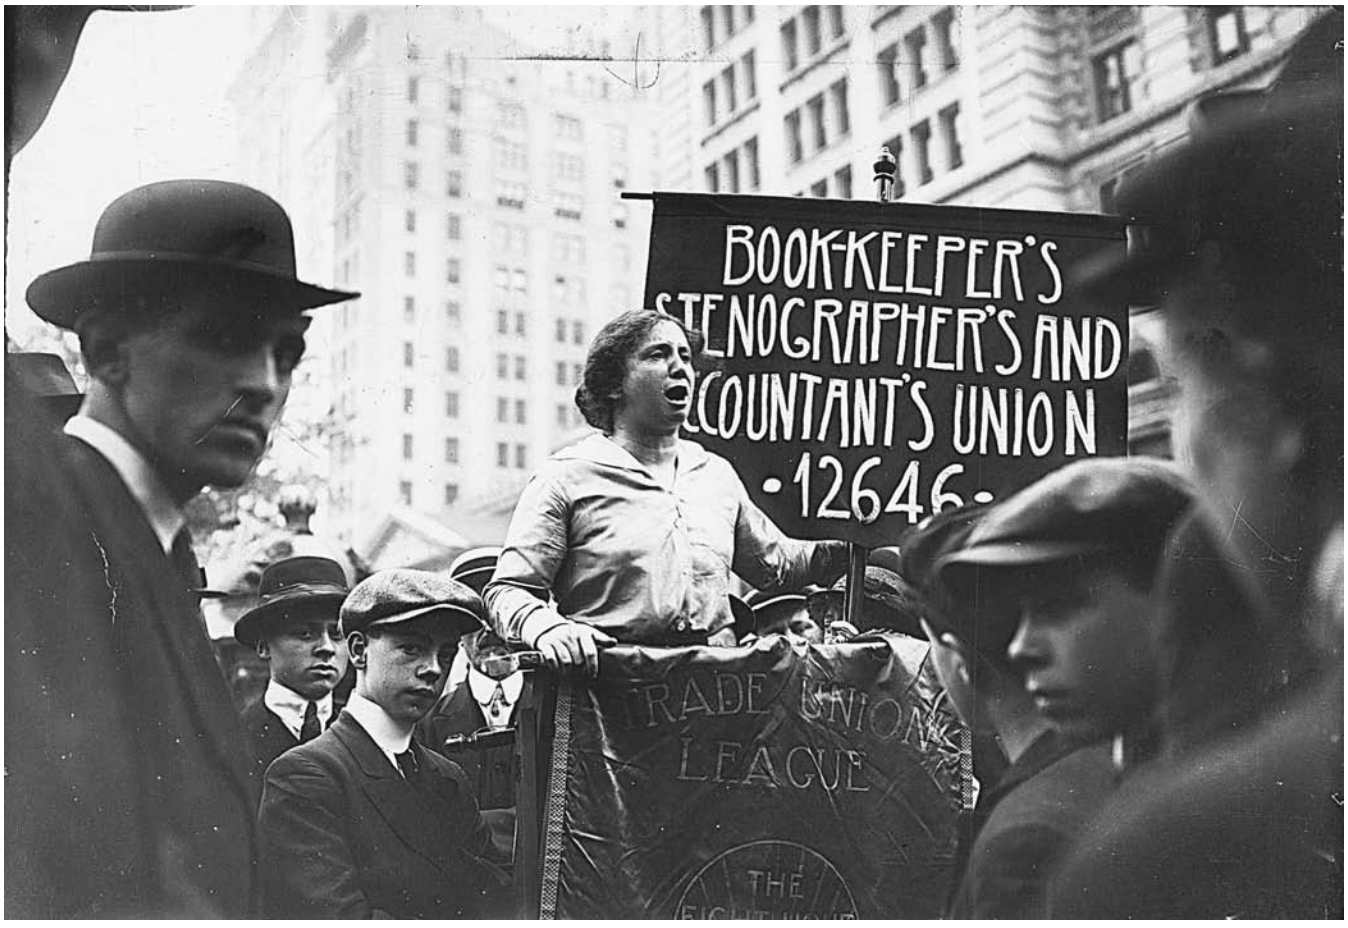
innovative and progressive unions in the nation. UNITE built labor–community coalitions, spearheaded efforts to establish and enforce federal guidelines against sweatshops, exposed slave labor conditions among Thai undocumented workers in Southern California, worked for amnesty for undocumented workers, publicized the past and present conditions in the garment industry in cooperation with a Smithsonian Institute traveling exhibit, and aggressively organized garment workers throughout the United States.

The Industry and the Union

The International Ladies' Garment Workers' Union (ILGWU) was founded on June 3, 1900, by eleven male delegates representing 2,000 workers from four unions, although immigrant women were the predominant workforce. The first industrywide strike in 1909–1910, in New York City, was led by these immigrant women workers. Shirtwaist workers fought for better conditions and higher pay in the "Uprising of the 20,000," as it was called.

In the garment industry, a hierarchy existed with men at the top of the pay scale working as cutters and pressers and women at the bottom as helpers, finishers, and sewing machine operators. Pay scales were based on piecework, and the more skilled positions paid a higher rate. The industry consisted of large manufacturing concerns in which the entire manufacturing process took place and smaller shops were run by contractors, who bid on parts of the manufacturing process. Contractors fiercely competed for jobs by keeping labor costs low, in order to win bids for work. Because of the small capital investment required, a contractor could be a former worker, who operated out of a storefront or even his own home. These shops were often mobile, and some employed family members and friends, making organizing difficult. In the late twentieth century, the union recognized the potential alliance between contractors and workers against the large manufacturers and sought to neutralize them or win their support.

In the early twentieth century, Eastern European Jewish and Italian immigrants made up the workforce, whereas by the later twentieth century, Asian and Latino immigrants constituted the main workforce. In the latter era, the entrenched leaders had little awareness of the demographic changes that had occurred within the workforce, did not speak the workers' languages, and were not receptive to their needs. They maintained their mistaken views



Rose Schneiderman, longtime leader of the Women's Trade Union League, delivers an address at a rally in Madison Square Park in New York City, circa 1913. *(Brown Brothers)*

that neither women nor immigrants could be organized.

Conditions in the garment industry were miserable. New York City was the number one garment manufacturing site in the United States. Most factory laws required 250 cubic feet of air for each worker but did not say where it had to be located. In new loft buildings, the ceilings were quite high, so owners could crowd more workers into a given space. It was sweltering hot in summer and freezing in winter. Windows were nailed shut and doors were locked under the pretense of forestalling theft. Bathrooms were filthy or nonexistent. Safety conditions were deplorable, especially the constant threat of fire. Workers labored fifty-six to fifty-nine hours a week and were charged for needles, thread, use of electricity, the stools they sat on, and the water they drank; they were fined for mistakes, as well as for talking or singing.

The Uprising of 20,000

In 1909, New York City shirtwaist workers led by Clara Lemlich, a young Jewish immigrant, began to challenge these terrible conditions by organizing ILGWU Local 25, the shirtwaist local. At that time, shirtwaists were practically the uniform for working women, and hundreds of large and small shops competed by driving labor costs as low as possible. Many unions, believing women to be nonorganizable, were reluctant to recruit them, despite the militant history of women workers, such as the Lowell women textile workers in the early to mid-nineteenth century. As conditions worsened, the Local, numbering 100 workers, pushed the International leaders to sanction a strike and began walking out of the shops. Within days, 20,000 workers were out, and more joined, until the numbers swelled to 30,000, which represented 75 percent of the workforce. Although the women strik-

With signs and flags, this picture captures the spirit, diversity, and patriotism of immigrant workers employed in New York City's garment industry in the early 1900s. *(Brown Brothers)*

ers were brutally beaten by police and thugs and jailed repeatedly, they held firm to their cause. The strikers actually received more support and publicity from affluent women of the Women's Trade Union League than they did from their own International and the AFL.

By February 1910, the strike was settled with the majority of workers being rehired, hours reduced to fifty-two with a two-hour limit on night work, and wages increased 15 percent. But the settlement also included the Protocols of Peace, which were pacts to settle conflicts without strikes and supposed to serve as a model of labor–management cooperation. The Protocols were in sharp contrast to a more radical trade union philosophy, which viewed strikes as the workers' most effective weapon. The controversial no-strike provision later fueled disputes in the union.

A total of 345 firms signed contracts with the union, membership grew to 60,000, and Local 25's membership rose to 10,000. The significance of the 1909–1910 strike was that it was the first industry-wide strike and was led by immigrant women. Although the strike clearly disputed the male leadership's position that women and immigrants could not be organized or maintain a fierce strike, male

PAULINE NEWMAN (c. 1890–1986)

Pauline Newman was born in Lithuania around 1890 and came to the United States in 1901. Soon after her arrival in New York City, she went to work to help support her family working in a hairbrush factory and hand-rolling cigarettes. As a young teenager, she became employed at the Triangle Shirtwaist Factory trimming extra threads off of shirts. Working seven days a week, often for fourteen hours a day, she made a dollar and a half a week. She was no longer employed there by the time of the tragic fire in 1911.

Newman took to radical politics early and spent most of her career with the International Ladies' Garment Workers' Union (ILGWU), an organization dominated by Eastern European Jewish men. She balanced this loyalty with participation in the emerging arena of women-centered politics led by the Women's Trade Union League (WTUL). This coalition of wage-earning and middle-class women fought for the eight-hour day, decent wages, women's suffrage, and protective workplace laws. The tragic death of nearly 150 women in the 1911 Triangle Shirtwaist Factory fire galvanized the ILGWU, which pushed harder for improved working conditions. New York's state legislature imposed tougher municipal building codes and more stringent factory inspections.

A leader in the ILGWU, Newman became the first full-time woman organizer. She had her initiation into the labor movement as a speaker in the 1909 Shirtwaist Makers Strike and went on to become an organizer in the Northeast and Midwest, playing a role in numerous major strikes. She founded the ILGWU's Health Center and was director of health education from 1918 to 1980. Newman's other positions over the years included adviser to the United States Department of Labor in the 1930s and 1940s, the Board of Directors for the Bryn Mawr Summer School for Women Workers, and the WTUL. She died in Manhattan on April 8, 1986.

James G. Lewis

leaders still refused to relinquish their mistaken beliefs.

The Triangle Shirtwaist Company Fire

Although the Triangle Shirtwaist Company workers had been among the most militant and courageous leaders of the strike, the company was not one of the 345 firms that recognized the union. The Triangle Shirtwaist Company was located on the top three floors of a ten-year-old building, acclaimed to be fireproof. One of the key demands in the 1909–1910 garment strike had been for adequate fire protection, including fire escapes and sprinkler systems. The exterior was brick, but the interior was flammable wood. There were inadequate fire escapes and no sprinkler system. All doors opened inward, and all but one door to the staircases were kept locked, based on the employer's premise that this would prevent employee theft. Oil-soaked rags littered the floors; barrels of oil were lined up against the walls; piles of cloth, rags, and tissue were everywhere; and lint was heavy in the air.

On March 25, 1911, as 500 workers were preparing to leave at 4:30 P.M., a fire broke out on the eighth floor, and within minutes the "fireproof" building was engulfed in flames. Many were crushed trying to escape, and others jumped to their death 100 feet below. A total of 146 workers perished, all but 21 of whom were women. The owners were eventually acquitted of manslaughter charges, which incensed workers and their allies, who demanded an investigation. Based on the findings, fifty-six state labor laws were passed relating to safety and child labor. This hard-fought-for legislation served both as an example for other states to follow suit and as a model for the 1930s New Deal legislation.

Political Disputes Within the Union

In the following decades, the union leadership continued to play a conservative role by making industry stability a priority over workers' needs and involvement. The labor–management accord continued to characterize the union activities and philosophy into the late 1960s and early 1970s. The hierarchical structure of the industry was replicated within the union, as women were not groomed for union leadership, which remained steadfastly male. The New York headquarters continued to have bitter political disputes involving Communists and Socialists who opposed this approach. Political disputes in Los Angeles were similar to those in New York and other parts of the country, but in Los Angeles popular leftists won leadership of a number of locals.

ILGWU in Los Angeles

In Los Angeles, the industry followed similar patterns to those in New York City. After a militant strike in

Aftermath of the Triangle Shirtwaist Company fire of March 25, 1911, in which 146 workers died, many of them young women who, unable to escape, plunged to their deaths to the streets below. One of the worst industrial accidents in American history, the tragedy led to the passage of stringent fire safety laws. *(Brown Brothers)*

1919, ILGWU Local 52 made its presence felt within the burgeoning Los Angeles garment industry. By 1924, Los Angeles was the United States' fourth leading garment manufacturing center. One of the few women in ILGWU leadership, Vice President Molly Friedman, criticized the union for not actively recruiting the 3,000 mainly Jewish and Latina women workers. Friedman's organizing plan did not take effect until 1933 when Rose Pesotta, an ILGWU organizer, was allowed to undertake a major campaign in Los Angeles. Her 1933 successes enabled Pesotta to convince the International leadership to back an even more impressive organizing effort in 1941 against the formidable Mode of Day Company.

The Cold War Era

The Cold War era led to a fierce red-baiting campaign in many areas of U.S. society, including the trade union movement. Many union leaders were intent on ousting leftists and militants from key positions. The ILGWU was no exception. All officers within the trade unions were to sign a non-Communist disclaimer affidavit as part of the 1947 Taft-Hartley Law. Those who refused were to be removed from office in order for the union to receive certification from the National Labor Relations Board. The ILGWU leadership began a campaign to ensure that all officers sign the affidavit or resign. By 1950, the leadership had successfully removed all radical threats to its position throughout the union, including those in Los Angeles.

Globalization of Garment Production

The 1960s to the 1980s were marked by increasing globalization as companies moved offshore to escape unionization, higher wages, and better benefits. By the late 1980s and early 1990s, owing to political instability in many of these countries, the garment industry began to bring the Third World home by providing jobs for undocumented workers and recreating the sweatshops of the nineteenth and early twentieth centuries. The most shocking and extreme situation occurred in 1995 in El Monte, California, when seventy-two Thai garment workers were discovered locked up in virtual slavery. These workers, defended by the Asian Pacific Legal Center and the union, later won millions of dollars in back wages. Large retailers such as Bloomingdale's, Nordstrom, Neiman-Marcus, and Disney were found to have sold clothes made by these workers.

By the early 1990s, 4,500 of Los Angeles's 5,000 garment shops were sweatshops; 2,000 of New York's 6,000 garment shops were sweatshops; and scores of others existed throughout the United States. These companies, contractors for the giant retailers and manufacturers, such as Guess, flagrantly violated labor laws involving minimum wage, overtime, and industrial homework, cheating workers out of hundreds of thousands of dollars. During the Clinton administration, Secretary of Labor Robert Reich found that violations of minimum wage and overtime laws were pervasive throughout the garment industry.

Since sweatshops were difficult to organize, and many garment industries had moved offshore, ILGWU membership declined from 457,517 to 125,000 by 1995. In 1995, the ILGWU joined with two other garment workers unions to form the Union of Needletrades Industrial and Textile Employees (UNITE). The new union, considerably strengthened with 300,000 members and with a newly elected militant and progressive leadership, went on to become a leader in innovative and bold organizing efforts. UNITE spearheaded many campaigns to enlist federal legislation and enforcement against sweatshop and garment industry labor law violations.

In 1996, 128 of the nation's largest retailers and manufacturers signed an agreement to comply with existing labor laws and to permit federal monitoring of domestic and offshore factories. Investigations revealed that some of the biggest names in entertainment and fashion were involved in contracting out their products to domestic sweatshops employing undocumented workers, including children. In addition, these same personalities were indirectly involved in offshore sweatshop production. Some embarrassedly joined public efforts to eradicate global sweatshop labor, but others were recalcitrant in their refusal to acknowledge their culpability in endorsing such products. UNITE, working with young socially aware entertainers, such as Rage Against the Machine, publicized the injustices in the garment industry. The union set up a special Sweatshop Watch unit to publicize the conditions in the garment industry in order to help pass state and federal legislation that would force retailers and manufacturers to comply with existing labor laws and to outlaw sweatshops.

Common Threads

Reminiscent of the Women's Trade Union League, Common Threads was developed by professional women to publicize both sweatshop abuse and the relationship between garment workers and consumers. Working with UNITE, Common Threads developed successful campaigns against giants such as Guess, which led to a federal investigation and efforts to promote stricter guidelines regarding garment employment. Based on a grant from the California Council for the Humanities and UNITE, Common Threads installed nine storefront depictions of the history of the garment industry and union and offered tours and lectures of key moments in the union's history. The exhibit remained in place for one year, despite the strong opposition of the fashion and apparel industries.

The Smithsonian Institution Sweatshop Exhibit

In 1997, the Smithsonian Institution, in conjunction with a grant from UNITE and the National Retail Federation, documented the history of American sweatshops from 1820 to 1997. The exhibit was scheduled to travel throughout the United States, but the powerful retailers' and manufacturers' associations lobbied so hard against it that museums refused to allow it to be installed. One exception was the Museum of Tolerance in Los Angeles, which, despite threats of funding loss, courageously provided a home for the traveling exhibit.

teamX

In a unique move to illustrate how sweat-free conditions can produce quality garments, teamX Inc., a Los Angeles-based employee-owned manufacturer was created in 2001. teamX is fully represented by UNITE

and is modeled upon the highly successful Mondragon Industrial Cooperative in the Basque Region of Spain. teamX's labor–management and manufacturing system is in the forefront of the garment industry. Their line of clothing, SweatX, is geared to the college market. Students and professors have organized campaigns at their campuses to ensure that their student stores purchase solely union-made garments, such as SweatX.

Conclusion

From its inception until the 1970s, the ILGWU was controlled by a leadership that promoted industry stability and labor–management accord. However, a more radical faction consistently argued against this philosophy and for rank-and-file involvement to increase workers' understanding of class struggle. In the 1980s, faced with decreasing membership and the reappearance of sweatshops, a more radical ILGWU leadership pioneered creative and bold organizing campaigns, which set an example for the entire labor movement. One of the key elements in their philosophy was the necessity to organize documented and undocumented immigrant workers.

In 1995, the ILGWU merged with two other unions to form the 300,000-member UNITE, emerging as one of the most progressive unions in the United States. UNITE built labor–community coalitions, spearheaded efforts to outlaw sweatshops, sponsored a worker-owned garment collective, fought for immigrant amnesty, and continued to creatively organize workers throughout the United States. Through its efforts, UNITE linked labor with other social movements for positive social change, bringing more equity within the United States.

LABOR MOVEMENT 1920–1934

The 1920s were dark days for the American labor movement. The decade began as the strike wave of 1919 was brutally suppressed and many local unions were effectively shattered. The Palmer Raids of the following year further stigmatized organized labor with the taint of radicalism and anarchism. Throughout the decade, seemingly every major institution of American life—the police, the courts, the federal government—allied to keep the "Open Shop" free from unionization. During the decade, union membership fell almost a third, from just over 5 million members in 1920 to 3.4 million in 1929. Whereas 19.4 percent of nonagricultural workers were union members at the start of the decade, just 10.2 percent were unionized in 1929. The number of strikes plummeted from 3,630 in 1919 to just 921 in 1929. Those contemporary observers who paid much attention to organized labor deemed it largely irrelevant. As President Calvin Coolidge observed in a January 1924 speech before the American Society of Newspaper Editors, "The chief business of America is business."

The pro-business, staunch individualist outlook was shared by all three Republican presidents during the decade and by many workers as well. Indeed, given the material advances during the decade, there was ample reason for optimism in the American working class. Between 1923 and 1928, average yearly wages increased 9.1 percent, from $1,285 to $1,405. The total annual amount paid in wages and salaries climbed from $36.4 billion in 1922 to $57.4 billion in 1929. To be sure, the increase paled in comparison to the climb in dividends, which more than doubled in the same period, from $3 billion to $6.3 billion. Although real wages inched up just 2 percent during the decade, more American workers were participating in the consumer economy thanks to the rapid spread of the installment plan. Although car and home ownership were still beyond the reach of many workers, radios, refrigerators, and other appliances became more commonplace in workers' homes in the 1920s. "Working men don't need unions nowadays," one Muncie, Indiana, businessman told Robert and Helen Merrell Lynd in their classic study of 1920s America, *Middletown: A Study in Modern American Culture*, adding, "We are much more in danger of coddling the working men than abusing them. Working people are just as well off now as they can possibly be except for things which are in the nature of industry and cannot be helped."

TRENDS IN MANUFACTURING JOBS AND EMPLOYMENT

The economic expansion of the 1920s owed much to the advances in productivity that transformed the American workplace in the first part of the century. As it had since the antebellum era, industrialization after the turn of the century emphasized machine production, technological advances, and unskilled labor in manufacturing goods; however, manufacturing work after 1900 was increasingly directed toward the making of durable goods for the consumer market. The most obvious symbol of the new consumer age in manufacturing was also its dynamic sector: the automobile industry. Nothing demonstrated the changing nature of manufacturing jobs in the twentieth century better than the assembly-line production at Henry Ford's Highland Park plant, opened in the Detroit suburb in 1909 to produce the Model T.

CONSUMERISM

Ford's factory put into practice the scientific management principles of Frederick Winslow Taylor, the most influential industrial engineer of the early twentieth century. Taylor preached simplification, routinization, and deskilling in the workplace. The use of standardized and interchangeable parts further increased worker productivity, as did the introduction of the as-

sembly line. For workers, the assembly line represented not just technological innovation, but dehumanization as well: the exhausting pace of work led to a 380-percent turnover at Highland Park by 1913. To counter the problem, Ford announced a Five Dollar Day—actually, a base rate of $2.34 with additional incentive pay—to keep workers at the helm. Thousands stormed Ford's employment office in the wake of the announcement, and other automobile manufacturers were forced to follow suit. The establishment of high wage rates in the industry allowed autoworkers to begin participating in the mass consumer economy of the 1920s. Yet the wages of the auto industry did not become the norm across the economy. One survey showed that 47 percent of Ford workers owned cars in the 1920s, while just 26 percent of workers in San Francisco and 3 percent of unskilled Chicago laborers could make a similar claim.

Unemployment

As a result of these trends, productivity in the 1920s increased 72 percent in the manufacturing sector, 41 percent in mining, and 33 percent among the nation's railroad lines. Despite these impressive statistics, in the eyes of many employers, workers remained as interchangeable as the parts they installed on the assembly line. Since no federal agency collected unemployment figures until legislation directed the Bureau of Labor Statistics to do so in July 1930, estimates of jobless workers varied widely. Some social scientists calculated that unemployment never dipped below 10 percent, even during the economic expansion of 1923 to early 1929. Even optimistic observers admitted that the jobless rate stayed well above 5 percent during the decade, even during the boom years. More accurate studies were conducted by local observers and give a more revealing snapshot of the era. A Wharton School survey in April 1929 found that 10.4 percent of Philadelphia's workers were out of a job. But a simple measure of joblessness in itself could be misleading. A 1929 survey conducted in Buffalo, New York, showed that the city had a jobless rate of 10 percent, with another 6.5 percent of respondents working only part-time. Most telling of all, the Lynds' study of Muncie, Illinois, revealed that only 38 percent of wage earners in working-class families had steady work during a nine-month survey period in 1924.

Labor in the Wake of the Great War

In contrast to the erratic nature of the 1920s economy, American workers had enjoyed boom times during World War I. The turbulence in Europe interrupted immigration and led to a labor shortage. With orders for war materiel pouring in, employers had little choice but to raise wages. Workers also took the incentive to join labor unions during the war; for many unskilled workers, it was their first experience with organized labor, which had traditionally been confined to the ranks of craft unions. Between 1914 and 1918, membership in the American Federation of Labor (AFL) expanded from 2 million to 3.2 million.

End of the Progressive Era

This massive wave of organizing took place with substantial support from the federal government, which marked a significant policy shift from preceding generations. President William Howard Taft—later a notoriously antilabor Supreme Court chief justice—approved the creation of the Department of Labor during the lame-duck days of his administration in March 1913. Under President Woodrow Wilson, the Department expanded its scope to include a special mediation commission to craft wartime labor policies. The committee recommended that workers have the right to bargain collectively through independent labor unions; that the government set up a grievance board to mediate disputes between management and labor; and that the eight-hour day become standardized, with overtime pay beyond eight hours.

In April 1918, the War Labor Board (WLB)—with five representatives from labor's ranks, five from the employer's ranks, and two government officials—was established to implement these policies. By the end of World War I in November 1918, the WLB had mediated 1,100 labor disputes. Under the WLB, the federal government had reached into industrial affairs on an unprecedented scale. In mandating that employers pay overtime and recognize independent labor unions under collective bargaining agreements, the WLB was the pinnacle of Progressive Era labor reforms.

Events at war's end demonstrated just how fragile these gains were; indeed, the labor movement would have to wait another generation for the federal government to become permanently enmeshed in labor relations. Most employers had fought against the WLB's agenda from the start and commenced a new round of attacks on the agency after the Armistice. Among their charges were complaints that the WLB's presence in industrial relations had fostered unnecessary agitation among labor's ranks. Employers had enjoyed the federal government's support in labor disputes almost without exception up to the war, and they demanded a return to the pre-Progressive Era status quo. After lobbying by the National Manufac-

During the strike wave of 1919, Philadelphia police club demonstrators. Labor conflicts often provoked state-sponsored violence in the late nineteenth and early twentieth centuries. *(Brown Brothers)*

turers Association, the National Metal Trades Association, and other employers' groups, the WLB was disbanded by the end of 1918. Contrary to the business lobbyists' claims, the disappearance of the WLB did everything but bring calm to industrial relations. By the end of 1919, some 4.1 million workers took part in 3,630 strikes.

The 1919 Strike Wave

One of the largest strikes took place in Seattle, where shipyard workers walked off the job in January 1919. Within two weeks, about 25,000 other Seattle workers pledged their support in a general strike. From February 6 to 11, 1919, a General Strike Committee operated community kitchens, safety patrols, and other basic services, essentially running the city on the strikers' terms. Outraged local business leaders demanded state and federal intervention, by military force if necessary. Fortunately, federal mediators finally ended the strike without violence, although the initial demands of the shipyard workers were never resolved.

The peaceful end to the Seattle General Strike was an exception in one of the most violent years in American history. Typical of the unrest was the strike at the Willys-Overland automobile operations in Toledo, Ohio. Confronting a postwar slump, the city's largest employer announced wage cuts early in 1919 that threatened to take away much of the wage gains made during the war. On May 5, 1919, more than half of the workforce walked out of the company's main plant, and the strike quickly spread to some of the city's other major factories. Willys-Overland management immediately got an injunction to limit picketing around the plant, and the business community banded together through the Merchants and Manufacturers Association. Typical of the Association's propaganda was a full-page advertisement in the May 9 edition of the *Toledo Blade* that declared, "We believe the great majority of these men and women, who have been forced out of employment are not in sympathy with the radical arbitrary demands of their self-appointed leaders . . . The vast majority of Toledoans are loyal, fair, and square. They will not stand for injustices, violence, disloyalty, or Bolshevism." In support of the injunction, the mayor deputized dozens of U.S. Army troops awaiting demobilization as deputy-soldiers to patrol the streets. After a deputy-soldier started an argument with local residents on June 4, a squadron of troops stormed into one neighborhood to put down an incipient riot. As the crowd fled, two were shot dead and nineteen others were injured by the soldiers. The strike dissipated in the wake of the

violence, and unions for production workers at the Willys-Overland plant were obliterated for another seventeen years.

An equally dramatic conclusion followed the Boston Police Strike, which commenced on September 9, 1919. After the police commissioner, mayor, and governor refused to recognize a police officers' union and fired some of its leaders, three-fourths of the department declared a strike. After rioting broke out, Governor Calvin Coolidge sent the state militia in to quell the violence and crush the strike. Five citizens were killed by the militia and twenty others were critically wounded. Coolidge was unrelenting in his hostility toward the union and ultimately barred any of the strikers from being rehired. For his participation in putting down the strike, Coolidge was selected as the vice-presidential nominee by the Republican Party in 1920; he advanced to the presidency in 1923 upon the death of President Warren G. Harding. Elected to the presidency in his own right in 1924, Coolidge maintained his hostile stance toward labor throughout his term in office, which ended in March 1929.

The Red Scare and Palmer Raids

Coolidge, like the other Republican presidents who served during the decade, was a staunch individualist who believed that the government had little place in labor relations aside from intervening to break strikes in the name of public safety and economic progress. The height of the government's direct efforts to break up left-wing labor organizations came with the Red Scare and Palmer Raids of 1919–1920. Ostensibly, the action was designed to root radicals and Anarchists out of American society; yet the effects on the labor movement were devastating.

After terrorists sent a series of bombs to government officials and business leaders during April–June 1919, Attorney General A. Mitchell Palmer ordered a general roundup of suspected Communists and Anarchists. The Palmer Raids, which took about 6,000 suspects into custody, began in November 1919 and lasted until March 1920. Spurred on by the Red Scare, vigilante groups conducted a campaign against some labor unions, including the Industrial Workers of the World (IWW). Along with such direct violence, twenty states passed criminal syndicalist laws that hounded the IWW out of existence. Typically, the laws made it a crime to advocate labor reform through illegal or violent acts, which the IWW had done. Having reached its peak of membership and influence in 1917, by 1924 the IWW had ceased to function as a force in the labor movement. The postwar Red Scare itself petered out in 1920 after the attorney general—perhaps hoping to raise his profile for a presidential run—predicted massive unrest on May Day.

When the day passed without incident, fears of a radical threat to American society quickly dissipated. Although the embarrassment effectively ended Palmer's political career, his actions had accomplished much of what employers had sought in the immediate postwar era. Labor unions were branded as radical and un-American; many labor officials had been jailed or deported; and many industrial unions had been wiped out of existence.

The AFL in the 1920s

By 1920, the number of workers in unions had fallen back to its pre-World War I level. As before the war, most of them were concentrated among skilled craft unions in the American Federation of Labor (AFL). Yet the AFL was a weak advocate for the labor movement during the decade. On a national level, the AFL was debilitated not only by the hostile labor climate in general but by jurisdictional disputes among its member unions as well. A lack of creative, visionary leadership also hampered the organization's efforts. Longtime AFL president Samuel Gompers, who died in 1924, governed the body with his "pure and simple" vision of unionism. In Gompers's view, the AFL was best served by staying out of partisan politics, keeping the government out of labor relations, and focusing on the organization of skilled workers.

William R. Green, who succeeded Gompers in 1924, shared this conservative approach. Green valued consensus and conciliation over direct conflict, which put the AFL at a disadvantage as employers broke one local union after another in the 1920s. He was also unable to calm the factional storms that broke out whenever one AFL member union tried to poach members from another AFL union. Like Gompers, Green concentrated on keeping skilled craft workers as the base of the AFL, a tactic that eventually led to the formation of the rival Congress of Industrial Organizations for unskilled workers in 1935.

The constituent unions of the AFL varied widely in the political and economic power they exerted. The most powerful AFL union, the United Brotherhood of Carpenters, had a steady membership throughout the decade, with 322,000 members in 1929. Its president, William L. Hutcheson, stamped out rival organizing attempts from other AFL unions early on in the decade. Despite his potential for serving as a model for other union leaders, Hutcheson embodied the conser-

WILLIAM GREEN (1873–1952)

An important twentieth-century labor leader, William Green served as a major official in the United Mine Workers of America (UMWA) and as president of the American Federation of Labor (AFL). The son of a Welsh immigrant miner, Green was born in Coshocton, Ohio. He completed eight years of education and developed a lifelong, unshakeable commitment to evangelical Christianity. At the age of seventeen, Green began a twenty-one year stint as a miner. He married Jenny Mobley and raised six children. By 1891, he was an active member of the UMWA and served in a variety of local union offices.

The foundations of his union career were based on Christian ideals combined with an unyielding commitment to the efficacy of union-management cooperation. Eventually, his union activities took him out of the mines to leadership roles in the UMWA's national organization. He also served two terms as an Ohio state senator from 1910 to 1914. In both capacities, he was outspoken about his conviction to build partnerships with industrial capital that would benefit both sides.

In 1912, Green was elected national secretary-treasurer of the UMWA and then became a member of the AFL's executive council. During these years, he worked closely with UMWA president John L. Lewis. With the death of long-time AFL president Samuel Gompers in 1924, Green emerged as a compromise candidate and was elected president that year.

As AFL president, Green understood the conservative nature of the organization. Though personally committed to industrial unionism and social action, Green followed the lead of conservative craft unionists. He never developed a role as a social justice crusader. Instead, he used the presidency as a forum to push his beliefs that labor and management needed to form a close working relationship that would result in great benefits for all. He combined this strategy with a deep-seated belief in free enterprise, unconditional patriotism, and a rabid hatred of all forms of radicalism, especially communism.

When New Deal legislation provided the catalyst for major organizing drives in the 1930s, Green failed to exercise the necessary leadership. Still believing that employers would welcome unions, he hesitated to initiate industrial union drives to organize the mass production industries. This failure led to a major split between Green and Lewis and between industrial union advocates and AFL leadership. In 1937, several of these leaders separated from the AFL to form the Congress of Industrial Organizations.

Green did use supportive New Deal legislation and the protection of the World War II years to expand AFL membership. At the end of the war, with AFL membership at ten million, Green cultivated a true partnership with government and business but was devastated by consistent employer resistance and the Taft-Hartley Act (1947). By this time, AFL leaders gradually began to reassign Green's duties to future president George Meany. Green continued in office until his death in 1952.

R. David Myers

vative outlook that characterized the AFL's history. Having witnessed the destruction of ideological-minded union leaders countless times, Hutcheson embodied the pure and simple unionism of the Gompers era. At least Hutcheson could claim to have a degree of influence with the White House; he supported each of the Republican administrations and in turn was said to have turned down several offers to become the secretary of labor.

The most dynamic leadership in the AFL came from the president of the United Mine Workers of America (UMW), John L. Lewis. Although he had worked as a miner intermittently since his teenage years, Lewis's rise through the UMW's ranks began in 1910, when the thirty-year-old was elected president of a Panama, Illinois, local. He began serving as an AFL lobbyist in Springfield the following year and became an AFL vice-president in 1917. In 1920, when he assumed the presidency of the UMW, its membership base was already eroding from its wartime high of about 750,000 workers. As oil and gas challenged coal as sources of power and coal prices dropped, coal operators took advantage of the antilabor climate to attack the UMW in a seemingly endless series of confrontations.

Major strikes in 1922, 1923, and 1925–1926 set the tone for concession bargaining after 1928, when Lewis could no longer insist on a $7.50 a day wage in all the UMW's contracts. In some UMW districts, the daily wage rate dropped to $5.00—still better than the $1.50 nonunion coal operators received at the Pittsburgh Coal Company, which had violently mashed its UMW local in 1925—but the loss took away one-third of miners' wages nonetheless. By 1927, the UMW had fewer than 200,000 members.

TABLE 1. Labor Union Membership, 1920–1934

	Total Union Members	AFL-Affiliated Members
1920	5,034,000	4,079,000
1921	4,722,000	3,907,000
1922	3,950,000	3,196,000
1923	3,629,000	2,926,000
1924	3,549,000	2,866,000
1925	3,566,000	2,877,000
1926	3,592,000	2,804,000
1927	3,600,000	2,813,000
1928	3,567,000	2,896,000
1929	3,625,000	2,934,000
1930	3,632,000	2,961,000
1931	3,526,000	2,890,000
1932	3,226,000	2,532,000
1933	3,857,000	2,127,000
1934	3,728,000	3,045,000

THE EMERGENCE OF THE AMERICAN PLAN

The election of Warren G. Harding to the White House in 1920 under the banner of a "Return to Normalcy" began twelve years of uninterrupted Republican Party rule of the White House. It also marked the end of the Progressive Era in American life; indeed, the private sector was much more active than the government in shaping the outlines of labor activity during the decade. Having reestablished the "Open Shop"—that is, a workplace rid of labor unions—employers were intent on keeping the status quo in the 1920s. Although many employers had openly participated in the orgy of violence in 1919, most of their efforts throughout the decade took a more subtle approach. By 1921, these efforts to use scientific management, personnel reforms, and welfare measures had taken shape under the rubric of "The American Plan," a term first publicized by the National Association of Manufacturers and the National Chamber of Commerce in 1921.

SCIENTIFIC MANAGEMENT AND PERSONNEL MANAGEMENT

One aspect of the American Plan encouraged scientific and personnel management innovations to control the workplace and increase productivity. Whereas Henry Ford had concentrated largely on the principles of Taylorism in his operations, the dominant management philosophy in the 1920s articulated the need to study human relationships in the workplace, not just technological and mechanical improvements. The most significant example of this new outlook took place with a series of experiments conducted at Western Electric's (WE) Hawthorne Works from 1924 to 1933. Located in the western Chicago suburb of Cicero, Illinois, the Hawthorne plant made telephones and other electrical devices for WE. With a workforce that numbered up to 30,000 employees, the Hawthorne Works was the Chicago area's largest employer.

In the most widely publicized experiment, a study conducted by George Elton Mayo beginning in April 1928, a research group set up thirteen trials with five women from the assembly-line. Altering the workroom's illumination, the rest periods granted to workers, and the length of the working day and week, the researchers came to a surprising conclusion: there was no specific correlation between the changes made in the workplace and the level of worker productivity, which increased a total of 46 percent, even when working conditions were made measurably worse. Searching for a reason to explain this phenomenon, the researchers concluded that increased participation by workers in managerial decisions was more important than incentive pay schemes or physical conditions in improving output. WE implemented this conclusion by conducting over 10,300 interviews with its employees to discuss their opinions about their work environment in the hope of spurring company-wide productivity increases.

COMPANY UNIONS AND WELFARE CAPITALISM

Many employers cited these conclusions to demonstrate the importance of keeping the Open Shop. If a close relationship between employer and employee was the key to increased productivity and worker's satisfaction, then labor unions represented a threat to both these goals. Along these lines, many employers set up company unions to encourage workers to talk about efficiency, plant safety, and grievances with management. Company unions, sometimes called employee representation plans, were always controlled by management; the typical worker could vote for a representative to the union but otherwise had no say in its conduct. By 1928, over 1.5 million employees were enrolled in 399 company unions, and most of them worked for large-scale corporations such as Procter & Gamble and International Harvester.

An equally important part of the American Plan took the form of welfare capitalism, a term that en-

compassed a wide range of employer-sponsored benefits programs to win worker loyalty. At the Hawthorne Works, WE offered on-site medical care, a stock-ownership plan, after-hours educational courses, and sick benefits and vacation time that depended on the employee's length of service. WE also sponsored company sports teams and other social events for its employees and, like other employers, occasionally supported community institutions such as the YMCA or local churches through fund drives. Nationwide, a small but growing number of corporations sponsored a significant level of welfare capitalist programs in the 1920s; the programs were more common among large employers with secure market positions and less pressure to cut wages and costs.

Although the Hawthorne Works was invoked as the preeminent example of corporate America's beneficial influence on working-class life in the 1920s, welfare capitalist measures could take a more overtly paternalistic and anti-union form. The most notorious examples came from the textile towns of the North Carolina Piedmont region, where manufacturers had relocated from the late nineteenth century to avoid unionized workforces in New England. Everywhere in the Southern textile towns—from the company-owned housing to the company-controlled school to the company-run general store—workers were reminded of their employers' power. Employers claimed to keep the cost of living down by offering workers housing at half price, but workers were thrown out of their housing if they were suspected of supporting unions—or if they lost their jobs for any reason at all

The company-endowed and -operated schools also represented a bad bargain for workers. Poorly equipped and staffed, the typical mill school offered only eight grades, and children were routinely pulled from class to work during times of labor shortages. Company-run stores, where some workers, paid in company scrip, were forced to shop, also offered little real value for the mill hands. Although company stores typically offered credit to mill workers, the snare of debt trapped workers even further in poverty. If the company store was the only place to shop in town, workers were sure to pay a higher price for what they bought. Resentment against all of these factors contributed to a series of textile strikes in the Piedmont region in 1929 and 1930; all of them were crushed, typically with outright violence. With a wage rate of twenty-seven cents an hour for common labor in 1928—in contrast to the forty-nine cents that laborers in the Mid-Atlantic region earned—workers in the textile region remained among the most economically deprived in the country.

The Great Migration

While the labor movement faltered and the business community pressed its advantage in the 1920s, demographic trends proved equally important to the future of working-class life in America. The steady flow of European immigration was stopped by World War I, and restrictive immigration laws enacted in the 1920s kept the flow down to extremely low levels. Given the labor shortage induced by the war, a massive wave of internal migration of African Americans from the rural South took place to keep America's Northern industries running. Low cotton prices and the destruction of cotton crops by boll weevil attacks had already displaced thousands of agricultural workers during the war, and the repressive legal and social structure of the South served as an additional inducement to leave the region. From 1915 to 1920 at least 400,000 African Americans left for the North, and as many as one million joined them in the following decade in a movement known as the Great Migration. Chicago's African-American population jumped from 110,00 to 234,000 in the 1920s, and Detroit's increased from 6,000 on the eve of World War I to 120,000 in 1930.

The higher wages and less pervasive legal and social discrimination made the North "The Promised Land" to many of the migrants; yet restrictive covenants in housing and hiring practices that kept them from gaining higher wage jobs continued to make life a struggle for working-class African Americans. And although the direct violence of the Ku Klux Klan was not nearly as prevalent in the North as in the South, race riots took the lives of forty-nine victims in East St. Louis in 1917 and thirty-eight in Chicago in 1919. In East St. Louis, the riots were spurred by antagonism over the use of African-American workers as strikebreakers, a common tactic among anti-union Northern employers. Given the history of discrimination against African-American workers, racial tension proved to be a major stumbling block in the building of industrial unions in the 1930s.

Onset of the Great Depression

Between the stock market crash in October 1929 and the end of Herbert Hoover's term as president in March 1933, the American economy seemed to be in freefall. Unemployment—never accurately measured in the previous decade but estimated by some officials to be between 3.2 and 5 percent in 1929—climbed to

25 percent in 1932. In some cities, the rate hit unimaginable heights: one-third of New Yorkers were without a job, as were half of Detroit's workers, 40 percent of Chicagoans, and 80 percent of Toledoans. U.S. Steel, one of the nation's largest corporations, had a workforce of zero full-time workers in 1933, in contrast to its workforce of about 225,000 workers in 1929.

The welfare capitalist measures of the 1920s mostly fell by the wayside after 1929, although some employers started food and clothing banks for their laid-off employees. Still others inaugurated part-time work schedules to spread wages around, or allowed employees to grow vegetables on unoccupied company land parcels. Public relief efforts were somewhat better organized but equally ineffective after the first two years of the Depression. As *Fortune* reported in a September 1932 expose under the scathing title "No-One Has Starved," local relief agencies had already buckled under the economic collapse: "Food only, in most cases, is provided and little enough of that. Rents are seldom paid. Shoes and clothing are given in rare instances only. Money for doctors and dentists is not to be had."

President Hoover appointed federal commissions to study the problem but stood by his claim that voluntary relief efforts would carry the nation through the crisis. Hoover's integrity took a final blow in a conflict with the Bonus Expeditionary Army on July 28, 1932. About 20,000 Bonus Marchers had come to the capital to demand the immediate payment of a bonus promised to veterans of World War I set to be paid in 1945. Hoover, seeing a radical insurrection unfolding, ordered troops to oust the protesters, who had encamped in various federal buildings and landed in the Anacostia section of Washington, D.C. Two veterans were killed in the ensuing conflict, and one infant later died of his injuries. Images of the burning Bonus Army camps revolted many Americans, who saw Hoover as a callous tyrant. His reputation never recovered from the incident.

In the end, Hoover's only substantial relief efforts came through the Reconstruction Finance Corporation (RFC), which made money available to states to support work-relief programs in 1932. Criticized as a "millionaires' dole," the RFC was a minimal response to the unfolding economic tragedy. In one last bid for working-class support as he started his reelection bid, Hoover even claimed credit for passage of the Norris-LaGuardia Anti-Injunction Act of 1932, legislation that he had long opposed. In addition to outlawing "yellow dog" contracts forbidding union membership in the workforce, the act severely limited the use of federal injunctions to break up strikes. It also freed union leaders from liability for damaging acts carried out by union members, unless such acts had been advocated by union leadership.

The Norris-LaGuardia Act was the only significant piece of legislation to favor the labor movement under the twelve years of Republican rule, and few were fooled by Hoover's last-minute capitulation to the Act's passage. In November 1932, Hoover lost his reelection bid when he retained less than 40 percent of the popular vote. In his place, New York governor Franklin Delano Roosevelt ended twelve years of Republican rule as he took over the White House.

THE PIVOTAL YEAR 1934

Throughout the 1920s, successive Republican administrations had scaled back or eliminated Progressive Era reforms that had improved working conditions while conservative federal courts issued injunctions to break strikes. As a result of Roosevelt's New Deal programs, the federal government reversed both of these trends by taking itself into labor relations on an unprecedented scale. For the labor movement, the most important act of Roosevelt's first year in office was the National Industrial Recovery Act (NIRA), which he signed into law on June 16, 1933.

The NIRA established a code of fair competition supervised by the National Recovery Administration (NRA) and temporarily suspended antitrust rules, which allowed businesses to plan production on an industrywide basis. In exchange for this favor, the NRA mandated a minimum wage, to be set by industry, and a forty-hour maximum work week. From the start, the NRA's work was roundly criticized. As they had during World War I, most business leaders resented the government's involvement in the private sector. Other critics argued that the NRA's reach did not go far enough in fundamentally restructuring the economy. Still others were simply baffled by the complex bureaucracy that the creation of the NRA entailed.

Nothing symbolized the controversy and confusion over the NIRA better than its Section 7(a). The section declared "That employees shall have the right to organize and bargain collectively through representatives of their own choosing, and be free from interference" by their employers in such efforts. The section also prohibited employers from forcing their workers to join company-controlled unions or from firing them for joining independent labor unions. Yet the NIRA did not specify penalties against employers for failing to follow Section 7(a); nor did it set up an

administration to oversee the implementation of the article. Thus, while Section 7(a) seemed to place the weight of the government behind unionization, it did little to clarify how workers could actually organize labor unions. In the wake of the NIRA's passage, a new wave of labor unrest swept the country as business and labor tested the real impact of Section 7(a) in the work place.

The Auto-Lite Strike

The strike at the Auto-Lite factory in Toledo, Ohio, was one of the first to test the actual meaning of Section 7(a). A small group of workers at the auto parts plant had struck for union recognition in late February 1934, an action that made little headway with the company's staunchly anti-union management. On April 13, 1934, the majority of the plant's workers walked off the job again, with union recognition at the top of their list of demands. The strike quickly turned into a mass movement in the city, as four other major plants were also shut down by strikes. With thousands of strikers and their supporters gathering at the Auto-Lite plant throughout May 1934, the company armed its guards with machine guns and tear gas in preparation for an assault, even as it refused to bargain with the union.

After someone in the factory threw a steel bracket at striker Alma Hahn on May 23, 1934, a riot erupted among the 10,000 protesters. Four days of unrest, including the shooting deaths of one striker and one strike supporter, were finally put down by about 1,350 National Guardsmen; about two hundred others were injured. When Governor George White refused the company's request to forcibly reopen the plant, Auto-Lite's management finally agreed to recognize the union. With a five-cent increase in wages and a minimum wage set at thirty-five cents, the plant reopened on June 5, 1934, with AFL Local 18384 as the recognized bargaining agent for the factory's workers. The following year, after the establishment of the Congress of Industrial Organizations, Local 18384 became Local 12 of the United Auto Workers union.

The Teamsters' Strike

Workers in Minneapolis also tested the limits of the NIRA in 1934. After Teamsters organizer Ray Dunne led a successful strike by coal truck drivers in early February 1934, Local 574 signed up between 2,000 and 3,000 members and demanded union recognition, a wage hike, and overtime pay from employers. The conflict quickly went beyond the collective bargaining table, however, as the anti-union Citizens' Alliance (CA) jumped into the fray. Declaring the Teamsters' action a bid to radicalize the city's working classes, the CA began arming its members for a violent confrontation. A series of battles between strikers and the CA at the city's public market on May 21–22 left two CA members dead. Under pressure from Governor Floyd Olson, who was sympathetic to the strikers, the employers' group signed an agreement to abide by Section 7(a) on May 25. The truce was short-lived as the CA broke its agreement just weeks later. On July 16, 1934, the Teamsters went out on strike again.

The second strike turned into a more protracted affair, lasting thirty-six days. Crowds of up to 100,000 union supporters poured into Minneapolis, and another violent confrontation on July 20 left two strikers dead and fifty injured. The governor declared martial law on July 26. After intense efforts by Roosevelt's representatives, the CA finally was brought into an agreement with the Teamsters, which gained undisputed recognition as a bargaining agent and a minimum wage for its members. Within two years of the strike, Local 574 represented members at 500 Minneapolis-area companies, and the Citizens' Alliance was effectively broken as a power in the city.

The Maritime Workers' Strike

The biggest of the three urban strike waves culminated in a general strike in San Francisco from July 16–19, 1934. On May 9, 1934, International Longshoremen's Association workers along the entire Pacific Coast (with the exception of Los Angeles) went on strike under the leadership of Harry Bridges. As in the other strikes, higher wages, reduced hours, and more equitable hiring practices were among the reforms demanded by strikers, along with their chief goal, union recognition in collective bargaining. The Industrial Association of San Francisco (IASF), a coalition of anti-union employers, took the lead in battling the maritime workers' strike. In conjunction with the local police, the IASF disrupted a July 5 strike protest by shooting into the crowd; two strikers were killed and dozens more were shot on that "Bloody Thursday," as the day became known. Over the next few days, a grassroots call for a general strike began brewing among San Francisco's workers. On July 16, with the reluctant support of most of the city's labor leadership, at least 130,000 workers essentially shut down the city.

The strike was called off three days later after

Tanks prepare to roll in to break the general strike in San Francisco in 1934. Some 130,000 strikers—including trolley drivers, construction workers, teamsters, and bartenders—had brought the city to a virtual standstill for four days. *(© Underwood Photo Archives, Inc.)*

pressure from the Roosevelt administration, and the maritime workers later achieved most of their demands in a federal arbitration ruling. Not only had the union won recognition as a bargaining agent, it also gained joint control with employers over the hiring process, higher wages, and an overtime provision. By the end of 1934, 1,856 strikes involving 1,470,000 workers had taken place.

Together with a renewed series of textile strikes in the Carolinas, the major urban strikes of 1934 demonstrated the problems in administering the vague clause of Section 7(a) of the NIRA. The NIRA itself was soon deemed irrelevant, however, when it was declared unconstitutional by the U.S. Supreme Court in 1935. In response, the Roosevelt administration fought to pass the National Labor Relations Act (often called the Wagner Act), which the president signed into law on July 5, 1935. Unlike the NIRA, the Wagner Act not only guaranteed the right of workers to bargain collectively, but specified how that right would be enforced. It also created the National Labor Relations Board to issue injunctions over unfair labor practices, to oversee union elections, and to hear grievances between labor and management. The most significant piece of legislation to govern labor relations in the twentieth century, the Wagner Act opened up a new era in the history of the American labor movement.

TABLE 2. Work Stoppages and Workers Involved, 1920–1934

	Work Stoppages	Workers Involved
1920	3,411	*
1921	2,385	
1922	1,112	
1923	1,553	
1924	1,249	
1925	1,301	
1926	1,035	
1927	707	330,000
1928	604	314,000
1929	921	289,000
1930	637	183,000
1931	810	342,000
1932	841	324,000
1933	1,695	1,170,000
1934	1,856	1,470,000

SUMMARY

Coming as it did between the Progressive Era and the New Deal, it is tempting to dismiss the period from 1920 to 1934 as a mere interruption in the growth of the American labor movement's economic, social, and political power in the first half of the twentieth century. At the time, however, the powerful alliance of business and government seemed permanent. The conservative—and at times, reactionary—coalition of antilabor interests found expression in the politics of "normalcy," the rhetoric of unswerving patriotism, and the implementation of the American Plan. The impact of these forces meant that the era passed without significant labor reform, regulation, or legislation. They also ensured that wage gains for workers lagged far behind what was necessary to generate a sustainable consumer economy. A mass production, mass consumption economy as envisioned by Henry Ford and others during the Progressive Era would take another generation to achieve.

The labor movement itself—torn apart by ideological dissension, power struggles, and an almost universally lethargic leadership—in large part failed to rise to the challenges presented by what was admittedly one of the most antilabor periods in American history. Ideologically minded unions such as the IWW were no match for the might of the government's Palmer Raids and Red Scare. At the other end of the spectrum, the AFL's inability to reach out to unskilled workers in favor of a narrow vision of craft unionism was increasingly out of step with the modern industrial landscape. The best that can be said for the labor movement's generally conservative leadership is that in endorsing material goals over more visionary strategies, workers were particularly disillusioned when their consumerist dreams vanished with the Great Depression. The devastation was so complete that the majority of the working class turned their loyalties to their unions and Roosevelt's administration with a decisiveness that made the weaknesses of the prior decade's labor movement all the more telling.

Communist Movement

The Communist Party of the United States has had a variety of names and a complex history. It had deep roots in, and a significant impact upon, the multicultural U.S. working class and the American labor movement, as well as the intellectual and cultural life of the United States. Animated by a revolutionary interpretation of the Socialist theories of Karl Marx, and by the example of the Russian Revolution of 1917 led by Vladimir Ilich Lenin, it was part of a powerful international movement that arose in 1919 under the banner of the Communist International.

As part of that international movement, American Communism came under the domination of the Russian Communist Party, which had succeeded in establishing a revolutionary regime in what had once been the Russian empire, ultimately renamed the Union of Soviet Socialist Republics (USSR) or Soviet Union. As this regime became increasingly bureaucratic and authoritarian, there were problematical consequences throughout the world Communist movement, including the movement in the United States. One result was a three-way split in the late 1920s, with an overwhelming majority remaining in the organization that became increasingly subordinate to the ruthless dictator of the USSR, Josef Stalin.

Consequently, the Communist mainstream became marked by a combination of revolutionary idealism and the extremely negative qualities associated with the Stalinist dictatorship. This problematical reality weakened both the Communist Party and the American Left; nonetheless, a number of American Communists made substantial contributions to struggles for social change.

Sources

The rise of Communism in the United States cannot be understood without examining its sources and origins in a number of American realities. From the end of the American Civil War (1861–1865) through the 1890s, the capitalist economic and social order of the United States experienced a tumultuous transition of industrialization, corporatization, and expansion that had a powerful impact on various segments of the population. The country became the world's leading manufacturer, and dramatic increases in economic productivity brought phenomenal increases in the wealth of the nation.

The benefits and expenses of this development were unevenly distributed. Although tremendous opportunities opened up for enterprising financiers and industrialists, many smaller businesses were destroyed, and small farmers throughout the country found their farms and livelihoods placed in jeopardy by the dynamics of the new structures of power and market forces unleashed in this "Gilded Age" transition.

The country's working-class majority felt multiple impacts. Many skilled trades were increasingly replaced with occupations requiring unskilled (and cheaper) labor—more easily dominated and more intensively exploited by employers. Efforts to organize unions for improvements of wages and working conditions were routinely attacked and broken by employers (with the often violent assistance of both private "police" and governmental authorities). Massive waves of immigration also undermined gains that workers were able to win—flooding the labor market with impoverished and often desperate laborers from a variety of different cultures, often suffering ethnic and racial discrimination, and pitted against each other by employers seeking to control their workforce more effectively.

The most intense discrimination was usually reserved for African Americans who had been betrayed by a post-Reconstruction compromise that denied them equal citizenship rights and generally kept them on the lowest rungs of the socioeconomic ladder. Institutional racism was enforced by state and local gov-

ernments throughout the South, buttressed by lynchings and Ku Klux Klan terrorism; in the North, systematic discrimination in defense of white privilege was widespread. Women of all races were also subjected to second-class citizenship—denied the right to vote, undermined by multiple varieties of legal and economic discrimination, and subjected to various forms of sexual harassment and double standards.

There were yet other negative developments—notably, the pervasive corruption of politicians by wealthy interests, multiple business abuses, the systematic cheating of consumers by unscrupulous manufacturers, and the despoliation of urban areas, rural areas, and nature itself for the purpose of maximizing profits for the greedy few. Periodically, the "boom-and-bust" business cycle would generate devastating depressions, throwing millions of people out of work and plunging them into poverty. Many charged that the immense concentration of wealth into a few hands was changing the American republic from a democracy into a plutocracy (rule by the rich instead of rule by the people). And there were growing concerns that U.S. foreign policy was evolving in the direction of imperialism—economic expansionism beyond the borders of the United States in search of business profits—that would embroil the country in oppressive and exploitative relations with weaker peoples and draw the United States into dubious wars.

Intellectuals and artists were among the first to give powerful expression to such concerns. But these developments generated an array of dissident currents and protest movements, the most dramatic being the Populist movement of the late 1880s and the 1890s as well as a number of feminist and antiracist efforts. Especially important was the growth of a substantial labor-radical subculture reflected in a succession of organizations—the National Labor Union, the Knights of Labor, the Eight Hour Leagues, the Workingmen's Party of the United States, the American Federation of Labor (AFL), the Socialist Labor Party, the International Working Peoples Association—as well as a series of often violent strikes and labor conflicts, such as the rail strike and labor upsurge of 1877, the 1886 eight-hour demonstrations culminating in the Haymarket "riot," the Homestead strike of 1892, and the Pullman strike of 1894.

Beginnings

The Progressive Era of the early twentieth century saw the culmination of such protests and struggles in a nationwide political shift that caused some elements in both the Democratic and Republican parties to tilt in a radical direction toward challenging the power of big business. It also resulted in the political mainstream, which, under such presidents as Theodore Roosevelt and Woodrow Wilson, began to flow in a direction that favored an increase in government regulation of the economy and fostered reforms designed to eliminate corruption and abuses, as well as to help the disadvantaged, in order to dampen radical sentiments. Within this context, a variety of movements and organizations dedicated to far-reaching social reforms were established. Among these were the National Association for the Advancement of Colored People (NAACP), struggling for equal rights for blacks, and a new wave of feminism, focused on winning the right to vote for women but also struggling for greater educational and occupational opportunities as well as for access to birth control.

By 1901, many of the remnants and continuations of the labor-radical tradition combined with other elements (former Populists, Christian Socialists, radicalized feminists, leftward-moving intellectuals, battle-scarred trade unionists, and others) to form the Socialist Party of America. Its peak was reached in 1912, with 118,000 members throughout the country and with 323 publications (in English and other languages) with a total circulation of more than 2 million. The weekly newspaper *Appeal to Reason,* published in Girard, Kansas, had the largest circulation—more than 761,000. In 1912, Socialist leader Eugene V. Debs (who had led the 1894 Pullman strike) polled 6 percent of the presidential vote, and Socialists held 1,200 elected offices in 340 cities, including seventy-nine mayors in twenty-four states. Socialist congressmen were elected from New York City and Milwaukee, Wisconsin, and as late as 1918 Socialists elected thirty-two state legislators and were making a positive showing in several municipal elections. Socialists led and strongly influenced about one-third of the unions in the AFL, and many Socialists also played a central part in establishing the more militant Industrial Workers of the World (IWW), which assumed a vital role in organizing inclusive, multiethnic, multiracial struggles among unskilled industrial workers.

Sharp differences emerged between more reformist Socialist Party currents led by Representative Victor Berger (Socialist-WI) and labor lawyer Morris Hillquit on the one hand, and more revolutionary-minded figures such as Debs and IWW leader "Big Bill" Haywood. The moderate elements dominated the party apparatus and sought to minimize left-wing influence. In the face of the patriotic hysteria and

fierce government repression unleashed by the United States' entry into World War I in 1917, the bulk of the Socialist Party held to its antiwar position. And when, in the same year, the Bolshevik revolution proclaimed the world's first "workers' state" in Russia (dramatically described in eyewitness reports in the Socialist press by radical journalist John Reed, whose classic account *Ten Days That Shook the World* would soon be published), the Socialist Party as a whole greeted it with enthusiasm.

But the Socialist left wing felt that the antiwar position was being soft-pedaled by the moderates and that U.S. Socialists should apply the Bolshevik model of organization and revolutionary strategy to American conditions. When it became clear in 1919 that the left wing was winning over a party majority, the moderates engineered massive expulsions, eliminating the bulk of the left wing and over half the membership. In addition to the bulk of the Socialist Party's left wing, many IWW activists and AFL militants were drawn to the example of the Russian Revolution. Among others who were attracted were some black Socialists who, led by Cyril Briggs and Richard B. Moore, organized in a significant group called the African Blood Brotherhood.

Under such circumstances, a newly formed Communist Party might have been expected to emerge with 80,000 members and substantial influence. But fierce government repression and no less fierce factional disputes (which resulted in two Communist parties being formed) guaranteed that this would not happen. The Communist Party of America (CPA) probably had fewer than 25,000 members, and the Communist Labor Party (CLP) may have had about 15,000.

The CPA, dominated by the foreign-language federations (especially the federation made up of Russian immigrants headed by Nicholas Hourwich and the Jewish federation led by Alexander Bittelman) that had been expelled by the Socialist Party, claimed to be more attuned to the Bolshevik model. As such, it attracted the talented young Italian-American intellectual Louis Fraina, the stalwart Ohio Socialist organizer Charles Ruthenberg, the dynamic former student Socialist leader Jay Lovestone and his classmate William Weinstone, millionaire Rose Pastor Stokes, the studious teacher Bertram D. Wolfe, and Juliet Stuart Poyntz, who had been education director of the International Ladies' Garment Workers' Union.

The Communist Labor Party, which claimed a greater connection with U.S. realities and the American labor movement, included the flamboyant "all-American" radical John Reed, the volatile Irish-American workers' leader James Larkin, Ben Gitlow (one of ten New York Socialist state legislators elected but refused their seats in the super-patriotic atmosphere of the times), the seasoned IWW organizer James P. Cannon, the experienced AFL Socialist militant William F. Dunne, and veteran Socialist Party organizer Ella Reeve Bloor.

Although most of these leaders remained in the Communist movement for years to come, many rank-and-file Communists found it difficult to endure the government repression, disillusionment over the failure of the hoped-for revolutionary upsurge to materialize in the United States, and the debilitating disunity. Both organizations ended up with fewer than 10,000 members combined, but continued to denounce each other and seek exclusive recognition as the "real" U.S. Communist Party from the newly formed Communist International. Instead, the leaders of the Communist International insisted on unity, which was finally achieved in 1921, although there was still a factional fight over whether the organization should be predominantly "underground" in the way that the Russian Bolsheviks had been. (The Russian leadership of the Communist International concluded that, given the relatively free conditions existing in the United States, maintaining such an underground existence made no sense.) The unified organization was able to establish a more stable existence, reversing the membership decline, and to begin attracting significant recruits, such as the famous leader of the 1919 steel strike, William Z. Foster.

The unified party took the name Workers Party of America. In 1925, the organization's name changed to the Workers (Communist) Party of America and, by 1930, to the Communist Party of the United States of America.

The Communist International

The Communist International (also known as the Comintern and the Third International) was of decisive importance to the origins and subsequent development of American Communism. When established under the leadership of the Russian Communists, it was projected to be a world party of Socialist revolution in which all national sections and individuals would enjoy a comradely equality. Not surprisingly, however, it was the Russians who were naturally seen as the leaders inasmuch as they had made a successful revolution and were the hosts and financiers of the Comintern.

"In the first days of the October revolution—that

is the Bolshevik revolution—the Russians were leaders through prestige, through achievement, through the fact that they conquered one-sixth of the world for socialism," recalled Jay Lovestone, some years later. "We had an attitude of almost religious veneration toward them . . . But I must say in fairness to the Russian leaders at that time they did not advocate this, they did not nurture this." In fact, according to Lovestone "they tended to treat us as equals, with equal respect: respecting our opinions, and we appreciated that. They were big men, and because they were big men they did not act in little or small ways, but nevertheless the Russian influence was decisive."

According to James P. Cannon, he and his comrades "learned to do away forever with the idea that a revolutionary socialist movement, aiming at power, can be led by people who practice socialism as an avocation. . . . Lenin, Trotsky, Zinoviev, Radek, Bukharin—these were our teachers. We began to be educated in an entirely different spirit from the old lackadaisical Socialist Party—in the spirit of revolutionists who take ideas and programs very seriously." Bertram Wolfe concurred, noting that before 1925 it was *not* the case that "all important decisions for the American Communist party were being made in Moscow"—rather, communications from Lenin, Zinoviev, and other Comintern leaders "were intended only as helpful suggestions, often exciting ones, and as successful examples to imitate after adapting them to American conditions, but not as categorical commands."

Lovestone recalled that by 1924, when Comintern leader Gregory Zinoviev was allied with Josef Stalin against Leon Trotsky, there developed "sharp, unprincipled factionalism—I would say suicidal factionalism—in the Russian party, [and] the Comintern policies began to be involved in and determined by factional struggles inside the Russian party. . . . First there was the beginning of slavishness and mechanical transference, and what I called the Byzantine court at Moscow—kowtowing before the potentates, but it was not yet worked up into a system. . . . Then that culminated in the triumph of Stalin in Russia and thereafter the triumph of Stalin in the Communist International."

"Everything had been settled behind the scenes," Cannon observed about a typical situation in the Comintern of the mid-1920s. "The word had been passed and all the secondary leaders and functionaries in the Comintern were falling into line." When radical intellectual Max Eastman complained to Foster of a highhanded action of Comintern leadership, Foster responded: "Max, a lot of things happen here that I don't like. But we can't do anything about it. They've got the prestige. No revolutionary movement anywhere, as things stand now, can prosper without their backing."

The Political Accomplishments of the 1920s

Although the American Communists benefited from the revolutionary prestige of the early Soviet Republic, and from various forms of Comintern assistance, their own initiative and creative energy were decisive in making the Workers Party a significant force in the 1920s.

Under William Z. Foster's leadership, an influential network of leaders and activists was created in the AFL through the Trade Union Educational League (TUEL). In its monthly periodical *The Labor Herald,* and in its many pamphlets and public meetings, it sharply criticized corruption, exclusionary practices, and conservatism in existing unions. It also put forward a program that urged craft unions to amalgamate to form industrial unions; to establish a shop delegate system to ensure rank-and-file control of unions; to create a labor party; to enact reforms such as unemployment insurance; and to support the Soviet Republic in Russia and the eventual creation of a workers' republic in the United States. Progressive union leaders and activists rallied to many of these demands, and through sustained TUEL efforts a number of unions were influenced by the TUEL program, as were central labor councils in Chicago, Minneapolis, and other cities.

Trade union activists who had gotten experience through the TUEL (and through its early 1930s successor, the Trade Union Unity League) went on in the later 1930s and 1940s to play prominent, dynamic roles in building a powerful labor movement through the organizing drives that were part of the rising Congress of Industrial Organizations.

The American Communist Party was also involved in defending civil liberties, particularly those of workers, through the International Labor Defense (ILD). The ILD had been conceived of during discussions between "Big Bill" Haywood, Rose Karsner, and James P. Cannon (Cannon would become its national secretary when it was set up in 1925). The ILD provided aid to hundreds of "class-war prisoners," regardless of political affiliation, who had been imprisoned or otherwise persecuted during the fierce government repression during World War I, during

the postwar "Red Scare," as well as in subsequent strikes, labor struggles, and other situations. It publicized the cases (through the *Labor Defender,* meetings, picket lines, and other means), raised money, and often secured legal assistance. During the 1920s, its most famous cases were those of the Italian Anarchists Nicola Sacco and Bartolomeo Vanzetti, as well as those of militant Socialists and trade unionists Tom Mooney and Warren K. Billings.

In the following decade, the ILD would become best known for its defense of Angelo Herndon, a black Communist arrested and imprisoned for making a radical speech in Georgia, and "the Scottsboro boys," nine young black men accused and convicted of raping two white women in Alabama (although the trial was blatantly unfair and one of the women later recanted). Such cases became important symbols of antiracist struggle.

Especially through the insistence of the Communist International, the American Communist Party began to give more consistent and careful attention to the problem of racism and the plight of African Americans than had ever been the case among U.S. left-wing organizations. A small but important core of black workers and intellectuals came to see, in the words of Harry Haywood, "the elimination of racism and the achievement of complete equality for Blacks as an inevitable byproduct of socialist revolution in the United States." In 1925, the American Negro Labor Congress was organized, headed by the flamboyant Lovett Fort-Whiteman (who later went to live in the USSR and perished in Stalin's purges), which published *The Negro Liberator.* A cadre of 200 black Communists developed, which was able to assume a major role during the struggles of the 1930s among the unemployed and unionizing industrial workers, against racism in the United States, and against fascism abroad.

The Communist slogan "black and white, unite and fight" was to be symbolized in the 1932 presidential election when black party leader James W. Ford was selected as the vice-presidential running mate of William Z. Foster. Several thousand blacks joined the Communist Party during that decade and began to wield a dramatically widening influence within the black community. As a result, Communists played a sometimes pivotal role in the antiracist struggle. Black lawyers such as Benjamin J. Davis (who later served as a Communist on New York City's city council) and William Patterson (who later headed up the ILD and later the Civil Rights Congress), such writers as Langston Hughes and Richard Wright, singer and actor Paul Robeson, and the great African-American scholar W.E.B. Du Bois were among those drawn to the Party's ranks or periphery.

The Communists coordinated an impressive array of immigrant fraternal, cultural, and social organizations, and sought to help protect the rights of immigrants through the broad-based National Council for the Protection of the Foreign Born, which was established in 1926 and formed a coalition of organizations representing 700,000 members. It should be noted that a majority of U.S. workers in many areas in this period were first- and second-generation immigrants—the fraternal organizations were vitally important for affirming and preserving one's culture and protecting one's rights from a pervasive anti-immigrant bigotry. In the 1930s, this was broadened into a multiculturalism that was counterposed to the rising tide of fascism. The 1930s also saw the organization of the influential International Workers Order, organized by ethnic units (Italian, Jewish, Hungarian, Serbo-Croatian, Slovak, Ukrainian, Greek, Polish, and so on), which provided insurance and other benefits, sponsored various cultural and political activities, and had 150,000 members.

Women made up less than 20 percent of Communist membership throughout the 1920s (it was to rise by more than 10 percent in the 1930s). Nonetheless, Communism took a formal position in favor of equal rights for women, and several women were prominent in leadership positions (Ella Reeve Bloor, Rose Pastor Stokes, Juliet Stuart Poyntz, Rose Wortis, Sylvia Bleecker, Rose Karsner, among others). Attention was given to "the woman question" through articles, pamphlets, and books; through International Women's Day events on March 8 of every year; and through classes and discussions. Often this attention was accompanied by a rejection of "bourgeois feminism" and an emphasis on the special problems of working-class women, for example, through the United Council of Working-Class Women, headed by Kate Gitlow (mother of party leader Ben Gitlow), and the publication of the periodical *Working Woman.* As has often been pointed out, the Communist Party's views on "the woman question" could be quite narrow, although sometimes in Communist circles there was a linkage of gender-class-race issues that was remarkably ahead of its time. By the 1930s, women in and around the Communist Party were able to engage in discussions and activities (discussions around the 1936 Women's Charter asserting the rights of women to full equality in all spheres of social activity, activities to provide full rights and representation for

women in the workplace and labor movement) that helped create new perceptions of womanhood and set the stage for the later feminist resurgence.

The Young Workers League, later renamed the Young Communist League, was organized in 1922 for activists in their teens and twenties, with Martin Abern as national secretary and Max Shachtman as editor of the monthly *Young Worker.* By 1925, it had an estimated membership of 4,000. The Young Pioneers of America was established for children between the ages of seven and fourteen, with a magazine first called *Young Comrade* and then *Young Pioneer.*

Other Communist-sponsored organizations included the United Farmers Educational League, the Friends of Soviet Russia, the All-American Anti-Imperialist League, and many more—some of which evolved into larger and more influential organizations in the 1930s.

Through innumerable books and pamphlets published by International Publishers and Workers Library Publishers, through the *Daily Worker* (launched in 1924), through a variety of English- and foreign-language periodicals (twenty-seven journals in nineteen languages, with a total circulation of 177,000), through classes (including an impressive curriculum

organized under the directorship of Bertram D. Wolfe for the Workers School in New York City), through rallies and Communist electoral campaigns, and through hard work in a variety of organizations and movements, the Communists sought to spread Marxist ideas and deepen socialist consciousness. The cultural and intellectual life of the Communists contributed to the ability of some members to contribute to the larger cultural and intellectual life of the United States during the 1920s and even more during the 1930s and 1940s—in scholarship, literature, music, graphic arts, theater, film, and more.

Although Party membership fluctuated between 7,000 and 12,000 throughout the 1920s, many thousands more were drawn to its activities and influenced by its efforts, and American Communists were positioned to play a significant role in coming decades. But the factional conflicts of the 1920s, and the final outcome of those conflicts, also did much to undermine the Communists' ability to realize the potential of their movement.

The Factional Wars of the 1920s

In addition to a deep idealism, a profound opposition to oppression and exploitation, and an uncompromising commitment to the creation of a society of "the free and equal," the leadership of the Communist Party was marked by a variety of personalities, egos, ambitions, and "careerist" aspirations. In addition, serious differences arose as to how best to build the Communist Party and to advance the struggles of the workers and the oppressed. A major difference emerged around the issue of how to best impact the larger political life of the United States. As the Democratic and Republican parties shifted rightward and as "mainstream" politics pulled in a more conservative direction in the 1920s, a variety of oppositional currents in the working class, among farmers, and among intellectuals and "middle-class" reformers gave intense consideration to the creation of a third party.

By 1923, a Hungarian Communist and Comintern representative who went by the name of John Pepper (his actual name was Joseph Pogany) had insinuated himself into the leadership of the U.S. Communists, gathering around himself the party's general secretary Charles Ruthenberg, Jay Lovestone, Ben Gitlow, and others. Under Pepper's influence, they pushed the party into a set of disastrous adventures in the third-party movement. Progressive trade unionist John Fitzpatrick, head of the Chicago Federation of Labor and a powerful ally of William Z. Foster's TUEL, initiated a conference to begin the development of a new radical farmer-labor party. Pepper's efforts culminated in the Communists packing the conference with representatives of their own "front" groups and pushing through—over Fitzpatrick's angry objections—the premature creation of a supposed farmer-labor party based on their own fantasies.

Fitzpatrick and other trade union progressives in the AFL immediately broke with the Communists and facilitated the destruction of TUEL influence in the AFL. A genuine farmer-labor effort—the Conference for Progressive Political Action (a broad-based coalition of unions, reformers, and Socialists)—excluded the Communists and ran Senator Robert M. La Follette (R-WI) for president in 1924 on the new Progressive ticket, which would receive 4 million votes. But by this time the Communists had been frozen out of the third-party movement, and differences among the Comintern leadership caused them to scuttle any efforts to reverse that process. The Communist Party ended up running its own candidates, Foster and Gitlow, in the presidential race, in a pale campaign that netted a paltry 33,000 votes.

Additional "clever" maneuvers of the Pepper–Ruthenberg–Lovestone leadership generated the rise of a strong oppositional current—an alliance of two caucuses led by William Z. Foster and James P. Cannon. The Foster–Cannon opposition, rejecting schemes that would cause the Communists to overreach themselves, insisted on building solid united-front efforts, with special attention to building a base within the Progressive wing of the AFL. The ability of the Foster–Cannon caucuses to secure a majority only intensified the factional conflict, for which Lovestone proved to be especially talented.

The Comintern pulled Pepper out of the United States and initially seemed to favor a semiharmonious balance between the factions. At one point, Cannon, Bittelman (breaking temporarily from the Foster caucus), and Weinstone (breaking temporarily from the Lovestone caucus) sought to cut across the factionalism to help create a more unified, "Bolshevized" Communist Party, but the factionalized situation continued. A remarkable intervention of the Comintern then tipped the scales in 1925—in effect dictating that the Ruthenberg–Lovestone faction should be the leadership of the Party. As it turned out, this represented a decisive move on the part of the Stalin faction inside the Russian Communist Party to bring various sections of the Comintern under its control. A special concern was exhibited to minimize the influence of potential left oppositionists who might be drawn into

support for Stalin's chief rival, Trotsky. When Ruthenberg died in early 1927, Lovestone moved quickly to assume full leadership and to intensify an uncompromising struggle against anyone who might challenge that leadership.

Communist Fragmentation

An anti-Trotsky campaign was being orchestrated throughout the Comintern, and under Lovestone's leadership—ably supported by Wolfe, Gitlow, and others—this campaign was advanced among the American Communists. Ludwig Lore, a prominent German-American Communist, had been expelled in 1925 at Lovestone's initiative, in part for defending Trotsky. "I know everyone of our boys is solid with Stalin," Lovestone asserted proudly when Trotsky and Zinoviev established a united opposition to challenge the crystallization of the bureaucratic dictatorship in the USSR in 1926. But the Party was shaken in 1928 when James P. Cannon and some of his closest associates (Max Shachtman, Martin Abern, Rose Karsner, and others) were brought up on charges and expelled for Trotskyism. Disgusted and disheartened by the factionalism and what he viewed as unprincipled maneuvering that seemed to characterize so much of the internal life of American Communism and the Comintern as such, Cannon had in fact been won over to Trotsky's critique of Stalinism. He and about 100 expellees promptly organized the Communist League of America in 1929, basing themselves forthrightly on Trotsky's revolutionary perspectives.

But 1929 also saw a dramatic "leftist" zigzag in Stalin's policies inside the USSR and its Communist Party, as well as within the Comintern. Over the objections of his moderate-Communist ally Nikolai Bukharin (with whom Lovestone and his associates had nourished a close relationship), Stalin had pushed through a brutal forced collectivization of the land and a rapid industrialization policy in the USSR. Stalin's decision brought extreme hardship and even death to millions of peasants and workers and was accompanied by an intensification of extreme dictatorial measures. Also over the objection of various elements in the Comintern (including Lovestone and his supporters), Stalin began imposing an ultra-left turn on Communist Parties throughout the world, calling on them to reject alliances with all others on the left, to split the trade union movement in order to establish Communist-led unions, and to prepare for an expected new wave of revolutions.

Backed by a majority of the American Communist Party, Lovestone organized a large delegation to go to Moscow to argue in the Comintern that the Stalin line would be a sectarian and ultra-left disaster if applied to U.S. conditions. In consultation with trusted aides in the United States (Jack Stachel and Robert Minor), Lovestone also took measures to keep American Party resources in "safe hands" in the event of a break with the Stalin leadership. Consummate factional infighter though he was, Lovestone was no match for Stalin's political machine. Brutally crushing them in Moscow as "right opportunists" and "American exceptionalists" who were "disloyal" to the Communist International, Stalin mocked: "No one will follow you but your wives and sweethearts." Stachel, Minor, and others of the Lovestoneite majority back in the United States were given the choice: break with Lovestone or break with the Comintern and the USSR. Along with a substantial portion of the delegation to Moscow, the great majority of Communists in the United States (including Stachel and Minor) repudiated Lovestone.

When Lovestone, Wolfe, Gitlow and other unrepentant co-thinkers finally were allowed to leave the USSR, they were able to establish a new organization in 1930 called the Communist Party (Majority Group). This was so far from the truth that the 200 Lovestoneites soon adopted the new name Communist Party Opposition.

William Z. Foster was not considered to be sufficiently trustworthy to represent the Stalinist line in the U.S. Communist leadership. As a result, the Comintern elevated a secondary figure from the Foster caucus, who had recently spent time in Moscow, Earl Browder, to serve as general secretary of the Communist Party of the USA. This appointment was made just as the Great Depression was devastating millions of workers and raising questions about whether the capitalist system was about to collapse. A majority of American Communists, losing patience for continued factional disputes, let alone critiques of the USSR and the Comintern, felt it was time to close ranks behind the leadership of Comrade Stalin, in the face of intensifying economic hardship, the rising tide of fascism, and the shadows of war.

As Peggy Dennis later commented, "in our political naivete . . . we younger comrades did not particularly connect our own internal struggle with that which had raged in the Comintern and the Soviet Communist Party," nor did many U.S. Communists comprehend that the Comintern's interventions into the affairs of the American Communist party were "part of Stalin's consolidation of his leadership within the Soviet party and the international movement, less than five years after Lenin's death." She added, "we

eloquently echoed Stalin's published denunciations of Bukharinism and Trotskyism without even objecting to the fact that we were not allowed to read what Bukharin or Trotsky had said or written."

In the period of ferment and radicalization in the 1930s that was generated by the Great Depression and the threat of fascism, it was not just party members but also radicalizing non-Communists considering various points of view who were drawn to the arguments of the Communist Party's leadership. Listening to a debate between Stalinist V.J. Jerome and Lovestoneite Bertram D. Wolfe, George Blake Charney later recalled: "I was in no position to judge the respective merits of their arguments on Marxism. Both were learned men. In the end I was drawn to the position of the [Stalinist] party because it was positive and forward-looking, whereas Wolfe was carping and negative and offered so little hope at a time when we needed so much."

Mixed Legacies

Despite the drastic curtailment of internal democracy in the Communist Party and the Comintern, matched by the intensification of the brutal authoritarianism of the Stalin regime in the USSR, American Communists of the 1930s threw themselves into a variety of activities to defend the interests of the working class and the oppressed. The injustices that had drawn them to Communism had by no means vanished—and some of them had gotten worse. Organizational efforts and struggles were launched among the ranks of the unemployed—hunger marches, the building of Unemployed Councils, and the Workers Alliance. There were also union struggles—especially when the Con-

One of the most prominent leaders of the Communist Party of the United States from the 1920s to the 1950s, William Z. Foster ran for president in 1924, 1928, and 1932. He is shown here testifying before Congress on November 8, 1945. *(Bettman/Corbis)*

gress of Industrial Organizations (CIO) began organizing millions of mass production workers—in which Communist Party members and sympathizers often provided leadership. Communists played a pioneering and often dramatic role in struggles against racism and in some cases in struggles for women's rights. Struggles were ongoing against fascism, imperialism, and militarism. In the process, Communists made innumerable contributions to culture and consciousness that impacted millions of people throughout the country.

By the late 1930s, nearly 100,000 people were associated with the Communist Party. At the same time, in line with Earl Browder's slogan that "Communism is 20th Century Americanism," the Communists sought to avoid doing anything to alienate pro-capitalist liberals in the New Deal wing of Franklin D. Roosevelt's Democratic Party. This was part of the People's Front orientation, designed by the Stalin leadership of the Comintern to create a broad, multi-class global coalition to block the spread of fascism (especially the variety represented by the Hitler regime that took power in Germany). In the words of Earl Browder, "Roosevelt's programmatic utterances of 1937, when combined with the legislative program of the CIO (his main labor support), provides a People's Front program of an advanced type," adding that "we can completely agree with such non-socialist democrats upon the united defense of democracy under capitalism." Years later, Browder boasted that the Communist Party thereby "rapidly moved out of its extreme leftist sectarianism of 1930 toward the broadest united front tactics of reformism for strictly limited immediate aims. It relegated its revolutionary socialist goals to the ritual of chapel and Sundays on the pattern long followed by the Christian Church. On weekdays it became the most single-minded practical reformist party that America ever produced."

The Trotskyists never attracted more than 2,000 members, sometimes existing in several organizations or even as independent individuals. Despite an often undeserved reputation for sectarianism, they were able to play an honorable role in the labor movement, especially through the impressive leadership they provided in the 1934 Minneapolis general strike. Pockets of working-class militants in various unions and industrial centers, as well as in unemployed and community struggles, continued to do what they could to advance class consciousness and the class struggle, and to keep alive revolutionary Socialist ideas. Trotskyist and Trotskyist-influenced intellectuals, writers, and artists made contributions to American culture, such as: James Burnham, Max Eastman, James T. Farrell, Sidney Hook, Irving Howe, Dwight Macdonald, Mary McCarthy, Philip Rahv, James Rorty, Meyer Schapiro, Edmund Wilson, and others (although some abandoned their left-wing commitments). One of the greatest legacies of the Trotskyists was their consistent anti-Stalinism in which they not only denounced Stalin's crimes, but also insisted that these were alien to Marxism, to the Russian Revolution of 1917, and to the goals and commitments of the early Communist movement. In later years, some also played a significant part in antiracist, antiwar, feminist, and other struggles.

The Lovestoneites have left a more complex legacy. Hoping that the Comintern would recognize them as having been right, they persisted in defending many of Stalin's policies—until by 1937 they recoiled with horror as the bloody purges of the 1930s

made it clear that there was no way back for them. One of their greatest contributions was the magnificent left-wing mural history of the United States painted by the great Mexican revolutionary muralist Diego Rivera at their New Workers School. They also made significant contributions in certain union struggles, including (along with Socialists and "mainstream" Communists) during the sit-down strikes of automobile workers. However, their role in unsavory union factional fights finally destroyed their credibility in the United Auto Workers. On the other hand, a prominent Lovestoneite, the popular Charles ("Sasha") Zimmerman, rose in the leadership of the International Ladies' Garment Workers' Union (ILGWU), and Lovestone became a close associate of ILGWU chieftain David Dubinsky (and eventually a significant figure in the AFL, after Dubinsky assured other AFL leaders that "the son of a bitch converted" to their own anti-Communist outlook). This was after their organization dissolved in 1941, and Lovestone went on to help develop and implement Cold War foreign policy in collaboration with the State Department and Central Intelligence Agency. Bertram Wolfe became an anti-Communist authority on the USSR and State Department employee. Another Lovestoneite, Will Herberg, became a prominent Jewish theologian and conservative intellectual. Ben Gitlow moved even further to the right as an associate of the John Birch Society.

Much of this reaction was related to revulsion over the fact that the Russian Revolution, in which so many idealistic hopes were invested, gave way to the murderous dictatorship of the Stalin regime. This reality (and the defense or denial of the reality) is one of the most negative legacies of American Communism's mainstream. A related problematic legacy was the tendency for Communists in various social struggles to tailor their efforts to harmonize with the dictates of the Stalin regime, sometimes to the detriment of those struggles. In addition, some were drawn into spy networks to assist the "homeland of socialism"—through the Comintern underground apparatus, the Soviet secret service, Soviet military espionage—in its battle against the capitalist enemy. These made up only a very small minority of Communists, and in some cases their stories did not end well. There was, for example, Juliet Stuart Poyntz, who took on trusted "underground" assignments, became disillusioned with Stalinism, and suddenly disappeared (perhaps kidnapped and murdered) in the 1930s. There were Whittaker Chambers and "Red spy queen" Elizabeth Bentley, who were idealistically drawn into "secret work" and then repelled by aspects of what they were doing, causing them to turn on their comrades and become professional witnesses against Communism. Such reactions fed into the anti-Communist hysteria of the Cold War era beginning in the late 1940s and caused many to view American Communism as simply a treasonous conspiracy.

The fact remains that the legacy of American Communism cannot simply be reduced to this negative set of events. Too many were heroically involved in the struggle for the economic betterment of the working class, for racial equality and human rights and against poverty, imperialism and militarism, and fascism. Too many people had made such involvements fundamental commitments of their lives for us to be able to exclude such idealistic impulses from the Communist legacy. People were drawn to this movement because they sought a world in which our economic resources would be democratically controlled and utilized to provide dignity, freedom, and equality for all people. Although many reject this vision as an impossible dream, it endures.

From the 1950s through the 1960s and beyond, many children of Communists (nicknamed "red diaper babies")—while often rejecting the Communist Party—went on to play important roles in struggles for political, economic, and social change. "Most red diaper babies struggle with the need to adapt the socialist values of childhood to capitalist adult reality, to walk a fine line between individual fulfillment and social responsibility," note Judy Kaplan and Linn Shapiro in their anthology *Red Diapers.* Many without such family backgrounds have also looked to retrieve what might be positive from the mixed legacies of U.S. Communism as they struggle to make the world a better place.

Sacco and Vanzetti

On April 15, 1920, in Braintree, Massachusetts, a paymaster and his guard were carrying a factory payroll of $15,776. Two gunmen suddenly fired on them, grabbed the cash, and fled in a nearby automobile. Three weeks later, two friends, Nicola Sacco and Bartolomeo Vanzetti, were arrested for the crime. Thus, the stage was set for the most notorious political trial in the twentieth century.

Their arrest coincided with the "Red-Scare" of 1919–1920, a period in U.S. history immediately following World War I, during which many people feared those labeled as "Reds," "Anarchists," and "foreign-born radical agitators." Neither Sacco nor Vanzetti had a criminal record, but they were recognized by the authorities for their involvement in strikes and antiwar demonstrations and for their close association with the Italian Anarchist Luigi Galleani. Both were committed Anarchist activists. Many liberals and most radicals feel the two men were tried for their political beliefs and not because they committed the robbery.

Trial Beginnings

In addition to the Braintree robbery, Vanzetti was charged with a holdup that had occurred on December 24, 1919, in Bridgewater, Massachusetts. Vanzetti was found guilty of this crime. Vanzetti's witnesses were primarily Italian immigrants who spoke little English, and he did not take the stand in his own defense. For this criminal offense, a crime in which no one was hurt, Vanzetti received a sentence much harsher than usual—ten to fifteen years. This signaled to the two men and their supporters a hostile bias on the part of the authorities that was political in nature and pointed to the need for a new defense strategy in the Braintree trial.

On the advice of the Anarchist militant and editor Carlo Tresca, new legal counsel was brought in—Fred H. Moore, the well-known Socialist lawyer from the West. He had collaborated in many labor and Industrial Workers of the World trials and was especially noted for his important role in the celebrated Joseph Ettor-Arturo Giovannitti case, which came out of the 1912 Lawrence, Massachusetts, textile strike. Moore decided it was no longer possible to defend Sacco and Vanzetti solely against the criminal charges of murder and robbery. Instead he would have them frankly acknowledge their anarchism in court, try to establish that their arrest and prosecution stemmed from their radical activities, and dispute the prosecution's insistence that only hard, nonpolitical evidence had implicated the two men in common crimes. Moore would try to expose the prosecution's hidden motive: its desire to aid the federal and military authorities in suppressing the Italian Anarchist movement to which Sacco and Vanzetti belonged.

Anarchist Roots

By trade, Sacco was a shoe worker and Vanzetti was a fish peddler. Both men were supporters of Galleani's journal *Cronaca Sovversiva*, the principal Italian Anarchist newspaper in the United States, which advocated "propaganda by the deed" (direct action in violent form) and revolutionary violence, including the use of dynamite and assassination. Such activities, they believed, were responses to the overwhelming violence of the state. During World War I, the paper was shut down for its radical views, and its editors, including Galleani, were deported to Italy in 1919 at the war's end.

Like most Anarchists, the followers of Galleani were against the war. In an article entitled "Matricolati!" (Registrants) published in *Cronaca Sovversiva*, Galleani advised his followers to avoid the draft and go underground. Heeding his call, Sacco and Vanzetti left for Mexico. Unable to find work, the two sneaked back across the border in September 1917. After working at a series of labor and construction jobs, Vanzetti

bought a fish cart, knives, and supplies from a friend returning to Italy and became a fish peddler. Sacco continued to earn his living as a shoe worker. He worked in factories and was on good terms with his employers. Sacco was also devoted to his wife Rosina and his son Dante. The family also included a daughter, Alba, who passed away in 1906 when she was barely a month old. Vanzetti never married or had children.

The first Italian Anarchist group formed in 1885 in New York City. One of the precipitating factors in the development of Italian anarchism was the Haymarket Affair of 1886–1887, which began when Chicago police fired into a crowd of striking workers at the McCormick Reaper Works, killing and wounding several men. In response, Anarchist and Socialist labor leaders organized a meeting near Chicago's Haymarket Square, and a riot broke out between police and workingmen, ultimately killing more than half a dozen police officers. By the 1890s, there were Italian Anarchist groups in Boston, Philadelphia, Pittsburgh, Cleveland, Detroit, Chicago, and San Francisco.

As historian Paul Avrich notes in *Anarchist Portraits* (1988), "another important stimulus was the arrival from Italy of a series of distinguished anarchist writers and speakers." Some like Galleani and Tresca made the United States their home. Galleani arrived in the United States in October 1901 at the age of forty. Settling in Paterson, New Jersey, he assumed the editorship of *La Questione Sociale*, the leading Anarchist periodical in the United States. On June 6, 1903, he launched *Cronaca Sovversiva* in Barre, Vermont, among the Italian stone and marble cutters.

Sacco and Vanzetti, like many Italian Anarchists, revered Galleani as a "patriarch of the movement." They considered themselves Anarchist-Communists and were dedicated to social revolution, rejecting the state and private property. Galleani's brand of anarchism appealed to a broad section of the Italian working class, including garment and construction workers, stonecutters, shoe workers, barbers, tailors, and machinists.

Unlike the followers of Tresca who adopted anarcho-syndicalism, Sacco and Vanzetti avoided the unions owing to their suspicion of hierarchical organizations. However, they were participants in strikes, Sacco in Hopedale in 1913 and Vanzetti at Plymouth in 1916. This was the character of the movement to which Sacco and Vanzetti adhered. They subscribed to *Cronaca Sovversiva*, attended political lectures, frequented the concerts and picnics, and acted in Anarchist plays. They took part in demonstrations and agitated during strikes.

Defending Sacco and Vanzetti

From 1920 to 1927, the plight of Sacco and Vanzetti was the primary concern of the Italian Anarchists. They formed the Sacco-Vanzetti Defense Committee in order to raise funds and lecture in defense of their comrades. Other Anarchist ethnic groups—Jewish, German, Russian, and so on—rallied behind the cause. But the Anarchists were not alone. Moore's defense of the two men soon became so openly and energetically political that its scope quickly transcended its local roots. He organized public meetings, solicited the support of labor unions, contacted international organizations, initiated new investigations, and distributed tens of thousands of defense pamphlets throughout the United States and the world. Much to the chagrin of some Anarchist comrades, Moore would even enlist the aid of the Italian government in the defense of Sacco and Vanzetti. The Communist International urged all Communists, Socialists, Anarchists, and trade unions to organize efforts to rescue Sacco and Vanzetti. Moore's aggressive strategy transformed a little-known case into a cause celebre.

Leftists and liberals accepted Moore's assertion that Sacco and Vanzetti were being tried for their political beliefs. Moore urged that the prosecution was not using strictly nonpolitical evidence and that their case was based on facts that had no bearing on the murders. However, Moore's attempt to convince the jury that the goal of the prosecution was suppressing the Italian Anarchist movement fell on deaf ears. Following a six-week bitter trial, Sacco and Vanzetti were found guilty of robbery and murder on July 14, 1921.

But the guilty verdict was hardly the last page in their legal battle. It would drag on until 1927 during which time there were many motions, appeals, and petitions for a new trial on various court levels. The motions contained evidence of perjury and comments by Judge Webster Thayer referring to the two men as "those anarchist bastards."

After the failure of Moore's strategy, Sacco and Vanzetti hired a respected Boston lawyer, William Thompson. Thompson abandoned Moore's political approach and engaged strictly in jurisprudence. Nonetheless, the political dimensions of the case continued to be voiced by Anarchists, Socialists, liberals, and trade unionists.

Demonstrations took place in the major cities of

Despite a paucity of evidence, anarchists Bartolomeo Vanzetti (center) and Nicola Sacco (right) were convicted of murder in 1921. Many charged that they were really tried for their extreme political beliefs, and liberals and radicals worldwide mobilized in their defense. They were executed in 1927. *(Brown Brothers)*

the United States and in France, Italy, Switzerland, Belgium, Spain, Portugal, and Scandinavia. Thousands of French police troops were needed to prevent a mob from besieging the American embassy in Paris. Scientist Albert Einstein, English novelist H.G. Wells, English labor leader Thomas Mann, and even the Vatican were strong Sacco and Vanzetti supporters who protested their conviction.

Ultimately, all the efforts were to no avail. Sacco and Vanzetti were executed on August 23, 1927, a date that became a watershed in twentieth-century American history. Serious doubts still surround the verdict. Indeed, no other convicted murderers have received a celebrated place in the *Dictionary of American Biography*. Furthermore, the Sacco-Vanzetti case was inspiration for a few movies, several poems, six plays, and nine novels. As historian Robert D'Attilio notes, "It became the last of a long train of events that had driven any sense of utopian vision out of American life."

Unemployment Movement

Following the collapse of the economy after the stock market crash of 1929, Americans confronted the specter of steadily increasing unemployment that robbed them of their jobs and led many to abandon the voluntaristic assumptions of laissez-faire economics. As the ranks of the jobless swelled with the advent of widespread unemployment, large numbers of displaced workers turned to left-led voluntary associations and political organizations for leadership in the struggle to meet the most basic of human needs. The result was the development of mass organizations that displayed the characteristic features of social movements, including evidence of spontaneity, grassroots pressure, and democratic control. As unemployed activism escalated, various political organizations embraced the cause of the jobless and worked to advance partisan programs through engagement in the unemployed movement.

Communist Party Councils

The first group to offer meaningful assistance to the unemployed was the Communist Party (CP), which had long championed the cause of the dispossessed in the American underclass. Always aggressive in their search for adherents, party organizers actively recruited on the breadlines, at the plant gates, and in relief offices in an effort to broaden their support base among the jobless. One of the earliest mass actions occurred on March 6, 1930, when in a coordinated nationwide demonstration hundreds of thousands filled the streets of the major cities and demanded government action to meet the needs of dislocated workers and their families. Even CP activists were stunned by the size and intensity of the International Unemployment Day demonstrations. Success fueled the party's determination to mount a mass movement by creating a national organization to promote the interests of the unemployed.

The result was the establishment in summer 1930 of the Unemployed Councils of the United States, a body intended to advance the agenda of the jobless and link them with employed workers in the struggle to improve the lives and status of impoverished workers and their families. In Detroit, New York, and Chicago, militant organizations carried out jobless demonstrations, eviction protests, and welfare office mediation on behalf of relief re-

This gripping image conveys both the depth of the Depression and the determination of the unemployed to gain relief. *(Brown Brothers)*

Unemployed veterans of World War I descended on Washington, D.C., in the spring of 1932 to demand that Congress authorize immediate cash payments, or "bonuses," as compensation for their military service. With no place to stay, some of the bonus marchers camped out in front of the Capitol Building on July 13. Two weeks later, federal troops forcibly evicted some 2,000 veterans, killing two. *(Brown Brothers)*

cipients. Although the Councils were loosely coordinated by the Communist Party's designated leaders, one of the greatest strengths of these organizations lay in the substantial independent initiative exercised by the local Councils and their leaders. This decentralization enabled local organizations to move quickly and decisively in response to emergency situations such as evictions or denials of public assistance. Although there is little evidence of mass conversion to Communist Party ideology, it is clear that the jobless knew that at the local level it was the Councils and their leaders who provided the most reliable support when they were confronted by personal crises. Consequently, party organizers enjoyed a level of respect and acceptance rarely achieved in post-Depression years.

Between 1929 and 1933, the Unemployed Councils worked to raise public and political consciousness of their program through a series of highly publicized national events, such as the national hunger marches of 1931, 1932, and 1933, the Bonus March of 1932, and selected efforts to establish the unity of employed and unemployed workers in strike situations. Led by the tireless Communist organizer Herbert Benjamin, the Councils worked to advance a national agenda that featured a demand for unemployment insurance, greater federal relief allocations, and public employment programs. Before 1934, the Unemployed Councils were at the forefront of the national unemployed movement, in part due to their persistence in local organizing and commitment to short-term goals. Their revolutionary rhetoric drew a tepid response, but their success in addressing human needs drew the support and gratitude of the jobless and dispossessed.

The League for Industrial Democracy

So successful were the Communists in the early Depression years that other radical groups determined to enter the field. Struggling to break the hold of the Socialist old guard, Socialist Party (SP) militants moved to compete with the Councils for the loyalty and allegiance of the unemployed. These efforts began with the establishment of the Wisconsin Workers Committee and the Chicago Workers Committee on Unemployment. Active as early as 1932, the Illinois group expressed the spirit of a younger element in the SP that grew out of the League for Industrial Democracy (LID) and dedicated itself to organizing the unorganized rather than engaging in doctrinal debates. The LID Socialists, with the support of the party's national executive committee, moved to contest CP domination of the unemployed movement by employing some of the same techniques used by their adversaries. By emphasizing grassroots organizing at the local level, the Workers Committee competed with the Councils and by 1934 had become successful advocates for the jobless and established a firm foothold in such places as Chicago, Milwaukee, and New York. While the Unemployed Councils were declining in influence, the Socialist expression of the unemployed movement demonstrated remarkable growth that culminated in the organization of the SP-sponsored Workers Alliance of America at the national level in 1935. The Alliance, under the aggressive leadership of New Yorker David Lasser, soon came to dominate the evolving mass movement.

Musteites and the National Unemployed League

Still another entry into the field of unemployed organizing was the National Unemployed League, which grew rapidly in Pennsylvania, West Virginia, and Ohio. Led by the radical A. J. Muste and his followers, many of them associated with the Brookwood Labor College. This organization included Socialists, Communists, and Trotskyites, and often members of the Conference for Progressive Labor Action, which aspired to create an independent worker movement on the left capable of competing with the American Federation of Labor. Combining forces with the Seattle-based self-help cooperative known as the Unemployed Citizens League, the Musteites and their allies came to be called the National Unemployed Leagues. The organization was strongest in the coal-mining and steel-producing areas of the East and Midwest. Formally established in 1933 at a national conference in Columbus, Ohio, the League experienced disagreements between the advocates of self-help cooperative programs and radicals determined to engage in labor actions and high-profile demonstrations. Perhaps the most important success for the Musteites occurred in the Toledo Auto-Lite strike of 1934, when the Lucas County Unemployed Leagues joined hands with striking workers in a dramatic illustration of unity between employed and jobless workers, thus realizing the early dream of the Unemployed Councils.

By 1935, the Workers Alliance of America had grown into a major national organization with a membership of 400,000 jobless workers in eighteen states. Truly national in scope, the Alliance had eclipsed the Unemployed Councils and enhanced the prestige of the Socialist Party among the nation's unemployed. In early 1936, the stage was set for the next major development in the unfolding unemployed movement. By this time, the Communist Party had entered the Popular Front period, during which it endorsed cooperation with the non-Communist left, including Socialists and New Deal Democrats. The change in approach facilitated a new openness to the idea of a unified unemployed movement, which ended in the merger of the Councils, Leagues, and the Workers Alliance in 1936. Although the majority of the Alliance's restructured national executive board was non-Communist and Lasser retained his position as president, Benjamin assumed the important position of national executive secretary.

These changes coincided with the launching of the New Deal's ambitious program for the unemployed under the Emergency Relief Appropriation Act of 1935, which created the Works Progress Administration (WPA). The new federal work relief program was a direct stimulus to increased militancy and organizational activity among Workers Alliance participants. The burgeoning federal work relief program provided the Alliance with a fertile field for organizational growth, as the concentration of workers on the projects facilitated recruitment. With this expansion, the unemployed movement entered a new phase characterized by an emphasis on lobbying at the national level for favorable legislation and high-profile intervention on behalf of the jobless. The practical consequence was that from 1936 on, the Workers Alliance came to function more as a legitimate labor union for its unemployed members and less as an advocate for relief recipients and their families. Lasser and Benjamin interacted easily with Roosevelt administration officials, who came to regard them as representatives of workers on government projects.

As a result of this gradual integration into the New Deal structure, the unemployed movement was eventually coopted by the forces of liberalism, though radicals like Benjamin continued to exercise strong influence on its policies and direction. Similarly, many of the Alliance's most gifted organizers were drawn into the Congress of Industrial Organizations' (CIO) struggle to organize the unorganized in the mass industries such as steel, auto, and rubber. Led by the United Automobile Workers (UAW), some CIO unions moved to incorporate unemployed organizing into the fabric of the international unions. Their goal was to maintain Depression-era membership and educate the jobless as a bulwark against their use as strikebreaking pawns in the labor-management struggle. As a result of such strategies, the unemployed movement functioned as a training ground for union organizers who became the shock troops of the industrial union movement of the late 1930s and early 1940s.

As the economy revived with the advent of World War II, some leaders of the unemployed movement reinvented themselves as advocates for the "unemployables" of the labor force: women, youth, and the handicapped. From Michigan, for example, the UAW Welfare Department exerted political pressure in Washington in hopes of converting WPA into an agency that might meet the needs of these traditionally ignored elements in the workforce. Simultaneously, the smaller and politically isolated Workers Alliance devoted its energies more and more to the

chronically unemployed and long-term relief recipients. The Alliance's shrinking membership base and the cumulative impact of Red-baiting attacks doomed the organization to obscurity in an era marked by an expanding economy.

By 1939, economic recovery and renewed employment opportunity had begun to undermine the unemployed movement as a vibrant social force. The movement was also damaged by sharpened allegations of Communist infiltration as both the House Committee on Un-American Activities and the Committee on Appropriations took aim at the Workers Alliance. Charges of Communist influence, cooptation by New Deal liberalism, the reality of economic revival, engagement in the mainstream union movement, shrinkage of WPA employment, and the onset of war all combined to fatally weaken a movement that had played a key role in sheltering the jobless and the hard core "unemployables" in capitalism's darkest hour.

Conclusion

Although the movement faded with the economic upturn, it had contributed in significant ways to the advancement of Depression victims' interests. Advocacy efforts for welfare recipients and public works employees had filled an important gap in the social safety net by shielding workers from economic disaster. Eviction reversals, benefit increases, counseling, and assistance in establishing entitlement were among the concrete services the movement provided for the discards of Depression America. Pressure group activity and lobbying also aided in the enactment of unemployment compensation legislation and complemented liberal efforts to expand WPA programs and other public employment opportunities in the troubled 1930s. Moreover, one of the key achievements of the unemployed movement was certainly its role as a school for unionism, in which the jobless were reminded of the common interests shared by employed and unemployed workers as part of the working class.

When the unemployed refused to cross picket lines and took their organizing experiences into the nation's factories upon reemployment, they often became dedicated union activists who brought industrial unionism to a receptive workforce. Under radical leadership, the unemployed movement had demonstrated how collective action could meet the needs of individuals who committed themselves to participation in a wider social community of human interest. In the process, grassroots unemployed organizers served the most immediate interests of the jobless by creating a web of organizations and activists that constituted an influential mass movement rooted in unprecedented, if transitory, class solidarity

Unemployed Councils

The unemployed movements of the 1930s were a powerful response to an economic disaster that helped to give hope and sustenance to unemployed people and their families throughout much of the United States. It was at one and the same time a national movement and a highly localized movement. In addition to providing immediate assistance to many thousands of people, it helped to create significant pressure on local, state, and national governments to provide relief, including substantial social legislation, for those afflicted by unemployment and poverty. It also helped to give significant numbers of people political experience and organizational training that would be utilized in other struggles—most dramatically, the organizing drives and strikes of mass production workers during the 1930s and 1940s spearheaded by the Congress of Industrial Organizations (CIO). It was an important instance in which left-wing organizations in the United States played a vital role and achieved mass influence.

The Great Depression

The stock market crash in October 1929 signaled the beginning of the Great Depression that afflicted the United States and the world economy for a decade. A salient feature of the economic downturn, of course, was massive unemployment. The number of those who were jobless rose from 492,000 at the time of the crash to 4,065,000 three months later in January 1930. By September of 1930, the number passed 5 million, and in November, 6 million. In January 1931, it was up to 8 million, and by October, it was more than 9 million. It soared to over 12 million by 1933, and before the year was over there were more than 15 million unemployed.

Joblessness led to an inability of millions of workers and their families to secure income for food, clothing, shelter, as well as fuel and other necessities. For many, the consequences were hunger, utility shutoffs, and foreclosures on homes with unpaid mortgages or apartments with unpaid rents. Individual people and individual families dealt with these problems as best they could—seeking help from other family members, relying on charity, asking for food and odd jobs wherever they might be found, and in some cases building little shacks for shelter outside of city limits (in some instances these mushroomed into shantytowns called "Hoovervilles" in bitter tribute to President Herbert Hoover, with his false promise that "prosperity is just around the corner").

The Early Unemployed Movement

The unemployed movement was a response to these circumstances—and to a realization by many people that these were common problems that could be adequately solved only through collective action. Much of this movement took the form of collective self-help—people working together to secure food, clothing, shelter, and fuel through a variety of methods: raids on grocery stores, negotiations with farmers to gather crops that would otherwise be wasted, digging and operating illegal "bootleg" coal mines, and setting up increasingly complex bartering systems (selling labor for food, selling food for clothes, selling clothes for food, selling food for haircuts, etc.).

The most effective expressions of the movement were organized by left-wing organizations. The first to take dramatic action was the Communist Party, affiliated with the Communist International, which was able to point out that the Union of Soviet Socialist Republics, under Josef Stalin, was the only country not suffering from this capitalist economic collapse. The Communist Party organized a network of Unemployed Councils that came together as the Unemployed Council of the USA in 1930 and was reorganized in 1934 as the national Unemployed Council.

Some of the most innovative efforts were carried

Americans thrown out of work by the Great Depression, such as these in Philadelphia, organized Unemployed Councils throughout the country.

out by an offshoot of Brookwood Labor College, the Conference for Progressive Labor Action (CPLA), led by A.J. Muste (hence sometimes referred to as "the Musteites"). The CPLA later became the American Workers Party and then merged with dissident Communists influenced by the ideas of Russian revolutionary Leon Trotsky (known as Trotskyists) into the Workers Party of the United States. The Communist Party organized the Unemployed Councils of the United States of America. The Musteites organized what were generally called Unemployed Leagues, culminating in the formation of the National Unemployed Leagues in 1933.

The more moderate Socialist Party—particularly as radical young activists entered its ranks under the impact of the Depression—soon played a prominent role in a number of areas. Socialist-led formations had various names (the Chicago Workers Committee, the People's Unemployed League of Baltimore, the Unemployed Workers League, etc.) but finally merged with each other (and with the Association of the Unemployed, led by dissident Communists associated with Jay Lovestone) to form the Workers' Alliance of America in 1935.

Historians have sometimes been inclined to dismiss such organizational divisions in the unemployed movement as reflecting sectarian "turf battles" between competing left-wing groups. While this sort of

thing was not absent, there were more substantial reasons for the divisions.

In the early 1930s, the Communist Party was guided by the view of Stalin and others that the revolutionary period initiated by the Russian Revolution of 1917 had in the 1920s given way to a second period of capitalist stabilization and prosperity. Now, the Communists maintained, the Depression signaled *a third period* in which capitalism would be overthrown under the leadership of Communist Parties throughout the world. This third-period Communism was often characterized by a recklessly "revolutionary" attitude and a refusal to work in coalition with other left-wing organizations—qualities that affected much Communist work in the unemployed movement.

While the Unemployed Councils developed a reputation for being militantly confrontational, for example, in bodily blocking evictions, the Socialist Party often involved itself in efforts to work with local relief authorities to secure financial assistance for threatened families. The Unemployed Leagues effectively blended both approaches and also often sought to root their efforts in local self-help efforts and to generate revolutionary consciousness among participants. They did so not with appeals to the Russian Revolution, but with references to American revolutionary traditions (such as the frequent use of the "Don't Tread on Me" flag of 1776).

Dramatic Action

Various components of the unemployed movement engaged in a number of dramatic actions. The Unemployed Councils organized massive protests on March 6, 1930, turning out perhaps half a million nationwide, in about twenty cities: 100,000 each in New York City and Detroit, about 50,000 each in Chicago and Boston, 30,000 in Philadelphia, 25,000 in Cleveland, 20,000 apiece in Pittsburgh and Youngstown, and so on. In many cases, the police attacked the demonstrations, arresting more than 200 and injuring at least 200 more ("Communists have no Constitutional rights," insisted the police commissioner of Los Angeles)—though a number of city governments also pledged aid to the unemployed.

Hunger marches were organized in dozens of cities in the following year. In 1931 and again in 1932, the Unemployed Councils organized hunger marches in Washington, D.C.—the first consisting of less than 1,700 delegates from various cities, and the second with 3,000 delegates, who were attacked by the police.

National marches on the nation's capital were also staged by less radical ideologues. Father James R. Cox, a Catholic priest from Pittsburgh, led a 1932 hunger march of 12,000. Later that year, 22,000 unemployed veterans from World War I converged on Washington, setting up a shantytown and calling on the government for early payment of a $1,000 bonus that had been promised to each of them by law. The law stipulated that the bonus would be paid in 1945, but the veterans argued that they needed it now. Eventually, President Herbert Hoover had troops forcibly disperse the veterans and burn down their shanties. "The Bonus march in the summer of 1932 was one of the most instructive things that ever happened in this country," commented novelist John Dos Passos. "Both its failures and its successes cast light on the realities of popular government under the great monopolies." (In the radical high-tide of 1936—overriding the veto of President Franklin Roosevelt—Congress would pass the Patman Bill, which finally gave the veterans their bonus.)

Perhaps more important for the lives of those suffering from the Depression were the activities taking place in the neighborhoods. Richard Boyer and Herbert Morais have offered a composite anecdote that gives a sense of a more localized dramatic action, of friends and neighbors who came to the aid of unemployed Peter Grossup and his wife, when they were being evicted from their house, after missing mortgage payments, by five deputies from the sheriff's department:

> A tall Negro, apparently in charge, stood next to Mr. Flaherty [his neighbor]. . . . Mr. Flaherty pulled at him again and said, "We're from the Unemployed Council. We want to help."
>
> "Well, my God," shrieked Mr. Grossup, "if you want [to] help, do something then!"
>
> The tall Negro looked briefly at the five deputies on the porch and then at his thirty unemployed.
>
> "Move it back," he said.
>
> In an instant before Mr. Grossup's very eyes all of his prized possessions, his easy chair, even the big refrigerator, the bed posts, the pictures, everything was streaming back into his home. The neighbors began grabbing pots and pans and mattresses and stumbling a little and laughing wildly and calling out in excited tones, clumping up onto the porch and into the house. There was a little scuffle once on the porch with the deputies but more and more neighbors were helping and they just pressed in.
>
> Mr. Grossup never knew how it all happened. It was a happy blur. He had his home again. He had strength. He had friends. . . .

Such activities had effects on a number of levels. "Social workers everywhere told me that without street demonstrations and hunger marches of the Unemployed Councils no relief whatever would have been provided in some communities," according to one reporter, "while in others even less help than that which had been extended would have been forthcoming." One of the leaders of the Unemployed Leagues, A.J. Muste, later described such struggles as "providing an outlet to the unemployed who were no longer passively submitting to their lot, actually ameliorating their condition somewhat, and contributing to the channeling of dissent which, among other things, led to the election of Roosevelt in 1932."

Thousands of protesters—mobilized by Unemployed Councils, Unemployed Leagues, and the Workers' Alliance—converged on state capitols at various times, putting pressure on the legislators. One of the most dramatic protests was a 1936 sit-in at the New Jersey State Legislature, staged by the Workers' Alliance, with unemployed workers occupying the seats normally filled by politicians. They made humorous speeches, "passed" legislation to aid the unemployed, and attracted considerable media attention. The Workers' Alliance issued a pamphlet describing the event by a young militant named George Breitman, who expressed the views of many who were radicalized in this period:

> The interests of the ruling, the boss class, are opposite to those of the exploited, the ruling class; therefore the workers can expect nothing but betrayal from the representatives of the ruling class, their politicians, and must be prepared to fight them for everything they want.

One of the most dramatic developments involved the militant Toledo Auto-Lite Strike in 1934, in which the Lucus County Unemployed League mobilized masses of unemployed workers to join in actively supporting the embattled workers, helping them to win their strike. But people demonstrated loyalty to the radical organizations of the unemployed because of the practical efforts described by Ernest Rice McKinney, a black leader of the Unemployed Leagues:

> We actually got them placed on relief, we actually kept them on relief, we fought the relief organization on behalf of the unemployed very concretely. We got food orders for them, we got houses for them to live in, we got clothing for them. We put their furniture back in the house when it was set out on the street. We actually turned their gas on when it had been turned off. We wired their houses for electricity when the current had been cut off. We did very concrete things.

Unity and Decline

By 1936, the various left-wing currents seemed to be converging sufficiently to facilitate the unification of the major components of the unemployed movement. After Musteites merged with Trotskyists in 1935, and then the combined organization began to gravitate toward the radicalized Socialist Party in 1936, the Unemployed Leagues decided to merge into the Workers' Alliance. As the Communist Party shifted away from its earlier "third-period" ultra-leftism toward favoring united-front efforts with other left-wing and even liberal currents, the Unemployed Councils also merged into the Workers' Alliance, with Socialist David Lasser and Communist Herbert Benjamin sharing the leadership of the unified movement.

The reasons for unification were also related to larger developments. At the beginning of the Depression, people responded in very personalized ways, and as individual responses were transformed into collective action, the targets were initially local relief agencies, landlords, and city governments—then state governments. The business and laissez-faire orientation of the national government under Herbert Hoover made it an ideal target for angry protests, but not a likely source of assistance. By the second year of Franklin D. Roosevelt's "New Deal" in 1934, however, national pressure on the policies of the federal government would have greater impact.

Roosevelt initiated a number of important programs that helped the unemployed. A Public Workers Administration (PWA) received billions of dollars in the course of the Depression. The Civilian Conservation Corps (CCC) was established in 1933, and over a nine-year period it employed a total of 2.5 million young men (though only 300,000 to 500,000 at any one time)—living in rural camps, planting millions of trees, fighting hundreds of forest fires, building 42,000 dams, creating hundreds of parks and public camp sites and thousands of miles of hiking trails, laying 45,000 miles of telephone lines. Even more ambitious was the Works Progress Administration (WPA), established in 1935 and employing as many as 2 million men and women at any one time (though drastically fewer before it went out of existence in the early 1940s. In addition to manual workers (building roads, bridges, schools, swimming pools, parks and post offices), the WPA employed clerical workers, teachers,

writers, artists, musicians, and others. Of course, there were other forms of government assistance as well; by 1938, a total of 6,641,000 households (representing 20,581,000 individuals, about 20 percent of the population) were receiving some form of public assistance from local, state, and federal agencies, but of these about one-third were on WPA.

In addition to pushing for such programs as these (and for even greater funding to help expand them), the Workers' Alliance, as had the various earlier groups, fought hard for other legislation, including Social Security and unemployment insurance. More than this, the Workers' Alliance organized WPA and CCC workers, functioning as a union of federal employees, struggling for and even going on strike for improved working conditions, for back pay, and for increased pay when hours were increased. By 1938, it claimed a membership of 800,000.

A weakness of the Workers' Alliance, over time, was its increasingly close relationship with, and even growing dependency on, the Roosevelt administration. This relationship may have been understandable given some of the New Deal policies, and it was also related to the pro-Roosevelt shift in Communist Party perspectives, as its united-front orientation evolved into what the Communist International hailed as the People's Front. This emphasized that—in the face of Hitler's aggressive policies toward the USSR and other countries—the choice was not between capitalism and socialism but instead "between bourgeois democracy and fascism," and that Roosevelt's programs (major social reforms in the United States and friendly relations with the USSR) represented, as Communist leader Earl Browder put it, "a People's Front program of an advanced type."

When Roosevelt began to slash New Deal programs in the late 1930s, shifting toward preparations for World War II, the Workers' Alliance was not in a position to provide an effective challenge. Moreover, when the Communist Party defended the September 1939 Hitler-Stalin Non-Aggression Pact (which shocked many on the left), there was an eruption of sharp Socialist-Communist conflict within the Workers' Alliance, culminating in the angry resignation of Lasser and other Socialists.

The unemployed movement had been significantly weakened by other factors as well. There were built-in stabilities. Unemployment is a difficult and demoralizing situation, often making it difficult to sustain ongoing political activity. The most energetic and highly motivated individuals in the unemployed movement will generally seek to end their unemployment if possible through obtaining good jobs in the private sector—and once they do that, they normally leave the unemployed movement. The decisive factor, of course, was that the Depression came to an end with U.S. preparations for World War II, and the evaporation of unemployment naturally brought the evaporation of the unemployed movement.

Nonetheless, the unemployed movements of the 1930s had an enduring impact in more than one way. Hundreds of thousands of people throughout the country benefited from direct contact with these movements, and millions benefited from their successful campaigns for relief to the unemployed. Countless numbers of people crossed racial, ethnic, and religious barriers to join in a common struggle that benefited all—and this had a powerful impact on the consciousness of many. The political education and experience gained by participants was also felt in innumerable ways—particularly among mass production workers who returned to work and helped build powerful industrial unions of the CIO, but also among those who would struggle for civil rights and a variety of social reforms in future years.

Strikes of 1934

The strikes of 1934—particularly those in Toledo, Minneapolis, and San Francisco—were a turning point in the revitalization of the U.S. labor movement, opening the way to the dramatic upsurge through which millions of industrial workers, and others as well, joined the ranks of organized labor. Through tireless organizing efforts and militant strikes, these workers went on to bring dramatic improvements to the quality of life of the U.S. working class and to change the face of the American political scene.

The early years of the Great Depression found the organized labor movement at a low point after a decade of decline during the 1920s. Through business assaults (supported by the government), union membership declined from 5 million in 1920 to 3.5 million in 1923, with the membership of the American Federation of Labor (AFL) remaining steady at just under 3 million throughout the decade. Labor journalist Edward Levinson commented that "from 1923 to 1933 was the Federation's period of sterility." AFL leaders tended to emphasize their respectability, their opposition to all forms of "radicalism," and their desire to contribute to the "efficiency" of the business economy. More than this, they tended to dismiss the possibility of organizing the majority of unskilled and semiskilled mass production workers, favoring craft unions of skilled workers. Critics denounced the AFL as the "American Separation of Labor" because, ignoring the mass of unorganized workers, it focused on the separate jurisdictions and the various jurisdictional disputes of the craft unions. Nor did they put forward any vision for dealing with the Great Depression, which began in 1929, that was significantly different from that of the conservative Republican president, Herbert Hoover.

The massive unemployment dramatically contributed to the further erosion of AFL membership, which sagged to 2 million. Employers launched an assault on the wages and working conditions of those workers still "lucky enough to have jobs"—and the only significant labor battles of the early Depression years were those engaged in by unemployed workers, led by the political radicals who were despised by the AFL chieftains.

Elements in the labor movement—ranging from dissidents associated with Brookwood Labor College to John L. Lewis, the relatively conservative (but shrewd) autocrat of the United Mine Workers of America—had been pressing for the AFL to shift to a more inclusive, active, and bold orientation required to match the changing times. The explosions of 1934 would provide them with irrefutable arguments.

Militant Upsurge

In Minneapolis, Vincent Raymond Dunne and other dissident Communist followers of Leon Trotsky (who were opposed to Josef Stalin's dictatorship, which had taken over in the decade following the 1917 Russian Revolution) led thousands of Teamsters and others to victory through a militant general strike that used bold new tactics. In San Francisco, mainstream Communists allied with Harry Bridges led West Coast longshoremen to a partial victory after a hard-fought general strike. In Ohio, Toledo Auto-Lite workers, led by A.J. Muste and his Socialist followers in the American Workers Party, won a similar victory.

The Toledo Auto-Lite Strike began on February 23 and stretched to June 4. The Minneapolis Teamsters strikes came in three phases: a strike of coal-yard workers, February 7–9, which established Local 574 of the International Brotherhood of Teamsters, which went on to wage citywide strikes from May 15 to May 25 and July 16 to August 22. The San Francisco longshoremen's strike erupted on May 9 and was settled on July 31. There was a labor upsurge throughout the country during the year, with gains being made by mine workers, garment workers, clothing workers, and others.

Most dramatic was a national textile workers strike lasting from September 1 to September 22 under the leadership of the United Textile Workers; this strike was especially notable for mobilizing thousands of hard-pressed workers throughout the South who displayed remarkable determination and courage. But with minimal strike funds and illusions that the administration of Franklin D. Roosevelt would support them, they could not withstand the brutal and violent repression (sixteen workers were killed and many others were wounded) orchestrated by powerful mill owners and their political friends. Unlike so many of the other battles of 1934, the national textile strike went down to bitter defeat (15,000 workers were fired and blacklisted), setting back the cause of southern labor for many years to come.

Yet the balance of power in the labor struggles of 1934 tilted decisively in labor's favor. The strikes that proved to be decisive were those of Toledo, Minneapolis, and San Francisco.

Common Patterns

As outlined by A.J. Muste, the three struggles shared several key elements.

> The methods employed in the Auto-Lite strike—calm defiance of injunctions, cooperation between unemployed organizations and unions, dramatization of the strike issue to bring the masses out to observe and participate in picketing, the threat of a local general strike by the city central body, persistent effort by groups of advanced workers with a revolutionary outlook but a realistic union policy—brought the Auto-Lite strike to an end with a partial victory for the union. Before a year passed, these methods had led to the complete unionization of the Auto-Lite plant and of the entire auto parts industry in Toledo. In other cities and industries these same methods, in many cases applied by workers consciously following the Toledo example, brought complete or partial victory in a great series of struggles which made the year 1934 one of the most notable in the history of the American working class.

Of special importance were the left-wing groups that helped to provide, influence, and back up the capable people with fiercely radical ideas who led the struggles. "The dynamic intervention of a revolutionary workers organization, the American Workers Party, seemed to have been required before that outcome could be achieved," noted Muste's comrade, strike leader Louis Budenz. "The officials in the [AFL-sponsored] Federal Automobile Workers Union would have lost the strike if left to their own resources."

"Our policy was to organize and build strong unions so workers could have something to say about their own lives and assist in changing the present order into a socialist society," V.R. Dunne matter-of-factly explained when he spoke of his efforts in leading workers of his hometown to victory. "Probably four or five hundred workers in Minneapolis knew 'Ray' personally," journalist Charles Walker later commented. "They formed their own opinions—that he was honest, intelligent, and selfless, and a damn good organizer for the truck drivers' union to have. They had always known him to be a Red; that was no news."

In addition to the basic methods Muste described from the Toledo experience, innovations in the Minneapolis strikes included: the use of "flying squadrons" (roving pickets utilizing automobiles and directed via radio from a central command point); the establishment of a strike headquarters that would include a commissary to help feed strikers and their families, and a hospital; the development of a women's auxiliary to facilitate involvement in the strike of wives, sisters, mothers, and sweethearts (among others) in the multiple activities and tasks connected with the struggle; the production of a fairly professional daily strike newspaper to tell the strikers' side of the story, *The Organizer,* which was full of information and humor.

On the West Coast, Harry Bridges, leader of the radicalized International Longshore and Warehouseman's Union that emerged from the San Francisco strike, did not hesitate in expressing the opinion that "the capitalistic form of society . . . means the exploitation of a lot of people for a profit and a complete disregard of their interests for that profit, [and] I haven't much use for that." Relying on a substantial core of left-wing activists (with the Communist Party in particular committing its newspaper, legal and other professional assistance, and its substantial cadres to the struggle), Bridges was able to mobilize a powerful force capable of doing battle with the immense power deployed by West Coast business interests.

As in Toledo and Minneapolis, there was a need for mass picketing, and the willingness to engage in pitched battles with company thugs and the forces of "law and order" that were defending the rights of employers to break unions resulted in casualties on both sides. In all three cases, the National Guard was

brought in, and martial law was declared. In San Francisco, the deaths of two strikers occasioned a call for a massive funeral march—"a stupendous and reverent procession that astounded the city," wrote the *San Francisco Chronicle,* as thousands of union members marched to honor the martyrs and their cause. And as with the other two key strikes, the entire labor movement was drawn into the struggle, largely through rank-and-file pressure, through a general strike that brought the city to a standstill.

In Toledo, Minneapolis, and San Francisco, the strikes ended with compromise settlements and partial victories. But in each case, this decisively shifted the balance of power and provided the essential foothold through which more gains were rapidly achieved. Each city soon attained the status of strong "union town."

Paving the Way

The 1934 strikes not only inspired workers in many other areas to go and do likewise, but it convinced certain key AFL figures—John L. Lewis of the United Mine Workers, Sidney Hillman of the Amalgamated Clothing Workers, David Dubinsky of the International Ladies' Garment Workers' Union, and others—that it was time to form a Committee for Industrial Organization (CIO, which later formed a separate Congress of Industrial Organizations). This soon resulted in a decisive break with the more conservative leadership of the AFL.

Under the CIO banner, a number of powerful new industrial unions came into existence, representing auto workers, steelworkers, electrical workers, rubber workers, longshore and maritime workers, transit workers, and many more. These unions were built, in large measure, by following the example and utilizing the techniques associated with the 1934 victories. The AFL leadership responded by shifting away from its outright opposition to industrial unionism. By 1937, the CIO had 1.5 million members, and the AFL had grown to 2.5 million. Both federations would continue to grow through the 1940s.

This not only brought immediate and tangible gains to the workers who won union recognition and consequent improvements in working conditions and living standards, but it also created an organized force that pushed many politicians (including President Roosevelt) to adopt pro-labor policies. As a result, the balance of power in U.S. politics would be changed for many years to come.

Brookwood Labor College

Brookwood Labor College, one of the outstanding educational institutions in the United States, played an essential part in the training of labor activists—intellectually and organizationally—who revitalized the labor movement through the creation of the Congress of Industrial Organizations (CIO) in the 1930s. Established in Katonah, New York, in 1921, it was animated by the tension between an institutionalized union movement functioning as part of a capitalist economy and the vision of democratic and militant workers' struggles that would create a future free from oppression and exploitation. The tension intensified and culminated in fissures among the school's founders and faculty, and finally in Brookwood's closing in 1937.

Workers' Education and Brookwood's Beginnings

In the wake of the radicalization that issued from the disillusionment over World War I and the hopes generated by the Russian Revolution, many left-wing trade unionists and radical educators in the United States—in part influenced by workers' education efforts in England—moved to establish "labor colleges" across the United States. In 1921, a Workers Education Bureau was created to help coordinate such efforts, and its first president was James Maurer, who explained that "the underlying purpose of workers' education is the desire for a better social order . . . and the ultimate liberation of the working masses." He urged that it not be utilized to help students rise out of the working class, but rather that it help them to "serve the labor movement in particular and society in general."

Some workers' education efforts took the form of evening classes sponsored by unions and central labor councils, whereas others involved summer schools, such as the Bryn Mawr Summer School for Women or the Wisconsin School for Workers (affiliated with the University of Wisconsin). A third form consisted of residential labor schools, of which Brookwood Labor College was the most prominent.

At the end of World War I, well-to-do pacifists William and Helen Fincke, deeply influenced by Walter Rauschenbusch's Christian Socialist Social Gospel perspectives and by John Dewey's approach to progressive education, had sought to establish a school for working-class children in Westchester County, on a beautiful wooded estate about forty miles from New York City. Concluding (in consultation with their close friends Toscan and Josephine Bennett) that the effort should be shifted in the direction of workers' education, the Finckes called a conference of left-wing labor activists to discuss such a project.

Among those who gathered at Katonah were John Brophy, president of District 2 of the United Mine Workers of America; Jay Brown, president of the International Timber Workers Union; Fannia Cohn, education director of the International Ladies' Garment Workers' Union; John Fitzpatrick, president of the Illinois Federation of Labor; Charles Kutz, head of Pennsylvania Railroad employees in the International Association of Machinists; Abraham Lefkowitz, vice president of the American Federation of Teachers; James Maurer, president of the Pennsylvania Federation of Labor; A.J. (Abraham Johannas) Muste, president of the Amalgamated Textile Workers of America; Joseph Schlossberg, secretary-treasurer of the Amalgamated Clothing Workers of America; and Rose Schneiderman, president of the Women's Trade Union League. They agreed on four basic points that would be the basis for the establishment of Brookwood Labor College:

1. A new social order was needed and was coming—in fact, it was already on the way.
2. Education would not only hasten its coming, but

would also reduce to a minimum and perhaps entirely eliminate the need to resort to violent methods.
3. The workers themselves would usher in the new social order.
4. There was an immediate need for a workers' college with a broad curriculum, located amid healthy country surroundings, where the students could completely apply themselves to the task at hand.

A Socialist perspective lay at the core of Brookwood's philosophy, but it was intimately intertwined with a commitment to practical trade union organizing within the framework of the American Federation of Labor (AFL). "Socialist ideas were not offered as a substitute for trade unionism, but rather as a supplement, a means of strengthening the union," as John Brophy explained. He and the others formed a board of directors for the Brookwood Labor College, and they selected A.J. Muste to be the day-to-day director of the college. A tall, lean thirty-six-year-old who had been an effective leader of the 1919 Lawrence Textile Strike, Muste had before that event been a scholarly pastor, associated with the pacifist Fellowship of Reconciliation, animated by the Social Gospel and by an enthusiasm for the socialism of Eugene V. Debs.

Although day-to-day activities at Brookwood would be determined by the faculty in consultation with the students, policy was set by the ten-person board of directors. The board would be made up of labor representatives, with a nonvoting Educational Advisory Committee, and with representatives of the faculty having four votes and of the students having two votes.

Fifteen students enrolled in 1921, and eventually the yearly number of students would average fifty. This was the beginning of a venture that would eventually educate close to 500 organizers and activists who would later help transform the American political scene.

A.J. Muste's Faculty and Students

With a few significant exceptions, the workers enrolled at Brookwood Labor College were young labor radicals, who were either open to or already influenced by various currents of left-wing thought. One early Brookwood student, Len De Caux, later described Brookwood's director in this way:

> A.J. Muste was the man who ran Brookwood, resident labor college, of the Twenties. We could not then have imagined his later career as militant activist in radical and pacifist causes—in his eighties he matched the youth as man of action against the Vietnam war. To us young Brookwooders, A.J. was essentially the moderate. We respected his counsels of caution, practicality, a relative labor conformism. But our favorite crack was that he always looked for the center with his "On the one hand . . . But on the other hand. . . ." I would have expected him to progress ever rightward, a typical social-democrat. Youthful impatients, we didn't suspect that fires like our own might burn beneath the diplomatic calm of this lean and eager man.

Revolutionary and pacifist A.J. Muste directed Brookwood Labor College, a school devoted to working-class organization and militancy in the 1920s and 1930s. *(Karen Eberhardt/Walter P. Reuther Library, Wayne State University)*

Muste's own evaluation of the faculty, staff, and students at Brookwood is also revealing. "Above all, the men and women . . . with whom I worked closely for a decade or more at Brookwood, in the general

A.J. MUSTE (1885–1967)

Abraham Johannes Muste was born on January 8, 1885, in Zierikzee, the Netherlands. A pacifist who became a Marx-Leninist revolutionary and then a pacifist again, Muste served as a minister in three different Christian denominations. Known to the public as A.J. Muste, he was sometimes called "America's Gandhi" because he was a leading influence on twentieth-century social movements in the United States.

Muste came to the United States at age six and was raised by a Republican family in the strict Calvinist traditions of the Dutch Reformed Church. In 1909, he was ordained a minister in that church and married Anna Huizenga, with whom he raised three children. He was class valedictorian at Hope College and received a degree from Union Theological Seminary, graduating magna cum laude.

In 1914, increasingly uncomfortable with the Reformed Church, he became pastor of a Congregational Church. When war broke out in Europe, Muste, inspired by the Society of Friends (Quakers), became a pacifist. Three years later his antiwar stance cost him his church, whereupon he took a church post with the Quakers in Providence in 1918. He then started working with the fledging American Civil Liberties Union in Boston. In 1919, as executive secretary of the Amalgamated Textile Workers (1919–1921), when the textile industry strikers appealed for help from the religious community, he suddenly found himself thrust into the center of the great labor strikes in Lawrence, Massachusetts. From 1921 to 1933, Muste served as director of the Brookwood Labor College in Katonah, New York. Its curriculum, which consisted of the theory and practice of labor militancy, supported his efforts to train labor activists.

For several years during the 1920s, Muste served as chairman of the Fellowship of Reconciliation but steadily drifted toward revolutionary politics, and in 1929 he helped form the Conference for Progressive Labor Action (CPLA), seeking to reform the American Federation of Labor from within. When the Great Depression hit, the CPLA became openly revolutionary and was instrumental in forming the American Workers Party in 1933, in which Muste played the leading role. He abandoned his Christian pacifism and became an avowed Marxist-Leninist. He was a key figure in organizing the sit-down strikes of the 1930s and merged his own political group with another to form the Trotskyist Workers Party of America.

In 1936, Muste traveled to Norway to meet with Leon Trotsky. It is not clear what took place, but Muste returned that same year as a Christian pacifist. Although he did remain active in the labor movement, in 1940 he became executive secretary of the religious pacifist organization Fellowship of Reconciliation (FOR), a post he held until 1953. The organization adopted radical methods of civil disobedience under Muste's leadership and inspired the organization of the Congress on Racial Equality, the first of the militant civil rights groups.

At age sixty-eight, Muste "retired" and wrote several books. In retirement he became the leader of the Committee for Nonviolent Action, an organization that actively protested nuclear power and arms proliferation. Muste was close to the emerging liberation movements in Africa, and he helped organize the World Peace Brigade, which worked closely with Kenneth Kaunda of Zambia and Julius Nyerere of Tanzania. In the United States, Muste served as close friend and mentor to Martin Luther King Jr. and his wife, Coretta Scott King.

Muste also became a pivotal figure in organizing opposition to end the Vietnam War. In 1966, he led a group of pacifists to Saigon, where, after trying to demonstrate for peace, they were arrested and deported. Later that same year, he flew with a small team of religious leaders to Hanoi where they met with Ho Chi Minh. Less than a month later, on February 11, 1967, Muste died suddenly in New York City. At his death, messages of condolence came from sources as diverse as Ho Chi Minh and Robert Kennedy. A brilliant thinker, he produced no single body of theoretical work but did leave behind a remarkable legacy of fighting for peace and social justice.

James G. Lewis

field of workers' education, and in various phases of labor organization and strike activity, were people of integrity," Muste later recalled. "They had their shortcomings, in a few cases distressing or irritating ones, but they were solid and clean, incapable of playing cheap politics, though by no means political babes or bunglers."

Muste himself taught courses in the history of Western civilization and the United States. Specializing in U.S. and international labor history was David J. Saposs, who had been a student and associate of John R. Commons and had co-authored with Commons, Selig Perlman, and others the classic *History of Labor in the United States.* His minor classic *Left-Wing*

Unionism: A Study of Radical Policies and Tactics (1926) (whose arguments against radical "dual unionism" coincided with those of William Z. Foster) was published by the Communist Party's International Publishers in 1926—though Saposs was not a member of the Communist Party (Brookwood students remembered him as being more moderate than Muste) and was destined to become a member of the National Labor Relations Board. Mark Starr—who taught economics and labor journalism—had been involved in the National Council of Labor Colleges of England; he would later become education director of the International Ladies' Garment Workers' Union and coauthor a standard popular text, *Labor in America* (1944), for use in high schools and labor education classes in the late 1940s and 1950s. He met his future wife, Helen Norton (a rail worker's daughter and college graduate from Kansas), on the Brookwood faculty, where she trained students in labor journalism and helped them produce the *Brookwood Review.*

One of the most popular and most radical of the teachers was Arthur W. Calhoun. Calhoun had an undergraduate degree from the University of Pittsburgh and a Ph.D. from the University of Wisconsin, and teaching experience at Clark University; he was also the author of a pioneering three-volume *Social History of the American Family from Colonial Times to the Present* (1917–1919) and taught sociology, economics, and even courses in Marxism, while his wife Mildred taught courses in English. (Calhoun was replaced in 1929 by an instructor from the Seattle Labor College, John C. Kennedy.) Another popular Brookwood stalwart was Josephine Colby, a high school teacher with a degree from the University of California; she was an instructor in English (also teaching English as a second language to many of the immigrant workers who came to Brookwood), literature, and public speaking, and directed many of the plays put on by the Brookwood Labor Players. Tom Tippett, who developed as an energetic labor educator during his years as a radical mine workers' organizer, served as director of Brookwood's extension program, organizing classes for central labor councils, state labor federations, and local unions. According to one student, he was "a stimulating and colorful teacher who correlates theory with practical activity"; he also became involved in union-organizing efforts in the South, which he described in the classic *When Southern Labor Stirs* (1931).

Workers from mostly urban and largely industrial environments were not brought into a well-organized and beautiful campus in a rural setting for the purpose of duplicating normal "higher education," which Brookwood supporter Jean Flexner described as catering to "the inexperienced, impressionable dilettante, who drifts with open and colorless mind through a kaleidoscope of courses to emerge without deep convictions or definite objectives." Seasoned labor radical Clint Golden—Brookwood's field secretary, who raised money, secured union support, and scouted for students—explained that workers needed "expert knowledge as a weapon in their struggle for justice," emphasizing: "By developing and controlling our own institutions of learning, for the men and women of our movement, we will educate the workers into the service of their fellow workers rather than away from the labor movement, as is so often the case when the ambitious unionist enters the average university." And yet, according to Cara Cook (the librarian who also oversaw much of the administrative work and tutored as well), a distinctive characteristic of Brookwood was that "we were always singing." One of the songs gave a humorous sense of faculty and staff:

> There's A.J. Muste, a teacher, He used to be a preacher . . .
> And Polly Colby makes them speak, With phrases smooth and manner neat . . .
> Dave Saposs tells them stories, About past union glories . . .
> And Helen Norton makes them write, For labor papers day and night . . .
> Tom Tippett teaches classes, In the field to union masses . . .
> While J.C. Kennedy does his stuff, and Makes them learn their Marx enough . . .
> Mark Starr does British labor, With considerable British flavor . . .
> And Cara Cook does this and that, and runs the Secretariat . . .

Singing, socializing, putting on plays, playing baseball, communing with nature—all were essential elements of the Brookwood experience. So was physical labor, with all students and faculty expected to help with the work that was necessary to prepare meals, wash dishes, do the laundry, clean the various facilities of the institution, maintain the grounds, repair and expand the school's buildings, and so on. "The importance and dignity of hand work and head work are both fully appreciated," Brookwood's founding committee affirmed.

Another aspect of the Brookwood curriculum was

fieldwork. This involved practical experience assisting unions (sometimes in strike situations or assisting in the efforts of union reformers) or engaging in other campaigns—such as participating in the struggles to save the lives of the famous Italian Anarchists sitting on Death Row, Nicola Sacco and Bartolomeo Vanzetti, or participating in antiwar activities. Faculty as well as students were expected to do such fieldwork.

Students could attend Brookwood for either one or two years. The first year offered more basic courses, and the second (for those returning) offered more advanced training. In addition to courses designed to give a background in history, sociology, economics, and other academic areas, there were courses designed to teach practical skills for labor activists: Trade Union Organization, Structure, Government and Administration of Trade Unions, Labor Journalism, Labor Legislation and Administration, The Strategy of the Labor Movement, Public Speaking, Labor Dramatics, and Training in Speaking and Writing. A typical first-year student might, for one term, study economics two mornings a week, English three mornings a week, and in the afternoons have drama twice a week and sociology three times a week. A typical second-year student might have morning courses in public speaking and drama twice a week, journalism twice a week, and labor issues twice a week; with the afternoons involving intensive labor history and social psychology courses.

The evenings might involve social or cultural activities—or educational discussions with guest speakers: novelist Sinclair Lewis, labor historian Norman Ware, A. Philip Randolph of the Brotherhood of Sleeping Car Porters, Norman Thomas of the Socialist Party, Father John A. Ryan of the Catholic Social Welfare Council, Communist Party educator Bertram Wolfe, philosopher John Dewey, economist Scott Nearing, Fenner Brockway from the British Labor Party, J. Olson of the Norwegian Labor Party, Socialist educator and journalist Oscar Ameringer, Roger Baldwin of the American Civil Liberties Union, John Keracher of the Proletarian Party, historian Harry Elmer Barnes, and many others.

Diversity was a hallmark of Brookwood's student body, which ranged in age from teens to people in their fifties (though a majority were between twenty-one and thirty years old). About one-third of the student body was female (much higher than the percentage of women in the labor movement of that time). A survey of forty-two students in 1927 reveals that about 52 percent were native-born and 48 percent foreign-born, with the great majority (thirty-three students) coming from families of industrial workers, and half had completed no more than eight years of school (some significantly less). Although the largest number of students came from the industrial Northeast, many came from the South and Midwest, and some from the far West as well as from other countries. There was also significant ethnic diversity, including African-American workers and activists. Ideological diversity was also represented in different religious backgrounds and different political orientations. A mixture of Socialists from various organizations (and from no organization at all) mixed with Anarchists and "pure and simple" trade unionists, as well as workers who didn't identify themselves with such labels.

Gompers and Lenin

Debate and discussion were encouraged at Brookwood, and all were urged to see themselves as part of the effort to revitalize the labor movement. Dominant currents within the AFL increasingly saw this approach as a threat; as the 1920s unfolded, they were increasingly inclined to become even more conservative than the ex-Socialist, "pure and simple" AFL president Samuel Gompers had been. They certainly did not want to be "revitalized." Ultimately, this tension deepened and finally tore Brookwood apart.

Along with Gompers and many others in the labor and Socialist movements, most of Brookwood's faculty, staff, and students threw themselves into the 1924 third-party presidential campaign of Progressive Robert M. La Follette. La Follette netted an impressive 4 million votes, but the AFL leadership reared back from what it considered a terrible failure. In contrast, Brookwood spokesmen continued to advocate the creation of an independent labor party. They also were increasingly inclined to criticize the exclusive craft-union focus on skilled workers favored by the dominant forces in the AFL, calling for new industrial unions that would organize unskilled mass production workers. Moreover, they were tolerant or even actively sympathetic toward various forms of labor radicalism that challenged the AFL's top leadership.

The list of guest speakers, as we have seen, included a large percentage of left-wing figures, some of whom were members of or close to the Communist Party, which was anathema to the AFL leadership. For that matter, several of the faculty members—Calhoun, Saposs, Colby, and Tippett—were identified (falsely) by some AFL conservatives as being Communist Party members.

The school staged memorials to commemorate the

deaths not only of AFL founder Samuel Gompers, but also of Russian Communist leader Vladimir Ilich Lenin and U.S. Socialist leader Eugene V. Debs. May Day celebrations featured portraits of all three, along with such others as Rosa Luxemburg and Leon Trotsky. (Muste later commented: "The composition of the student body being what it was, some of them were as irked at having Gompers' picture on the wall as others were by Lenin's, but it was in accord with the catholicity we observed in these matters that both were there and the entire student body took part in the meeting.") Then too, some songs sung at Brookwood may have proved offensive to labor conservatives. One of these songs was written by student Edith Berkowitz and contained, in part, the following words: "They've refused to heed our suffering, But they'll hear our marching feet! We have the workers' Red Flag unfurled. We come to take back our world."

After several years of fruitless efforts to force Brookwood to submit to their more conservative labor orientation, in 1928 the AFL leadership—relying on informants placed within the student body—released a sensational public denunciation of Brookwood Labor College as Communistic and called on its affiliates to sever relations. Many of them refused to do so when Brookwood denied the charges, and many prestigious pro-labor liberals and radicals rallied to the college's defense. And yet the situation created terrible tensions—which were complicated by the Communist Party's attacks on Brookwood in the same year.

Among the Communists attending the college at that time were Sylvia Bleeker and her companion Morris Lewit, who—in the factional disputes within the Communist Party at that time—were aligned with William Z. Foster against the organization's general secretary Jay Lovestone. Factional infighter that he was, Lovestone made a point of having the Party press attack Brookwood in 1928 as "class-collaborationist," serving as "a cloak for the reactionary labor fakirs." He publicly berated the "Fosterites" at the college for co-signing the Brookwood statement allegedly "denouncing the communist movement and kowtowing to the American Federation of Labor bureaucracy." This began an irreversible development of Communist Party hostility to Brookwood that continued well after Lovestone lost his factional fight. (Under the influence of Soviet dictator Josef Stalin, U.S. Communists from 1929 through 1934 would attack all Socialist groups and labor organizations not controlled by the Communist Party.)

Adding to the tangle was the fact that Brookwood faculty member Arthur Calhoun publicly disassociated himself from the college's defensive statement. While insisting that he was not a member of the Communist Party, he argued that the college should openly break from reactionary AFL leadership and politically align itself with the revolutionary orientation that the Communists represented. In response, Muste and the majority of the faculty (including those who had been red-baited by the AFL leaders) urged the board of directors not to renew Calhoun's contract. This created new dissensions among Brookwood's remaining supporters.

And then the Great Depression came. This, combined with the attacks from the AFL, caused Muste and some of the others associated with Brookwood to assume a more radical trajectory. Since 1924, the Socialist magazine *Labor Age*—edited by labor activist Louis F. Budenz—had become increasingly associated with Brookwood, and by 1929 Muste was working with Budenz and others in the milieu of the magazine and college to establish the Conference for Progressive Labor Action (CPLA). A number of Brookwood graduates and supporters became involved in the new venture—which began with a call for (1) organizing the unorganized workers into unions, (2) working to transform the craft unions of the AFL into more inclusive industrial unions, (3) breaking down all exclusion from union membership for racial, political, economic, social, or religious reasons, (4) launching government programs providing unemployment benefits and other forms of social insurance, (5) creating a labor party based on the trade unions, (6) persuading the U.S. government to recognize the Soviet Union; and (7) encouraging anti-imperialist and antimilitarist policies by the U.S. labor movement, which would lead to "a closer union of all workers of the world."

With the coming of the Depression, however, a majority of activists in the CPLA became more intensely involved than ever in the struggles of the unemployed (building militant Unemployed Leagues), as well as in desperate strike actions. Through the early 1930s, a powerful dynamic of radicalization drew Muste and a number of CPLA members to the conclusion that—in competition with what they saw as the "sectarian" Communist Party and the hopelessly compromising Socialist Party—the CPLA should evolve into a revolutionary vanguard party that operated according to the principles of democratic centralism. This would mean that its members would be "workers and fighters in the revolutionary movement"—with "the policies which they carry out

in a disciplined manner . . . worked out by these members themselves on the basis of the most democratic discussion." Muste urged that "Brookwood be transformed into a training base" for "CPLA fighters" and that it focus less on general education and more on "action and direct involvement in the labor struggle."

A majority of Brookwood's faculty (including Colby, Norton, Saposs, and Starr) and the board of directors decisively rejected this version of the CPLA in 1933. The break was painful. Muste and his supporters left the college to pursue their radical course. Brookwood continued for almost four more years under the capable and energetic leadership of Tucker P. Smith, who was recruited not from the labor movement but from the pacifist Fellowship of Reconciliation. Among the new faculty was Roy Reuther, who with his brothers Walter and Victor (both of whom also visited Brookwood) would play a key part in the creation of the United Auto Workers. Those remaining sought to adhere to Brookwood's original goals, yet the college's spirit was altered and its base significantly eroded by what had taken place. Lack of funds forced it to close its doors in 1937.

Legacies

Brookwood Labor College was a vital moment in the history of the American labor movement; though itself unable to endure, it left an enduring legacy. Its faculty formed Workers Education Local 189 of the American Federation of Teachers, which expanded beyond Brookwood during the 1930s to embrace labor educators in many locations. Internal differences led to a shift in affiliation to the Communication Workers of America, but Local 189 has continued into the twenty-first century as a gathering place for labor educators and as the symbolic high point in workers' education.

Many Brookwood veterans played an essential role in the battles, strikes, and organizing efforts that created the Congress of Industrial Organizations. Although the Socialist future that had animated them never came into being, many of them went on to assume important posts in the CIO (and after 1955 in the AFL-CIO) and its various union affiliates, as well as in the fields of education, politics, and government. While many of these former radicals became very much a part of the trade union "establishment," younger labor radicals seeking to revitalize the labor movement have often looked to the Brookwood experience for inspiration and useful lessons.

Muste and those who followed him away from Brookwood with the CPLA went on, during the early years of the Depression, to militant actions of the Unemployed Leagues and "class struggle" activities. One of the most dramatic of these activities was the Toledo Auto-Lite Strike of 1934. The CPLA evolved into the American Workers Party at the end of 1933, and then it merged with the Communist League of America (followers of Leon Trotsky) at the beginning of 1935. Some of Muste's comrades stayed with the Trotskyists for many years, others ended up in other groups, and some dropped out of left-wing politics altogether. Muste himself soon returned to his radical pacifist and Christian roots in the Fellowship of Reconciliation, where he played a leadership role in antiwar and antiracist struggles for many years afterward.

The Brookwood experience impacted on other radicals who had a major impact on the civil rights movement of the 1950s and 1960s. Myles Horton visited and studied Brookwood as a partial model for the Highlander Folk School, which he and other radical educators established in Tennessee during the 1930s and which shifted from training labor activists to training civil rights activists in the 1950s. One Highlander associate who was centrally involved in establishing both the Southern Christian Leadership Conference (SCLC) of Martin Luther King Jr. and the Student Non-Violent Coordinating Committee (SNCC) was Ella Baker—who was also a graduate of Brookwood Labor College.

Labor Movement 1935–1947

The birth of the Congress of Industrial Organizations (CIO) represented a watershed in American labor history. At the center of labor activism during two crucial decades, the CIO not only exercised a key role in the establishment and expansion of collective bargaining in the nation's core industries, but it also provided a political voice for the nation's working class. During the era of the New Deal and World War II, the CIO pioneered and supported political initiatives that involved economic policy and social welfare. In the process, the CIO aided in the forging of the New Deal Democratic coalition, which dominated American politics for nearly forty years.

Besides involving itself in domestic affairs, the CIO and its ideologically diverse leadership engaged in debate surrounding the politics of anti-Communism both at home and abroad, especially in the early years of the Cold War. Overall, CIO leaders acted as critical supporters of the government's anti-Communist foreign policies, while at the same time, they molded their practices of modern political action initiatives in the domestic political arena, especially in the area of civil rights, of which they were pioneers. Extensive debate surrounding the political dimension of the industrial union crusade and the competing visions on how to advance organized labor characterized the CIO in the years following World War II. The diverging political currents among CIO leaders, which included but were not limited to communism, the role of government in regulating organized labor, and a cautious approach in the organizing of African Americans in the South, were greatly responsible for its failure to organize workers in Operation Dixie. All of those issues, and especially growing government intrusion into the internal affairs of the CIO as reflected in the 1947 Taft-Hartley Act, weighed heavily in its decision to merge with the American Federation of Labor (AFL) in 1955.

The Formative Years

Begun in November 1935, as an attempt to encourage the growth of industrial unionism within the American Federation of Labor (AFL), John L. Lewis, of the United Mine Workers of America (UMW) and other unions, created the Committee for Industrial Organization. Benefiting from the financial resources provided by the UMW, the CIO had a high degree of activism that contrasted sharply with the AFL's craft unions' organizational inertia. Specifically, the AFL had failed to seize opportunities for industrial unionism afforded by national legislation aimed at economic recovery during the early years of the Great Depression and the New Deal.

Signed into law on June 16, 1933, the National Industrial Recovery Act (NIRA) created the National Recovery Administration (NRA), which was responsible for restructuring the entire nonagricultural economy. For workers, the relevance of the legislation involved the creation of codes in each industry that regulated work hours and established minimum wages. Of particular importance to organized labor were Sections 7a and 7b, which proclaimed the right of workers to establish unions of their own choosing, free from employer domination.

For the remainder of 1933 and through 1935, industrial workers responded enthusiastically to this legislation, which was reflected in a remarkable surge in union membership and activism. Between 1933 and 1935, AFL membership grew by 30 percent as the UMW and garment workers' unions rebuilt their organizations, which had fallen victim to the successful anti-union employer offensive that had dominated the 1920s. These AFL industrial union outposts were joined by workers forming new unions in mass production industries, such as the steel and auto, rubber, textiles and electrical goods, all of which sought AFL affiliation. By 1935, AFL membership had reached 3

DAVID DUBINSKY (1892–1982)

The president from 1932 to 1966 of the International Ladies' Garment Workers' Union (ILGWU), Dubinsky was born in Brest-Litovsk, Poland, on February 22, 1892. He was a baker in his father's shop in Lodz (then in Russian Poland) and joined the baker's union at age fourteen. The General Jewish Workers' Union, or *Bund*, was a highly political organization of Jews from Poland and other parts of the Russian empire. The union looked to socialism as the best solution for preserving and promoting Jewish culture and bringing relief to the workers of the world, a belief that Dubinsky carried with him the rest of his life. A year after joining, he became the secretary for the local union. He was arrested a year later and banished in 1908 to a Siberian prison. He escaped and reached the United States in 1911, where he became a cloak cutter and joined the ILGWU.

At the time he joined, and for the remainder of his time in the union, Dubinsky led the fight within the union against the Communists and helped make unions a bulwark of democracy. Before and during World War II, the fight spread to the American Labor Party, a Socialist political party in New York State that Dubinsky helped to found in 1936. Like the Garment Workers' Union, it was also largely comprised of East European Jewish refugees who were divided into pro- and anti-Communist factions. When the Communists seized control of the party, Dubinsky and his fellow Socialists left the party in 1944 to form the Liberty Party, which soon overtook his old party in membership numbers.

Dubinsky rose rapidly through the ranks of the Garment Workers' Union and became president in 1932, serving for thirty-four years. Under his guidance, he transformed the union from a struggling financial entity on the verge of collapse to one with assets in the hundreds of millions of dollars. The union took on issues such as the provision of health insurance, severance pay, retirement benefits, and a thirty-five-hour work week. He also worked to abolish the sweatshops that were ubiquitous in the industry. He led the expansion of membership of the ILGWU during the Great Depression, when union membership jumped in numbers because of federal support for them.

Although a vice president of the American Federation of Labor (AFL), Dubinsky led (1935–1936) his union in joining with the Committee (later Congress) of Industrial Organizations (CIO), which organized unions by industry. When the AFL, which organized unions by trade, suspended the CIO unions in 1936, Dubinsky resigned from the AFL. However, he opposed the establishment of the CIO on a permanent independent basis, and in 1938 he also broke with it, thus making the ILGWU independent.

In 1940, the ILGWU reaffiliated with the AFL. Dubinsky then launched a campaign to rid the AFL of mob ties, but struggled against a reluctant and frightened leadership. In 1945, he again became a vice president and member of the executive council of the AFL. After a change of leadership in both organizations in 1952, he saw his opportunity and worked for a merger of the two, which took place 1955. He again pressed for cutting mob ties. His lengthy efforts to oust corrupt union leaders who had mob connections culminated in the anti-racket codes adopted by the AFL-CIO in 1957. He retired from the presidency in 1966 and served as director of the union's Retirees Service Department. He was awarded the Presidential Medal of Freedom in 1969, the nation's highest civilian honor. He died on September 17, 1982.

James G. Lewis

million. Although Lewis and the UMW provided seasoned organizers and financed much of the new activity, he and his UMW staff received help from a variety of veteran and emerging trade union leaders who understood that tapping into the mass activism was not enough. A revitalized and assertive American labor movement required disciplined leadership.

Leaders like Sidney Hillman, head of the Amalgamated Clothing Workers of America (ACWA), and David Dubinsky of the International Ladies' Garment Workers' Union (ILGWU) were nominal Socialists and were critical of the AFL and its leaders. Yet they were also ardent supporters of the New Deal and President Franklin D. Roosevelt. At the same time, they adhered to the AFL principles and tradition of placing collective bargaining at the top of the union agenda and the notion that effective unionism necessitated centralized and authoritative leadership guided by an unflagging belief in the American free-enterprise system.

Lewis's most reliable allies, however, and those most responsible for overseeing the union organizing drives in mass production industries during the latter part of 1930s, were two UMW stalwarts and former adversaries, John Brophy and Adolph Germer. Brophy, defeated by Lewis for the presidency of the UMW in 1926, was a capable organizer with ties to

radical political groups. As a veteran activist known for his independence and integrity, he filled the position as director of the CIO's daily operations. Immediately, Brophy appointed Germer, another former UMW activist, as the organization's first field representative. Circulating throughout the heartland in 1935 and 1936 in an attempt to align the CIO with the increasing militancy of workers in that region, Germer emerged as a full-time adviser to rubber workers, who during those years tenaciously struggled to establish industrial unionism in Akron, Ohio.

Strikes, Politics, and Organizational Independence

The rubber workers of Akron not only battled the likes of the Goodyear, Goodrich, General, and Firestone Tire companies, but they also had fought among themselves, because those enterprises had established company unions that had obtained a significant degree of credibility over the years. In July 1935, however, Congress enacted the National Labor Relations Act (NLRA) after the Supreme Court had ruled the NIRA unconstitutional. A key provision of the NLRA was prohibition of overt company support for labor organizations. This element of the law, along with other sections that declared a number of management practices toward worker organization illegal, provided space for rubber workers to organize.

The AFL had denied the United Rubber Workers' Union a full charter under the auspices of the NRA and instead advocated reliance on the federal government and cooperation with employers to bring collective bargaining. This strategy had failed to produce improvements in wages and working conditions, or to address the problem of employer disciplining of union activists. After Goodyear fired 137 tire builders in February 1936, workers walked out and eventually formed an eleven-mile picket line around the huge factory complex. A month later the strikers emerged victorious. But even after strikers earned recognition from the company, Germer complained to Brophy that the URW was dominated too much by irresponsible militancy.

The thrust of CIO organizing then moved to the steel industry where slightly more than a half million workers encountered employment instability, arbitrary and capricious promotion and discipline policies, along with confusing pay schedules and job assignments. The NRA had provided the impulse for thousands of steelworkers to join the AFL-affiliated Amalgamated Association (AA) with the hope that it would remedy their problems. In addition, the AFL had been advocating an expanded organizing drive among the workers in America's quintessential heavy industry. Like their rubber industry counterparts, the steel magnates had established company unions to blunt workers' efforts to form independent organizations and representation. As in the case of the rubber workers, AFL inertia had left eager-for-organization steelworkers disillusioned. On June 12, 1936, Lewis announced the formation of the Steelworkers Organizing Committee (SWOC). Lewis staffed the SWOC board with UMW hands, Philip Murray and David J. McDonald, while infusing the organizing drive among steelworkers with $500,000 from the miners' union treasury. SWOC published a newspaper, established a research department, and hired full-time legal counsel. But the organizing drive lacked the enthusiasm characteristic of the rubber workers' struggle, and the campaign developed slowly as a result.

This lack of vitality combined with the fact that the upcoming 1936 presidential election detracted CIO attention away from organizing. A consensus had developed among the CIO hierarchy that Franklin Roosevelt's reelection was crucial to the success not only of its current organizing initiatives, but also to the very survival of the CIO itself. In May 1936, the CIO established an ad-hoc committee to support Roosevelt and other progressive candidates. Throughout the fall campaign Lewis frequently visited industrial America, met with Roosevelt personally on a number of occasions, and addressed the nation on the radio calling for support of the president. For his part, Murray shifted resources and organizers from SWOC to the political campaign. Roosevelt's November landslide ensured that the NLRA would not be repealed. It also cleared the way for more organizing as union leaders and workers were confident that the president, after overwhelmingly receiving the labor vote, would surely support the expansion of collective bargaining.

Following the election, the CIO succeeded in bringing industrial unionism to most key sectors of the economy. Besides finally making breakthroughs in the steel and automotive industries, CIO collective bargaining entered the workplace in transportation, the appliance industry, meatpacking, and on the docks in the nation's ports. Some of those victories, however, proved ephemeral. Although the SWOC signed an agreement with U.S. Steel, companies employing over 150,000 workers known as Little Steel fiercely resisted, and the struggle culminated in the police murder of ten Chicago strikers on Memorial

Day, 1937. The rubber barons in Akron still resisted the URW and CIO, and organizing drives among textile workers in the South had stalled. Although Henry Ford's company carried out a reign of terror inside his huge Detroit and Dearborn plants, the United Automobile Workers (UAW) signed agreements with Chrysler and General Motors (GM). The bargaining agreements materialized as a result of the 1937 sit-down strike in Flint, Michigan.

Representing the apex of mass production industry with its featured assembly line, the auto companies had become masters of high-performance workplace innovations. Constant restructuring and redefining skills combined with the latest in union-busting tactics to forestall unionization in the industry for more than two decades. But as the Depression dragged on, autoworkers grew more vocal and employed bold tactics in their protest against worsening conditions. First, the NRA, and later the NLRA, helped to galvanize union sentiment as autoworkers marched and went on strike. In late 1936, autoworkers everywhere were demanding union recognition by using a new tactic, the sit-down strike.

On December 30, 1936, workers sat down in two GM Fisher Body plants in Flint. Shutting down the machines, the Flint autoworkers ejected foremen and company guards and stopped GM production of all Chevrolet, Buick, and Pontiac models. With broad

Spectators outside the Fisher Body Plant on January 17, 1937, watch as sit-down strikers refuse to evacuate the auto plant. The sit-down strikers played a crucial role in the organization of the United Auto Workers union. *(Brown Brothers)*

support from the community, the strikers and their wives fought off police attempts to storm the plants and crush the rebellion. Meanwhile, acting as the CIO's chief spokesperson, John L. Lewis skillfully negotiated through elected public officials in the state of Michigan and at the level of the federal government to bring GM to the bargaining table. The result was a February 11, 1937, agreement that ended the six-week struggle and obliged GM to recognize the UAW as the exclusive bargaining representative. The Flint sit-down strike was a monumental leap forward in the establishment of industrial unionism in the automotive industry, and, at the same time, it lent credibility to the CIO course of militancy, which sharply contrasted with the more cautious approach of the AFL.

Success in the organization of auto industry workers not only swelled CIO membership, but also enhanced organized labor's political influence and clout. In 1938, over the objections of many pro-business politicians in the North and Southern conservatives, Congress passed the Fair Labor Standards Act, which established the minimum wage as well as the regulation of hours and the requirement of overtime pay. The legislation, along with the Social Security Act passed in 1935, was viewed by many as proof that the CIO had emerged as a key player in helping the advance of New Deal reform initiatives. This factor, combined with successful organizing campaigns in a variety of industrial sectors, resulted in the CIO's formal break with the AFL in 1938, when it adopted

its permanent name, the Congress of Industrial Organizations.

The CIO, Labor, and World War II

Almost immediately following the break with the AFL, serious infighting developed among the organization's central figures. From the CIO's beginning, differences existed, but they largely had been submerged and subordinated to the idea of building up the ranks of organization. But as the economy continued to worsen in 1939 and CIO membership remained stagnant, troubles mounted. Serious disagreements that emerged over the CIO's relationship to the federal government as the nation drifted toward war divided the leadership. These problems mounted on top of the ILGWU departure in 1938 and an intense factionalism within the UAW that almost resulted in an organizational implosion. In 1940, Lewis and Sidney Hillman engaged in open conflict over Roosevelt's seeking an unprecedented third term as well as his foreign policy, which Lewis claimed was moving the nation toward war. As a result, Lewis departed from the CIO and turned the reins of leadership over to steelworkers' head Philip Murray.

Lewis's leaving the CIO paralleled the outbreak of World War II, which began on September 1, 1939. The war in Europe also was responsible for sharpening the conflict and the growing rift between Lewis and Hillman. Although Lewis was now outside the CIO, he was still recognized as America's principal labor leader, and his publicly expressed views on war mobilization and organized labor's relationship with the federal government reached a broad audience. Although Hillman closely identified with the administration's foreign policy, Lewis was an ardent isolationist. Hillman, especially after May 1940, when Germany invaded France, sought to tie organized labor to government plans for war preparation, which involved implementation of a program for dramatically increasing industrial production. Consistent with his philosophy that government-labor cooperation was optimal for advancing the CIO, Hillman accepted Roosevelt's offer to be appointed as labor's representative to coordinate the rising military production. Lewis, meanwhile, constantly expressed antiwar views and criticized Hillman for allowing the government to award contracts to industrial firms that violated federal labor laws with impunity.

In 1940, Lewis supported Roosevelt's opponent, utilities executive, Wendell Willkie. After Pearl Harbor, more of the U.S. economy became enmeshed in war production, and the Roosevelt administration received a no-strike pledge from CIO leaders. The agreement was possible because in January 1942, Roosevelt abolished the National Defense Mediation Board (NDMB) and replaced it with the National War Labor Board (NWLB). Created in March 1941, the NDMB was a tripartite body charged with trying to settle union disputes with companies holding defense contracts by issuing nonbinding recommendations. Although it had worked for Lewis and the UMW during a nationwide strike of mines owned by the steel firms, the CIO and the government desired a mechanism that would be more decisive and therefore better serve to stabilize industrial relations and production during wartime.

Unlike the NDMB, the NWLB had power to issue "directive orders" without Roosevelt's approval. NWLB jurisdiction extended to any labor-management dispute that might interrupt work and thereby contribute to the effective prosecution of the war. In effect, virtually the entire U.S. economy became subject to the NWLB. And with Roosevelt linking labor peace directly to national security, the NWLB and the courts, as highlighted in the *Little Steel* case, required workers to maintain union membership during the life of the union contract. Despite these legal advances for organized labor, Lewis, not willing to surrender the right to strike and rely exclusively on the judgment of the NWLB, severed UMW ties with the CIO in 1942. Although the ranks of the CIO grew by some 40 percent and membership approached 5 million, the AFL emerged from World War II larger than the CIO. Despite the CIO no-strike pledge, many rank-and-file acted independent of the leadership and ignored the policy, striking war-related industries frequently. Consequently, the AFL succeeded in portraying itself as more responsible and better able to stabilize production. Accordingly, many employers opted for recognizing AFL unions rather than run the risk of experiencing disruptive work actions by angry CIO rank-and-file members.

Strikes also fueled antilabor sentiment, which resulted in the Republicans gaining seats in both the House of Representatives and the Senate in 1942. In June 1943, Congress passed the Smith-Connally Act, which, among other things, authorized government seizure of war and military production operations threatened by labor disputes, and banned strikes in federally operated plants. Smith-Connally also limited union political activity. The CIO responded by creating a Political Action Committee (PAC), which resulted in bringing closer ties between the labor organization, Roosevelt, and the Democratic Party. Be-

JOHN L. LEWIS (1880–1969)

Born in Cleveland, Iowa, on February 12, 1880, Lewis was the son of a Welsh immigrant coal miner. Between 1898 and 1907, Lewis tried coal mining, farming, construction, and business before entering the labor movement. Working as a miner after 1906, he rose through the union ranks, and by 1909 he had become a national organizer for the American Federation of Labor (AFL) and then president of the United Mine Workers of America (UMW) in 1920, a post he held until 1960. Lewis fought vigorously to build up the declining union in a sick industry, won the loyalty of the miners, and thus consolidated his own power. He did so by courting management. He was welcomed by businesspeople and even served as chair of the Republican Party's National Labor Committee.

In the midst of the Great Depression in the 1930s, he joined the Democratic Party in 1932 hoping that the national government would help stabilize industrial relations in the coal industry. He worked closely with Franklin Delano Roosevelt after his election in 1932 and had welcomed the New Deal. Frustrated with the AFL's failure to organize mass production workers, he split with the AFL. Taking several of the largest unions with him, Lewis founded a new organization, the Committee (later Congress) of Industrial Organizations (CIO) in 1935, and became its first president. By 1937, the CIO had taken control of the nation's two largest mass production companies, General Motors and U.S. Steel, and Lewis was at the peak of his power. When Lewis felt President Roosevelt took labor for granted, he supported Republican candidate Wendell Willkie for the presidency in 1940 in hopes that a Republican candidate elected with labor votes might support the union in general and Lewis specifically. He staked his CIO presidency on Willkie's victory. When Roosevelt won, Lewis resigned from the CIO but remained head of the UMW.

Increasing antagonism between Lewis and Philip Murray, the new head of the CIO, led to a break, and in 1942 the UMW withdrew from the CIO. Lewis maintained power despite the separation. During World War II, Lewis faced a hostile War Labor Board and unfavorable public sentiment because of the many strikes of the coal miners in the "no-strike" period. Although they did win the demands of the miners, these strikes alienated public support and may have helped to pave the way for later anti-strike legislation. Between 1945 and 1950, he led four national coal strikes. The UMW again joined the AFL but split off a year later in 1947, once more in a dispute over means of combating the restrictive Taft-Hartley Act. Lewis's failure to obey a federal court order to end a protracted coal strike led to a heavy fine for criminal contempt of court in 1948.

After 1950, Lewis ended his more aggressive tactics and followed a policy of accommodation with the declining coal industry. He steadily improved the material conditions of union members, and won esteem as an apostle of "cooperative capitalism" because his cooperation stabilized the industry. Despite the improvements for his workers, they suffered in the long run when they became victims of technological change. He voluntarily resigned as president of the UMW in 1960 and served as chairman of the UMW's Welfare and Retirement Fund after his retirement. He died on June 11, 1969.

James G. Lewis

cause Smith-Connally declared direct union financial contributions in general elections illegal, PAC activity focused on nonpartisan voter registration and education campaigns. The political activity combined with the no-strike pledge played an instrumental role in gradually guiding the CIO to rely more on political and institutional structures rather than on mass mobilization and work actions as the principal means to better the lot of American workers.

The 1945–1946 Strikes: CIO Leadership and Strategy

As the war ended, however, a temporary shift away from this trend was necessitated by the fact that, during World War II, basic wage rates had eroded. Although stable employment, job upgrading. and ample opportunity to work overtime hours during the war years enabled workers to earn income, inflation continued to eat away at their standard of living. After the end of the war, orders for factory goods disappeared. Unemployment among the civilian workforce increased 25 percent. Although the CIO urged government to stimulate economic growth and provide security through housing and welfare programs, increases in wages remained at the core of the postwar CIO bargaining agenda. The CIO joined prominent economists in arguing that mass purchasing power was necessary to generate and sustain economic

growth and essential in avoiding a return to the conditions of the 1930s. The CIO and some economists asserted that American business could afford to give substantial wage increases without raising prices. But business chafed at union demands for wage increases. And the most strike-riddled episode of American history followed.

In the last few months of 1945, America lost over 28 million man-days to strikes. In November, 180,000 UAW members struck GM. By January 1946, 500,000 steelworkers, 200,000 electrical workers, and 150,000 CIO packinghouse workers had joined them on the picket lines. In February, the nation lost almost 20 million man-days to strikes. In the end, the strikes won substantial wage hikes for workers in those industries, increases that ranged between 15 and 20 percent. As a result, the CIO increased the number of workers it represented and were covered by contract to over 1.7 million. Although relatively successful, in the end, the strikes revealed sharp, divergent views among the CIO leadership over the future direction of the organization, especially in terms of how to build and define collective bargaining structures in a modern, industrial economy.

Whereas steelworkers' chief Philip Murray advanced the notion of business-labor cooperation with the government providing general oversight, Walter Reuther, the emerging leader of the UAW adopted a more confrontational approach. He emphasized capitalizing on worker militancy and mobilizing public opinion to hold American business accountable not only to labor, but to the average American citizen as well. Reuther argued that, when giant firms such as GM claim they cannot afford to give workers wage increases, they should be required to open their books to public scrutiny. The UAW leader claimed his position was consistent with the fact that the collective bargaining process itself was widely publicized, and that wages and other terms and conditions of employment for mass production workers were known to the general public.

But Reuther's strategy for organized labor backfired when President Harry Truman reacted to mounting political pressure. In December 1945, Truman called upon Congress to enact some form of antistrike legislation. At the core of Truman's request was a proposal for preventing strikes in industries affecting the public interest. It involved cooling-off periods during which presidential fact-finding boards would gather and examine evidence and issue nonbinding recommendations. Although Congress did not act on Truman's proposal, it planted the seed for future antistrike legislation, which would result in weakening organized labor overall.

Other factors emanating from the strike wave of 1945–1946 also forecasted hard times for the CIO and organized labor. Overall coordination of the strike movement by the CIO was nonexistent. In its place, for example, unions such as the United Electrical Workers (UE) and the UAW, which both represented 30,000 workers at GM's Frigidaire Division, competed against one another by pursuing strategies and making tactical decisions based exclusively on their own interest. Also not boding well for building a stronger CIO was the emerging issue of Communism. This factor, along with others, including a failure by the CIO leadership to reach consensus on linking membership to broader social purposes, such as civil rights, greatly impacted organizing in the immediate postwar years, especially as it related to Operation Dixie.

Operation Dixie

Although the CIO suffered from internal divisions, the results of 1945–1946 ushered in optimism surrounding the building of membership, especially in the South. World War II had produced significant gains for the CIO in the region, as its membership in Dixie reached 225,000. At war's end, CIO unions were administering 42,000 collective bargaining contracts with Southern-based textile firms. Oil workers had doubled their prewar membership in Louisiana and Texas, pulp and paper workers had unionized in Virginia, and the URW had established strong locals in Memphis and Gadsden, Alabama. Accordingly, in early 1946, CIO leadership permanently established the Southern Organizing Committee (SOC).

From its inception, important aspects of Operation Dixie were well planned and funded. SOC deployed teams of organizers, which formed functioning unions that were integrated into the various CIO affiliates. The USWA (United Steelworkers of America), UAW, and UE all provided hundreds and thousands of dollars for the campaign, and organizers collected a one-dollar initiation fee from new recruits. SOC leaders and organizers hoped to recruit military veterans, who were exempt from the initiation fee, and native Southerners. The strategy reflected the desire by CIO leaders not to have the organizers labeled as radicals or Northern carpetbaggers. Despite careful planning on various levels, the leadership failed to design an overall strategy that would provide direction, framework, and purpose.

Initially, CIO and SOC leadership had hoped to rekindle the militancy of the 1930s. Soon, however,

Operation Dixie evolved into a campaign that was not about a militant crusade, but one that resembled more of a business proposition. Conservatives dominated Southern congressional delegations, and their ranks received a boost with the election of more Northern Republicans to Congress in 1938 and 1942. In addition, no effort was made to build upon the already existing CIO Communist-led, biracial unions in logging, tobacco, food processing, and woodworking. Lurking in the background throughout the duration of Operation Dixie were the politics of anti-Communism. Ultimately, this combined with the insistence that the campaign not mix organizing with politics, thereby rejecting the notion that Operation Dixie would link itself with any crusade for civil rights. The organizing drive focused almost exclusively on the white worker-dominated textile industry and largely ignored lumbering, pulp and paper, tobacco, and other industries where great numbers of African Americans were employed. SOC leaders also actively discouraged African Americans from applying for organizing positions.

This strategic drift complemented employer tactics designed to stymie organizing and reinforce the traditional paternalism that for so long had characterized the Southern employment relations system. SOC leaders relied heavily on the unfair labor practices provisions of the National Labor Relations Act. Even during the 1930s, textile employers had been successful in delaying legal proceedings under the provisions, and during Operation Dixie they refined these practices. Propaganda launched by public officials and local journalists also aided textile employers in the fight against the CIO. Besides playing themes that traditionally had resonated with Southern whites, such as that industrial unionism would bring social and economic equality to African Americans, they also asserted that a CIO victory would destabilize the South's institutions and destroy regional economic progress. The result was a failure by the SOC to establish strong, local unions, identified in the beginning by CIO leadership as key to a successful campaign.

Meanwhile, a string of National Labor Relations Board (NLRB) election defeats in the textile mills added woes to a campaign that already was under serious financial stress. By the end of 1946, it was clear to CIO leadership that Operation Dixie had failed. Refusing to link the growth of industrial unionism in the South to the African-Americans' struggle for civil rights, CIO leaders played into the hands of the Southern economic elite, who already had a wealth of experience in deploying the issue of racial equality to divide Southern workers.

Within the context of the politics of anti-Communism, which loomed increasingly important in the internal affairs of the CIO, the fact that unions with a heavy concentration of African Americans were Communist-led served to undermine the possibility of success for Operation Dixie. Operation Dixie's failure helped to reinforce the anti-Communism fixation inside the CIO, and as the general public embraced the Cold War political framework, industrial unionism was increasingly challenged.

Taft-Hartley Weakens the CIO

On the heels of Operation Dixie, the CIO focus shifted dramatically toward politics. However, despite increased PAC activity in support of pro-labor candidates, the Republicans scored huge victories in the 1946 congressional and state races. For the first time since 1932, Republicans had control over both the House and the Senate. The public mood had turned decidedly antilabor. The 80th Congress reflected the hostility toward organized labor by escalating efforts to radically alter the NLRA. The result was the enactment of the Taft-Hartley Act, passed over President Truman's veto on June 23, 1947. The major thrust of the legislation aimed at curbing the power of unions and strengthening the hand of employers in resisting unionization.

The legislation incorporated a list of unfair union practices and expanded presidential power in forcing unions to delay strike action. Both the NLRB and employers could seek injunctions against unions, and it allowed employers the right to actively dissuade employees from joining unions. A section of the law allowed states to adopt so-called right-to-work laws, thereby undermining union security and organizing activity. Workers in right-to-work states who benefited from union contracts could now refuse to join unions and not pay union dues. It prohibited union contributions to candidates in primary and general elections, which severely restricted union political activity. Probably more damaging for CIO internal affairs and organizational health was a provision requiring that all union officers and those seeking remedy from the NLRB sign and file affidavits with the Labor Department stipulating they were not Communists.

Although CIO leaders, including President Philip Murray, who spoke out in opposition to what he called the law's "loyalty oath," initially opposed the

GEORGE MEANY (1894–1980)

George Meany, the long-term (1955–1979) president of the AFL-CIO (American Federation of Labor-Congress of Industrial Organizations), spent almost his entire working life as an official in the union movement in one capacity or another. Born the son of a plumber on August 16, 1894, Meany dropped out of high school at sixteen, passed the apprenticeship test for the plumbers union on his second try, and worked briefly in the trade. Despite these humble beginnings, he became the leader of the AFL-CIO, a remarkable accomplishment for a man who proudly proclaimed that he had never walked a picket line or led a strike.

In 1917, Meany joined Plumbers Local 463 in New York. Typical of AFL unions of that day, the organization's chief mission was not recruiting members or organizing new locals, but controlling the supply of plumbers in order to set wages. AFL unions in general represented only skilled craftsmen and excluded recent immigrants, people of color, and women—policies that persisted throughout Meany's tenure and beyond. Meany was elected business agent of Local 463 in 1922 and secretary of the New York City Building Trades Council a year later. In 1934, he was elected president of the New York State Federation of Labor, a position he retained over five elections. He was politically astute and influential with the state legislature, shepherding the passage of seventy-two pro-labor bills.

During the 1930s and 1940s, Meany's influence with the Democratic Party grew. As part of the Franklin D. Roosevelt coalition of liberals, labor, ethnic minorities, and Southern Democrats, Meany delivered the votes of its unionized skilled trades workers. In the 1930s, the AFL was challenged by the CIO, a new federation that emerged to unionize industrial workers, a constituency previously ignored by organized labor.

In 1939, Meany rose to the position of secretary-treasurer of the AFL, a position he held until the death of AFL president William Green in 1952. He was then elected president of the AFL by its executive council. His major accomplishment occurred in 1955 when he helped engineer the merger of the AFL and CIO. Subsequently, he was elected unanimously, essentially appointed by the executive board he controlled. Meany was a chief proponent of "business unionism"—the concept that unions should work in concert with business, eschewing strikes and radicalism, working for better wages and benefits, and defending only its members, within the capitalist system. A rabid anti-Communist, Meany practiced an essential conservatism that led him to grow increasingly out of touch with the needs and aspirations of the rank-and-file. Although he saw himself as a foreign policy expert, his staunch opposition to cooperation with Communist China and the Soviet Union and his support of the Vietnam War put him far to the right of most of his constituents and the Democratic Party by 1972.

Meany's statements on international affairs throughout the era resound with warnings against "appeasement" at nearly every turn, demonstrating how even pre-World War II events deeply influenced the thinking of Americans. The blend of historical events which included World War I, the Bolshevik Revolution in Russia, and subsequent events in the Soviet Union, the interwar years, World War II, and especially the Cold War dramatically influenced the way Americans, and especially influential leaders like George Meany, came to view the world around them. Meany sincerely believed that a monolithic international Communism was out to conquer the world and that it was the AFL-CIO's duty to involve itself in international affairs to help counter this threat. He was able to convince the majority of leaders within the AFL-CIO that this was so. Meany did not answer directly to the rank-and-file, having been, in essence, appointed as president for life by his executive board. In turn, he controlled the board that kept him in power. He supported American policy in Vietnam during the Johnson and Nixon administrations, disregarding the growing opposition within his own organization and among the American workers he represented.

Meany's tenure saw the number of unionized American workers rise to over 30 percent. It also witnessed the decline, by 1971, to 22 percent. By the end of his career in 1979, he was clearly an anachronism and was even partially responsible for the decline of the union movement in the United States. In his early years, he espoused organizing the unorganized, but by 1971 he declared organizing useless and unnecessary. In 1972, Meany declared the AFL-CIO's neutrality in the presidential election between Republican Richard Nixon and Democrat George McGovern, contributing to Nixon's landslide victory. Though initially supportive of Nixon and especially his policies on Vietnam, he later turned on Nixon after the Watergate scandal, demanding his resignation or impeachment. In 1979, Meany declined to seek reelection to the presidency of the AFL-CIO, and he died the following year at age eighty-five.

Frank Koscielski

signing of non-Communist affidavits, foreign policy issues and domestic loyalty soon trumped CIO unity on the issue. As public debate concerning the containment of Communism abroad and the threat of subversion at home intensified, tensions between pro-Soviet and anti-Communist elements in the CIO sharpened. When Walter Reuther became UAW president, he convinced the UAW executive board to sign the affidavits. Other CIO unions followed, and on July 29, 1949, Murray reluctantly signed an affidavit, leaving the Communist-dominated UE, Mine, Mill, and Smelter Workers, Farm Equipment Workers, and Food, Tobacco, and Allied Workers' unions the only holdouts.

Walter Reuther then began to aggressively employ the affidavit against the nonsigning unions and attempted to raid their membership, especially the UE and the Mine, Mill, and Smelter Workers. The UE, at least initially, successfully fought off the raids, due to its leadership and resources. Soon, however, rival factions within the UE emerged, and James Carey challenged its leadership. After the UE completely broke with the CIO in mid-1949, President Murray chartered an electrical workers' union, the International Union of Electrical Workers (IUE), to compete against the UE. During raiding activity, the IUE received critical support from the Roman Catholic Church and the Federal Bureau of Investigation, as well as from Carey's testimony before the House Committee on Un-American Activities, popularly known as the House Un-American Activities Committee (HUAC), which conducted investigations into Communist subversion of American institutions, including Hollywood and the Screen Actors' Guild. Although unions like the UE survived, they emerged from the raiding wars battered. This process alone contributed heavily to the overall weakening of the CIO. The AFL, meanwhile, absorbed affiliates and members while charting steady, organizational growth during the period. By the early 1950s, this factor, along with others, led CIO leaders into serious discussion concerning the possibility of merging with their rival.

The Realpolitik of Merger

Besides the problems associated with the politics of anti-Communism, CIO postwar leadership faced the challenge of the changing dynamics of the American workforce. CIO leaders proved unprepared to deal with the growth of the service, white-collar, and other nonindustrial sectors. With manufacturing saturated, AFL unions successfully outmaneuvered the CIO in organizing workers in the goods-handling, white-collar, and public sectors. As the AFL expanded, it also began drawing former CIO affiliates into its ranks, especially among packinghouse, textile, food, and chemical workers. In addition, the growth of skilled jobs in the metal trades, particularly in small shops, made tool-and-die makers and millwrights look to the traditionally craft-oriented AFL for affiliation. By 1950, the AFL legitimately claimed double the membership of the CIO. The only consolation for the CIO was the success it enjoyed enlisting the Communications Workers of America (CWA), which included a large number of telephone operators, the overwhelming majority of whom were female.

Although CIO attacks on the AFL's racial policies were still credible, by 1950 the AFL counted more black members than the CIO. This occurred despite the CIO establishing itself as a significant force in the national civil rights legislative initiative. The CIO wrote an *amicus brief* for the Supreme Court in *Brown v. Board of Education*. Strong rhetoric and civil rights statements from CIO leaders like Walter Reuther did not correspond to how the federation's affiliates treated African Americans in the workplace. The UAW, for example, did nothing to break the monopoly white workers enjoyed in the skilled trades. In contrast, AFL leaders like George Meany, although part of the racially exclusive building trades, had at least established good relations with black unionists, such as A. Philip Randolph, head of the AFL-affiliated Brotherhood of Sleeping Car Porters. In addition, Meany and the AFL supported the contours of the CIO's liberal, legislative agenda, including civil rights and an expansion of New Deal-type social reforms.

Other factors also contributed to the drift toward merger. In the area of foreign policy, CIO leaders, while supporting the government's anti-Communist crusade, and in particular the Central Intelligence Agency (CIA) overthrow of Jacobo Arbenz Guzman in Guatemala in 1954, never penetrated the inner circle of established, international AFL operatives, relegating the once rebel federation to a marginal role. Like their AFL counterparts, however, CIO leaders saw Communist influence fostered by the Soviet Union behind every movement of economic nationalism and independence in the Third World during the Cold War years, a factor that would end up damaging the labor movement in future years.

Most importantly, the CIO had long abandoned the militant and confrontational approach toward employers, and by the early 1950s it had embraced the long-standing AFL philosophy of order and discipline

in the workplace. CIO leaders enthusiastically backed employer prerogatives to boost productivity and economic growth. The CIO exchanged the notion of spontaneous protest for higher wages and benefits and shop floor peace. Over the years, the CIO had gradually adopted this position, playing a critical role in the establishment of the modern system of collective bargaining and industrial relations. In 1953 and 1954, the AFL and the CIO signed important no raiding agreements, which served as precursors to their eventual merger in December 1955. In the end, the unification represented a general consolidation of organized labor's public activity, rather than an agreement concerning organizing, particularly as it existed in the legislative and political arenas, which long before 1955 had arrived to dominate the agenda of both federations.

Conclusion

The emergence of the CIO during the height of the Great Depression provided hope for hundreds of thousands of American workers during one of the nation's most turbulent periods of history. The CIO rekindled the labor activism of the early twentieth century that had been submerged by an aggressive employer counteroffensive during the 1920s. When the United States entered World War II, CIO leadership successfully channeled that labor activism into fostering productivity, which exercised a significant role in the defeat of the Axis powers. That process contributed heavily to the growth of collective bargaining and the establishment of a formal industrial relations system. The CIO also immersed itself in politics, and in so doing, it gave the nation's working class its first coherent and effective voice by creating a modern political action vehicle, which has endured to the present day. Its political action arm, especially after World War II, was key in the struggle for civil rights. In the years immediately before the merger with the AFL, the CIO political program incorporated a legislative agenda that provided one of the cornerstones of American liberalism.

Through the channeling of labor activism into institutional structures such as collective bargaining, and along with it the acceptance of government regulation, the CIO did limit the exercise of workers' power. This also resulted from CIO insistence that it participate as a player within a Democratic Party coalition, rather than exercise political independence, such as the brand exhibited by John L. Lewis in his opposition to Franklin Roosevelt in 1940. In addition, CIO acceptance of Cold War policy in the Third World and its congruence with the AFL on what constituted labor internationalism eventually contributed to the erosion of union membership at home. American corporations gradually began to locate production in countries where anti-Communist regimes guaranteed a more pliable and docile workforce.

In the final analysis, however, the CIO dramatically improved working conditions for vast numbers of laborers toiling in American industry. Through collective bargaining it helped to establish higher standards of living and, in the process, elevated the social status of ordinary working people. Autoworkers, steelworkers, rubber workers, electrical workers, and other factory hands earned decent incomes and achieved personal dignity. As a result, their offspring attended college and many moved upward in American society. For those reasons alone, the CIO has to be considered as one of the most important social movements in American history.

Labor Law

Social movements, including the labor movement, affect the development of law. Labor law focuses on *collective* action, addressing issues between organized capital and organized labor. An important distinction needs to be made between labor law and another closely related body of law, employment law. The latter focuses on *individual* workers' rights and issues such as workers' and unemployment compensation, health and safety, wages and hours, discrimination, pensions, and Social Security regulations. Labor law, on the other hand, applies to workers who belong to a union and or are seeking union representation. Strikes create the impression that the battle for labor reform takes place on the picket lines or in the streets; however, most labor struggles are ultimately decided in the halls of the legislature and then, finally, in the courts. Legal cases focused on labor have a long history, but most present laws regulating labor-management relations are rooted in the National Labor Relations Act (NLRA) passed in the 1930s.

Most major legal decisions regarding labor took place after the Civil War. Still, significant cases dealing with strikes and picketing went before the courts before the industrial revolution reached America. As trade and manufacturing advanced in Colonial America, the first labor organizations began to form in occupations such as shoemakers, printers, tailors, and carpenters. The first documented strike in the United States occurred in Philadelphia in 1768 when printers sought a minimum wage of $6 per week. When strikes occurred, employers argued that labor organizations were illegal conspiracies. A conspiracy, according to English "common law," is the collusion of two or more persons to harm the public good. The conspiracy charge was the basis for legal opinions regarding labor in America both before and after the revolution. In addition to limiting workers' ability to fight against low wages and poor conditions, the common-law doctrine helped legalize forced labor systems such as indentured servitude and slavery.

At least twenty-one conspiracy trials were held in the United States between 1805 and 1842. Judges of the period were generally conservative, and they made decisions based on middle-class principles. So, not surprisingly, organized workers only won six cases as judges continued to use common-law conspiracy doctrines as their guiding principles. Because they were attempting to raise wages and reduce hours through "combinations," strikes by workers amounted to conspiracies. Labor organizations were forced to disband and pay heavy fines. The first union to be convicted of engaging in a criminal conspiracy was Philadelphia's Journeymen Cordwainers in the 1806 legal decision, *Commonwealth v. Pullis*. Despite setbacks, workers continued to campaign against the conspiracy doctrine, arguing that it was developed by British judges and had no place in the United States. The efforts proved worthwhile. One of labor's early legal victories came in 1842 in *Commonwealth v. Hunt* in which Chief Justice Lemuel Shaw of Massachusetts held that unions did not amount to conspiracies, even if the union's actions meant lower profits for an employer or a reduction in trade. Gradually, the courts abandoned criminal conspiracy doctrine to prevent unionization, and charges against striking workers based on this area of law slowed in the 1850s and 1860s.

The postbellum period witnessed the development of large labor organizations such as the Knights of Labor and the American Federation of Labor, and the strike emerged as the most significant form of social protest in the United States. A dramatic increase in the number of strikes and large-scale industrial struggles—such as the Haymarket Affair of 1886, the Homestead Lockout of 1892, and the Pullman Boycott of 1894—brought national attention to the problems of labor. The first nationwide strike took place in 1877

when railroad workers struck in the middle of a severe economic depression. There was court action in response to the strikes in the late nineteenth and early twentieth centuries; however, the legal intervention took the form of the injunction rather than conspiracy charges. An injunction is a court order by a judge demanding that certain parties stop performing certain actions which threaten other people's property. The labor injunction was a powerful tool for employers to break strikes, pickets, or boycotts. Injunctions enabled management to circumvent pro-labor juries because the decision to grant an injunction rested solely with a judge—who was often very friendly with capital. When there was picketing or organizing, or even when unions planned to pay strike benefits or operate soup kitchens, employers rushed into both state and federal courts seeking injunctions, claiming that union action caused property loss. An injunction could usually be granted quickly, and any union that defied the order and continued to strike was held in contempt of court. Union officers and members could be punished immediately or thrown in jail.

Labor injunctions were first issued in the 1880s. A key example of the effectiveness of the injunction for capital occurred during the Pullman Strike of 1894. The strike against the Pullman Palace Car Company officially began on Friday, May 11, 1894, although factory workers had been unhappy about wages and rents in the company town for years. The walkout took on a new dimension weeks later when the American Railway Union (ARU), led by Eugene Debs, officially intervened in the strike and refused to handle Pullman cars. When the boycott went into effect, it proved enormously successful. A key moment in the strike came when the courts issued a "blanket injunction" that outlawed any activity that could be deemed as support for the striking workers. Injunctions were also issued against Debs and other union officers. Because the strike continued, the labor leader was charged with contempt of court and conspiracy. Despite the efforts of his attorney, Clarence Darrow, he was sentence to six months in jail. The case is striking because of the involvement of the U.S. Supreme Court. In the case *In re Debs,* the Supreme Court upheld the use of the blanket injunction, as well as the conviction of Debs and other union leaders. With support from the courts, the use of injunctions in labor disputes on both the state and federal level increased from 1890 to 1930. In the late 1890s and early 1900s, some state and federal anti-injunction bills appeared. However, the Supreme Court again struck a blow against labor by declaring these laws unconstitutional.

Labor did gain some strength in national politics during the Wilson administration (1913–1921). For example, the Department of Labor, which was originally formed as a branch of the Department of the Interior in 1884, was elevated to cabinet status in 1913 with a mission to "foster, promote, and develop the welfare of wage earners." Labor made gains in the courts as well. In the past, employers had used government regulations such as the Interstate Commerce Act of 1887 and the Sherman Antitrust Act of 1890 as an antistrike tool. The acts were intended to discourage monopolies and trusts, but some courts also deemed the normal activities of trade unions as "restraint of trade" under the antitrust legislation. For example, when a strike by New Orleans longshoremen began, the United States attorney won an antistrike decree by claiming that the unions were blocking interstate and foreign commerce. Finally, in 1914, Congress enacted the Clayton Act which provided some protection for organized labor by declaring that antitrust laws did not apply to unions since "the labor of a human being is not a commodity or article of commerce." In 1926, another step forward for labor occurred with passage of the Railway Labor Act, which required employers to bargain collectively with unionized workers employed with interstate railroads. Unions also learned to use the injunction to its benefit in the opening decades of the twentieth century. A small number of pro-labor injunctions were issued to forbid lockouts or blacklisting. Injunctions were also issued on labor's behalf to keep employers from breaking collective agreements. Advances were also made in the courts regarding picketing. In the nineteenth century, state courts took the position that all picketing—a major weapon of the worker—was illegal. By 1930, however, state courts allowed peaceful employee picketing.

When the United States' economy collapsed in 1929, conditions resulted which encouraged organization by both the unemployed and employed. Workers demonstrated, picketed, and formed unions. Faced with an increase in radicalization among the masses, the 1930s witnessed great gains for unions and the right to organize and strike. The first hint of change came with passage of the Davis-Bacon Act in 1931, which required that construction contracts entered into by the federal government specify a minimum wage to be paid to persons employed under those contracts. The closing year of the Hoover administration in 1932 was marked by passage of the Norris-LaGuardia Act. The legislation became known as the Anti-Injunction Act because a key provision, Section

4, barred federal courts from issuing injunctions against labor unions and individuals. The act also made the "yellow-dog contract" (which forced workers to promise not to join a union or discontinue union membership) unenforceable in federal court. In general, if there was a labor dispute, the injunction had been removed from the employer's arsenal. They could still obtain injunctions from state courts; however, several state legislatures followed the federal lead and passed their own anti-injunction bills. The initial impact of the Norris-LaGuardia Act was weakened by court challenges but the Act was finally declared constitutional in 1937.

Following the inauguration of President Franklin Delano Roosevelt in March of 1933, Congress passed the National Industrial Recovery Act. Under the legislation, a friend of labor, Senator Robert F. Wagner of New York, insisted on the inclusion of Section 7(a), which provided that "employees shall have the right to organize and bargain collectively through representatives of their own choosing, and shall be free from the interference, restraint or coercion of employers of labor." Section 7(a) also stated that "no employee and no one seeking employment shall be required as a condition of employment to join any company union or to refrain from joining, organizing, or assisting a labor organization of his own choosing." The inclusion of Section 7(a) in the NIRA represented a substantial shift of economic power to unions. Union membership began to grow, moving from approximately three-and-a-half million in 1935 to over ten million in 1941.

Labor's excitement over 7(a) was dimmed in 1935 when the Supreme Court declared the NIRA unconstitutional. Workers, however, continued to organize and pressured lawmakers to devise a substitute for the labor sections of the NIRA. The result was passage of a bill sponsored by Senator Wagner, the National Labor Relations Act in July 1935, also known as the Wagner Act. The legislation represents one of labor's strongest victories, making illegal a host of management activities that had been previously used against labor. A sampling of unfair labor practices established by the Wagner Act includes:

- threatening workers with job loss for union activity.
- using industrial espionage.
- privately interrogating workers about union membership.
- hiring strikebreakers to engage in violence or create fear in workers.
- using the "Mohawk Valley Formula" (organizing citizens' committees, spreading false rumors, etc.) to break a strike.

Under the Wagner Act, the National Labor Relations Board (NLRB) was established as an independent agency to investigate complaints by unions or employees about possible violations of the NLRA. One weakness of the Wagner Act, according to its critics, is that court orders are needed to enforce NLRB rulings—a time-consuming process. It has also been argued that the Wagner Act has resulted in more union bureaucracy and defuses worker militancy and direct action. Nonetheless, the Wagner Act was clearly a step forward for the working class. Another significant triumph for labor on the legal front in the 1930s was passage of the Byrnes Act of 1936, also known as the Anti-Strikebreaker Law, which made it a felony to transport individuals across state lines as a threat against nonviolent picketing or as a measure against organizing or bargaining.

Labor gains in the 1930s were modified following World War II when a period of antilabor sentiment ensued. The Taft-Hartley Labor Act of 1947 was passed over the veto of President Harry Truman—who felt the measure was antilabor. Taft-Hartley retained most of the basic guarantees of workers' rights in the Wagner Act, particularly provisions dealing with collective bargaining. However, it contained a variety of restrictions and amendments and nullified parts of the Anti-Injunction Act of 1932. Significant provisions of Taft-Hartley include:

- outlawing of the closed shop by which an employer can hire only union members.
- banning the union shop in which all workers must join the union within some time period but need not be members when hired.
- outlawing sympathy strikes and secondary boycotts.
- making excessive or discriminatory initiation fees or dues an unfair labor practice.
- prohibiting strikes against the government.

One of the most controversial sections in Taft-Hartley was Section 9(g), which compelled all union officers to sign sworn statements that they were not members of the Communist Party. As a result of this section, radicals and leftists were driven from unions and some unions were destroyed. Section 9(g) was ultimately amended under the Labor-Management Reporting and Disclosure Act of 1959 (also known as

the Landrum-Griffin Act), but Communists were still restricted from holding union office. The amended version of Section 9(g) was ultimately declared unconstitutional by the Supreme Court.

The Landrum-Griffin Act of 1959 was the result of Senate committee hearings into charges of labor management corruption, including the use of violence by labor leadership and the misuse of funds. The act prevented former Communist Party members from holding union office for a period of five years after resigning membership. A similar provision was included for convicts. It also sought to guarantee union members freedom of speech and freedom of assembly, and it called for the use of a secret ballot for the election of union officers as well as tighter regulation of union funds.

The 1960s and 1970s witnessed a variety of gains for workers in the area of employment law. The Work Hours Act of 1962 provided regulations for overtime. Discrimination was curbed in the Civil Rights Act of 1964 and the Age Discrimination in Employment Act of 1967. Workplace safety rules and inspections were tightened under the Occupational Safety and Health Act of 1970, which created the Occupational Safety and Health Administration (OSHA). Efforts to protect pension plans were launched in 1974 with the Employee Retirement Income Security Act of 1974. In the 1980s, under the Reagan and Bush administrations, attempts were made to reduce labor regulations in an effort to make America's industries more competitive. Few major labor laws were passed in this timeframe; however, in 1990, the U.S. Supreme Court delivered a ruling making it harder for companies to replace union workers with nonunion workers.

Cannery Workers Movement

In his 1939 study, *Factories in the Fields: The Story of Migratory Farm Labor in California,* Carey McWilliams posed the question of why it had been so difficult to organize agricultural-related workers. He contended that until organizers understood that agricultural-related work, which included farm workers and cannery workers, was essentially the same as other factory work, they could not make headway. He argued that the myth of the small farmer remained for many years, but agribusiness was the reality. A number of radical organizations understood this myth, and pioneered organizing efforts among farm workers and cannery workers. They had to overcome a conservative trade union movement that held onto the myth. These organizers had to meet the challenges emanating from the immigrant diversity in the workforce and the power of the growers and food processors. Finally, the organization of agricultural-related workers was inherently connected to United States policy on Mexican immigration, which was a revolving door policy.

History

The struggle to organize cannery workers was always closely linked to that of organizing agricultural workers. Organization was especially difficult because many of the workers were Mexican nationals, who were deported when growing season was over or when the United States economy was in a downward cycle. Both areas employed many women; in fact, the canneries consisted of a primarily Latina workforce. Conditions were abysmal, with low wages, seasonal work, unventilated rooms, and no toilet facilities. Workers often lived in makeshift tents with no running water. With the exception of agricultural unions, most mainstream labor organizations did not admit immigrants into their organizations.

Cannery and Agricultural Workers Industrial Union

Under the auspices of the Communist Party, one of the earliest attempts resulted in the Cannery and Agricultural Workers Industrial Union (CAWIU), which was formed during the throes of the Great Depression. Although workers were competing for fewer jobs, CAWIU led many Southwestern agricultural-related workers strikes throughout the 1930s. A major strike occurred in 1938 against the Southern Pecan Shelling Company in San Antonio, Texas. Southern Pecan was one of the few pecan companies not mechanized because it was more cost-effective to pay low wages to their predominantly Mexican workforce than to maintain machines. When the company tried to cut the already low wages, thousands of workers struck and won a favorable settlement. Since the majority of the workers were women, CAWIU recognized that it was essential for women to play a major role in leading and coordinating agricultural strikes. Important leaders were Manuela Solis Sager, Emma Tenayucca, and Luisa Moreno. All three remained committed to integrating Mexican workers into the organized labor movement and working for social change.

By the late 1930s, the union had led dozens of major strikes. CAWIU's successes were met by the wrath of the growers, who utilized police, national guards, and the legal system against them. CAWIU leaders faced prosecution under California's criminal syndicalism law. The resultant legal battles depleted their meager resources. Although the union was destroyed, its impact was extensive and laid the groundwork for future organizing among agricultural-related workers. Wage gains won by CAWIU's successful strikes amounted to millions of dollars, and workers gained important experience and political knowledge based on these unionization drives.

Cannery workers hurl stones and other objects at guards and strikebreakers during a labor conflict in Stockton, California, in 1937.

La Confederación de Uniones de Campesinos y Obreros Mexicanos

As CAWIU was being crushed, Mexican workers were forming a new independent union, La Confederación de Uniones de Campesinos y Obreros Mexicanos (CUCOM), under the leadership of radicals. The organization grew rapidly, going on to launch successful strikes and win increased wages from the growers. Again, the growers, with all forces of the state at their disposal, sought to destroy the Confederation. To strengthen their position, CUCOM linked themselves to the U.S. labor movement and also joined with labor leaders from the Filipino and Japanese communities to form the Federation of Agricultural Workers Union of America (FAWUA) in 1936. FAWUA's strike efforts met with fierce resistance from the growers, and their efforts to affiliate with the American Federation of Labor (AFL) never came to fruition, due to the resistance of the conservative AFL. In 1938, based on the lessons learned from CAWIU, CUCOM, and FAWUA, radical trade unionists organized the United Cannery, Agricultural, Packing, and Allied Workers of America (UCAPAWA), which affiliated with the newly organized and more militant Congress of Industrial Organizations (CIO). Through its successful campaigns, UCAPAWA went on to become the seventh largest CIO union.

Luisa Moreno

From its inception, UCAPAWA was dedicated to trade union democracy and believed in promoting the leadership of immigrant workers and women workers at all levels. Luisa Moreno, a Guatemalan immigrant with a long history of involvement in labor organizing, was among the founders of the union and served as vice president for many years. Moreno had extensive trade union experience before helping to build UCAPAWA. She had organized cotton workers in Texas, beet workers in Colorado, and 60,000 cannery workers in California. Moreno was one of the main leaders of the Southern Pecan Strike in Texas. Moreno, as other UCAPAWA leaders, clearly understood the relationship between unionism, civil rights, and social change. She consistently argued for the recruitment of immigrants and women and their inclusion as leaders. She helped found the *El Congreso de los Pueblos de Habla Español* (the Congress of Spanish Speaking Peoples) in 1938. The Congress was nationwide and included workers, educators, politicians, students, and artists. Its purpose was to promote understanding between Anglo-Americans and Mexicans, to improve the economic, social, and cultural life of Mexican people, to actively unionize, and to fight all forms of discrimination. Moreno traveled all over the United States promoting the Congress and arguing for the rights of Spanish-speaking peoples. She explained how Mexican workers were constantly being brought to the United States by large growers' associations as a cheap workforce and then sent back, making organizing difficult.

Food, Tobacco, Agricultural and Allied Workers of America (FTA)

Since UCPAWA had made significant gains among tobacco workers, its name was changed in 1944 to the Food, Tobacco, Agricultural and Allied Workers of America (FTA). The plans of the union continued to be the building of strong cannery units, which would serve as a basis for organizing farm workers. FTA served as a model of social unionism as they actively recruited women and immigrants and consciously

groomed them for leadership. Women recruiting women proved to be pivotal to the union's organizing success.

In 1945, backed by the CIO, FTA took on the challenge of organizing cannery workers in central California. This task was made more formidable as they found themselves competing with the AFL-sanctioned International Brotherhood of Teamsters (IBT), who had a condescending attitude toward cannery workers. Utilizing their democratic approach, FTA sought to reach the diverse workforce, which included Chinese, African-American, Italian, Portuguese, and Mexican workers. Multilingual literature was distributed, and multilingual meetings were held. Although FTA overwhelmingly won NLRB certification elections, the IBT retaliated by boycotting canneries under FTA contract. The IBT also won over the California Processors and Growers Association (CPG), who preferred their labor/management accord approach over the more radical FTA. The NLRB elections were challenged, and the IBT began to sign "sweetheart" or illegal contracts.

Because of the fierce anti-Communist, anti-Progressive movement of the Cold War years, especially in the McCarthy era, the IBT and the AFL repeatedly attacked the FTA as subversive. As a result of the 1947 Taft-Hartley Act, which eroded many of labor's gains won through the 1935 National Labor Relations Act, FTA, along with other left-led democratic unions, was expelled from the CIO in 1950, weakening the labor federation considerably. IBT became firmly entrenched among the cannery workers in California.

By 1990, a democratic faction won control of the IBT and attempted to transform the union. IBT still held sway over cannery workers, but during the 1990s, before the union could be democratized, thousands of California cannery and other agricultural-related workers found themselves displaced as plants located offshore. Although regions such as Watsonville, San Pedro, and San Diego enjoyed flourishing food processing industries for almost fifty years, by the twenty-first century, most were gone.

Conclusion

The organizing of cannery workers was intertwined with the organizing of farm workers. These workers were predominantly women and documented and undocumented immigrants. Organizing immigrants was difficult since they were vulnerable and always subject to deportation. During the Depression, many Mexicans, including U.S. citizens, were deported or "repatriated" to Mexico. Despite intimidation, harassment, and the severe economic conditions of the Depression, Mexican workers, especially women, were at the forefront of the trade union movement. Women and Mexican workers coordinated organizing campaigns and formed democratic unions in the cannery and agriculture-related industries. Fierce red-baiting campaigns on the part of the government, business, the church, and conservative unions all joined to destroy these unions in the 1940s and 1950s. At the end of the twentieth century, in the search for cheaper labor, the canning and agriculture-related industries moved offshore, leaving thousands of workers jobless.

Labor Movement 1948–1981

Between the end of World War II and the first Reagan administration, the American labor movement completed a trajectory of growth that began in the 1930s, survived a period of stagnation, and initiated a decline that would continue throughout the end of the century.

After a revival of militancy in the immediate aftermath of World War II, labor retreated from the social agenda it had advanced during the New Deal and accepted the more limited role of bargaining agent for its members. At the labor movements' apogee in the mid-1950s, unions comprised one-third of nonfarm workers. Organized labor was remarkably successful in procuring high wages, pension benefits, and health insurance against the background of Cold War politics and the resurgence of conservatism. These hard-won gains indirectly benefited the whole working class as some nonunion firms followed similar wage patterns.

Looking from the perspective of a steady decline of the labor movement in the past two decades, historians have located the seeds of its downfall in the postwar period. They argue that the labor movement developed into a mainstream institution, which supported corporate capitalism and the Korean and Vietnam wars and abandoned its reformist goals. Critics have also observed that material gains were often achieved only in exchange for increased input on the job—an alienating experience for the average worker on the line.

Labor, during the period under examination, also contended with internal opponents among social groups that criticized its bias toward male and white members. Organized labor accommodated to these pressures in a variety of ways, according to the political inclinations of its various affiliates. However, following the social transformations of the 1960s, discontent also grew among white workers, spurring a series of rank-and-file movements that challenged the industrial order of corporate capitalism.

This agitation diminished in the mid-1970s when the economic crisis and the restructuring of mass production started eroding labor's negotiating leverage and jeopardized millions of jobs. In the 1980s, the Reagan administration put forward a neoliberal agenda that included a direct attack on the prerogatives of organized labor. The managerial offensive that ensued accelerated the decline of the labor movement and eroded its influence in American society.

Labor in the Wake of World War II

The end of World War II opened a period of confrontation between labor and capital that resulted in the refashioning of the system of industrial relations initiated during the New Deal. After VJ Day, industrial unions—mostly gathered under the umbrella of the Congress of Industrial Organizations (CIO)—lifted the No Strike Pledge they had underwritten to sustain the wartime production effort. Fear of a renewed depression among workers, which seemed confirmed by cutbacks in production and plant closures, led to a wave of strikes of a magnitude second only to the one of 1919–1920. Thousands of strikes occurred among automobile, steel, electrical, and coal workers, but also in the shipbuilding, telephone, railway, lumber, meatpacking, and other industries. Industrial workers comprised over two-thirds of the strikers.

The CIO, under the leadership of Philip Murray, saw in the reconversion an opportunity to broaden the role of labor and the scope of its influence in government decision making. However, inside the organization different personalities disagreed on the best way to achieve this goal. Although Murray favored a smooth transition through negotiation with corporations and government, others—and prominent among them was Walter Reuther, head of the United Automobile Workers (UAW)-General Motors (GM) department—preferred a showdown, thereby exploiting workers' willingness to strike. Eventually, this second

WALTER P. REUTHER (1907–1970)

More than any other individual, Walter Reuther defined the structure, mission, and outlook of the United Automobile Workers (UAW). Although he was neither the labor union's founder nor its first president, his influence spans the decades from the years of the Great Depression into the twenty-first century.

Reuther was born on September 1, 1907, to a German immigrant couple in Wheeling, West Virginia, the second of five children. They were strong unionists and staunch Socialists who believed that a Socialist commonwealth would eventually replace the predatory capitalist system extant in the United States in the early twentieth century.

In 1927, Walter moved to Detroit to work in the burgeoning automobile business. After a brief stint at Briggs Manufacturing, a supplier of auto bodies, Reuther landed a job at Ford Motor Company and remained there for five years. Victor, Walter's brother, joined him in Detroit in 1930, and they began working together in the election campaign for Socialist candidate Norman Thomas. Although Reuther eventually abandoned the Socialist cause per se, the ideals of economic and social equality remained.

After Walter was laid off, the brothers embarked on a three-year tour of Europe that eventually led them to work in the Soviet Union's Gorki auto plant for eighteen months. Upon their return in 1935, the two brothers worked at organizing industrial workers for the newly formed Congress of Industrial Organizations (CIO), which organized all workers in a certain industry regardless of skill level or craft affiliation, unlike the long-established American Federation of Labor (AFL). Reuther's skill at organizing and a new weapon, the sitdown strike, brought success to the newly formed UAW. Walter Reuther was elected president of newly chartered Local 174 in Detroit. Organizing successes at General Motors (Flint, Michigan) and Chrysler (Detroit and Hamtramck, Michigan) in 1937 and at Ford in 1941 cemented the UAW as a fixture in the American auto industry. In 1937, Reuther and other organizers were severely beaten by a Ford goon squad in the famous Battle of the Overpass at the company's Rouge River Plant in Dearborn, Michigan. He survived an assassination attempt in 1948 that left him severely wounded.

During the war years, 1941–1945, most unions, including the UAW, agreed to the "No Strike Pledge," which demonstrated union loyalty to the nation while giving up workers' ultimate weapon against employers. Despite the pledge, thousands of unauthorized wildcat strikes took place in the auto plants. The plants had been converted to war production, partially as a result of Reuther's "500 planes a day" plan.

In 1948, Reuther negotiated the "Treaty of Detroit" with General Motors, which gave autoworkers quarterly cost-of-living adjustments and a 2 percent annual improvement factor. An even more generous five-year contract in 1950 expanded healthcare benefits and established a monthly pension plan. The UAW grew in numbers and political clout, especially in the Democratic Party, reaching a peak of 1.5 million members in 1965. In exchange for monetary and benefits packages, however, the UAW gave up control over issues of production, corporate investment, and the nature of the workplace.

In 1955, Reuther helped negotiate the merger of the AFL and CIO. But in 1968, because of personal and organizational differences with AFL-CIO President George Meany, Reuther led the UAW out of the AFL-CIO. Chief among these differences was Meany's conservative views on civil rights and foreign policy, especially the Vietnam War. Reuther had supported U.S. President Lyndon Johnson because of the War on Poverty and Johnson's progressive actions on civil rights and rebuilding the inner cities until late 1967 and early 1968. Reuther's muted opposition to the war alienated both Johnson and Meany, who supported American efforts in Vietnam to the bitter end in 1973.

Reuther was a strong supporter of the civil rights movement and marched alongside Martin Luther King Jr. in Detroit and Washington in 1963.

Walter Reuther died with his wife, May, on May 9, 1970, in a plane crash. They were on their way to view Reuther's final project, an extensive UAW training facility at Black Lake in northern Michigan. Although he can be criticized for his failures, he should be praised for his vision and his attempts to create a just society in which working people could participate in the American Dream.

Frank Koscielski

line proved more popular among rank-and-file workers, who had contended with inflation, wage freezes, and speedups during the war period.

The longest confrontation, and a crucial one for the fate of American labor, was the 1946 General Motors strike led by Walter Reuther himself. The GM strike lasted 113 days and shut all the company's plants. Most were concentrated in Detroit, Flint, Toledo, and Cleveland. The UAW demanded a 30 percent wage increase without a rise in the cost of cars. Reuther claimed that, due to rising wartime productivity and "cost plus" government contracts, GM had the ability to pay, and provocatively asked the company to open its books to a panel of government experts to demonstrate the contrary. Reuther embraced Keynesian economics and argued that only a redistribution of income could forestall another depression by sustaining consumers' spending.

If wage hikes were passed on to consumers, they would undermine sustained growth. He called upon the government to maintain price controls and working-class living standards. President Harry Truman, however, was not going to assume such a role. By not giving full support to the UAW, the president encouraged GM to resist the kind of social ambitions that the labor movement had nurtured during the war. GM manager Wilson, on behalf of the entire business community, upheld the principle that unions should not intrude in management matters such as prices, profits, or organization of work. The GM strike therefore concerned essentially what sphere labor would occupy in the postwar period. Eventually, the UAW's position was also undermined by the settlement of the United Steel Workers and United Electrical Workers—the latter striking against the same employer—who settled with a pay rise of 18.5 cents an hour. Reuther, left with little space for maneuvering, had no alternative but to accept these conditions.

Although the postwar strikes delivered only limited gains in wages, they did show the extent of workers' power and solidarity, even in the face of internal failure to coordinate CIO strategy. The fact that violent clashes with police occurred only in sporadic cases suggested that organized labor enjoyed a greater legitimacy among the general public than before the war. However, subsequent events also showed the fragility of industrial unionism power.

Successes among Southern unions during the war and the desire to revive the organizing spirit of the 1930s led the CIO to announce in 1945 an ambitious drive to unionize the low-wage South—unofficially dubbed "Operation Dixie." With less resoluteness, the craft union–based American Federation of Labor (AFL) also launched its own organizing drive. But wartime success proved ephemeral, and both organizing campaigns faced an entrenched anti-union sentiment not only among employers but among workers too. For the CIO in particular, the failure was upsetting since it had initially committed considerable, though insufficient, resources, together with its credibility. The campaign suffered from dubious strategic choices, which included the privileging of textile industries, the eschewing of the racial question, and the exclusion of left-wing organizers. Operation Dixie dragged on until 1953 when it was discontinued in the face of CIO affiliations dropping out of the drive among the discomfort of the in-field organizers. The AFL had already stopped its drive in 1947.

Taft-Hartley and the Purge of Communists

One circumstance that hindered Operation Dixie was the growing conservative climate in national politics. The onset of the Cold War and the strike wave after VJ Day contributed to create a backlash against labor that gave Republicans the majority in the elections of 1946. For Republicans the repeated strikes exposed the inadequacies of the existing labor legislation, which gave a "monopolistic" power to unions. Employers, too, waited for a chance to reform the Wagner Act. These sentiments resulted in passage of the Taft-Hartley Act. The first major political attack on the New Deal political order, the act marked the transition to the postwar era in labor law. The act sought to restrict unions' influence at a political level and interunion solidarity by banning sympathy strikes, supportive boycotts, and campaign contributions. It complicated the procedure for the union shop and, most important, for the future of organized labor, allowed states to bypass federal law and ban the closed shop. This provision in particular nullified Operation Dixie. Finally, the new law required all union officeholders to sign affidavits affirming that they were not members of the Communist Party. Any union whose officers refused to sign affidavits would lose the protection provided by the Wagner Act and access to the National Labor Relations Board (NLRB) mechanism.

The Taft-Hartley Act reinforced the effect of contracts stipulated at industry level in seriously delimitating the union's space for maneuvering both at the national level and on the shop floor. The clause that allowed the U.S. president to seek an injunction end-

No law was more universally despised by organized labor than the 1947 Taft-Hartley Act, which banned sympathy strikes and the closed shop and curtailed union influence nationwide. In this 1953 cartoon, labor leaders John L. Lewis, Walter Reuther, and George Meany ride a horse with an axe head, galloping toward the Taft-Hartley Act in hopes of chopping it down and repealing it. *(Library of Congress)*

ing strikes that "imperil the national health," though never seriously implemented, lowered public support for unions by portraying them as selfish economic actors that were harmful to the nation. The act, by redefining the term *employee* in a way that excluded foremen, impaired the efforts of this category to build up a union in the form of the Foremen Association of America. As historian Nelson Lichtenstein has demonstrated, the foremen's efforts to build a union drove them increasingly into a collaboration with the CIO, thereby depriving management of the fundamental instrument to regiment rank-and-file. Manufacturers' victory in keeping foremen strictly on management's side represented an insurmountable limit for the expansion of unions' rights to other categories. The cumulative effect of the provisions in the new labor legislation was to discourage unions from pursuing a strategy of structural reform of the American political economy.

The Taft-Hartley Act and the announcement of the Truman Doctrine of worldwide containment of the Soviet Union opened a period of internal struggle within the CIO that resulted in the purge of Communist-led unions and Communist officers. Although Communists were only a minority within the CIO, they played a major role in the 1930s in building the organization. They occupied key posts in the United Electrical, Radio and Machine Workers (UE), the Food, Tobacco, and Allied Workers (FTA), and the International Longshoremen's and Warehousemen's Union (ILWU). Other unions, such as the UAW and the United Packinghouse Workers of America (UPWA), counted staunch Communist locals in their ranks. During the Cold War, the presence of Communists became a central issue. On the one hand, the CIO became increasingly enmeshed in supporting the Truman administration and its foreign and defense policy. On the other hand, genuine anti-Communists like former UE president James Carey and UAW president Walter Reuther used the issue to win factional struggles on their own turf.

In 1947, CIO affiliates followed a divided course in reference to international politics, for instance, in reference to the Marshall Plan. However, during the 1948 presidential election a split became inevitable as pro-Soviet unions and leaders supported third-party candidate Henry Wallace, while AFL-CIO leaders endorsed Truman. The provision of the Taft-Hartley Act that decertified from the NLRB unions whose officers did not sign the anti-Communist affidavit played into the hands of Reuther and the like because it made "Communist" unions more vulnerable in relations with employers and to takeover by other unions. During 1948 and 1949, for instance, the UAW raided UE and Farm Equipment (FE) locals. In the same period, the CIO expelled many affiliates with Communist leadership or orientation, thereby losing hundreds of thousands of members and some of the finest organizers. The AFL, on the other hand, had no record of Communist infiltration, and it had enthusiastically adopted the anti-Communist affidavits. In the Cold War period, in collaboration with the State Department and the Central Intelligence Agency (CIA), the AFL played an important part in undermining Communist unions in Europe and in creating the International Confederation of Free Trade Unions. In the process, labor became part of the liberal establishment by consolidating its alliance with the Democratic Party, especially through the activity of CIO's Political

Action Committee and AFL's League for Political Action. The Communist purge therefore defined the character of labor for the next twenty-five years and opened a period that is often called the Corporate Consensus, in which organized labor participated in the American government's program of military spending and Communist containment abroad, reaping the benefits of the economic boom at home.

Collective Bargaining and the Postwar Liberal Consensus

The Korean War can be considered the beginning of a period of maximum fortune for organized labor. In these years the two characters that defined postwar labor ascended to a presidential position in their respective organizations: George Meany in the AFL and Walter Reuther in the CIO. During the Korean War, labor renewed its commitment to the Democratic foreign agenda, but contrary to its stance in World War II it did not consent to a no-strike pledge. Therefore, during the Korean conflict the system of industrial relations developed into its mature form, according to the lines already designated by the 1946 UAW-GM contract.

In that instance, the automobile manufacturer had expressed the employer's concern to limit the scope of collective bargaining to matters deemed not critical to management efficiency. The control of the production process on the shop-floor level was the most important sphere from the managerial point of view, for it invested its prerogative to determine the production output and its cost. The existence of collective bargaining rested on the shared assumption between unions and manufacturers that it would have to be enacted at the expense of shop-floor bargaining. In fact, by specifying workers' rights on the shop floor through a contract, unions and manufacturers also severely limited them. This system, which historians have called workplace contractualism, regulated workers' discontent with a grievance procedure articulated in several steps. At every stage, union and management negotiated to solve the problem according to the contract. Often the way a grievance would be solved depended on a *quid pro quo* between the two sides, and not on conformity to an abstract rule. For instance, management could revoke a disciplinary action toward a worker if the union, in exchange, pardoned an increase in the work pace. If the grievance could not be solved at the lower level of the hierarchy, it would go higher up, until, eventually, it would be submitted to arbitration by a neutral third party with a binding decision.

There is little discussion that the grievance procedure, as it was implemented, aimed at neutralizing potential disruptive conflict on the shop floor. It buttressed management control of the workforce and production process because it left unions with only one legitimate instrument to counter an adverse managerial decision: to file a grievance. This system was also in itself ineffectual in attacking inequalities in the workplace inasmuch as union officials and managers could, in practice, simply ignore a grievance. Finally, the sheer volume of grievances granted that only a small proportion would be submitted to every step of the procedure.

Collective bargaining pursued economic efficiency and orderly industrial relations by rendering most types of job actions illegal during the life of the contract. It transformed shop stewards into guardians of the rank and file insofar as they had to restrain actions that violated the contract. Collective bargaining also affected the internal organization of unions, as only full-time officials could administrate the complex body of contract rules. Officials at the local level were responsible for the application of the contract for the central organizations. A UAW bylaw required three conditions for a strike: that the conflict could not be solved through the grievance procedure; that the strike be voted by a majority of the local members; and that the strike be approved by the International Executive Board. Collective bargaining therefore reinforced the decisional power of the hierarchies at the expense of the rank and file, although always within a system formally committed to internal democracy.

By 1950, unions such as the UAW had completed their trajectory from a catalyst of mass movement to pillars of the social order based on the "Corporate Consensus." The CIO had joined the AFL in definitely abandoning more radical aims in order to co-manage a capitalistic economy base on the assumption of a constant growth of the auto industry and a national prosperity underpinned by the Cold War "military-industrial complex." The CIO slogan "What's Good for America Is Good for the CIO" is telling in this respect. The 1950 UAW-GM contract has been traditionally regarded as the most significant example of this trend. The contract included a $125-a-month pension and a cost of living allowance (COLA) linked to inflation. Most remarkably, the contract ran for the unprecedented length of five years.

The press hailed the agreement as the "Treaty of Detroit," and it was compared to as sweeping an in-

novation as Ford's five-dollar day. Reuther boasted that the contract was "the most significant development in labor relations since the mass production industries were organized." The UAW proved that organized labor was able to provide a high standard of living for the working class, without impairing manufacturers' growth. Indeed, as in previous UAW-GM contracts, the "Treaty of Detroit" was a trendsetter not only in the auto industry, but also in the entire manufacturing sector. COLA soon spread to all major union contracts and, as inflation increased, to Social Security pensions and even some nonunion contracts. However, the contract also marked the end of the union's effort to intervene in the management of the industry—the four-year-old request to "open the books" seemed four decades away—and testified to the end of the liberal hope for an expansion of the welfare state by accepting a company-centered welfare.

Operating in a high-technology and high-profit sector, the UAW broke ground in achieving the material betterment of its workers, but in all the manufacturing sectors, unions successfully expanded health insurance, pension plans, unemployment benefits, and, in particular, wages, which for the average workers rose, in real terms, 31 percent between 1950 and 1965. Outside the CIO, the United Mine Workers, led by the legendary John L. Lewis, negotiated in 1947 a forward-looking medical fund to protect miners from the frequent work-related injuries and diseases. In the 1950s, only a few radical observers contradicted the common wisdom that the American worker had entered the middle class. Suburban residential patterns and the constant growth of consumers suggested that the American worker was integrated into the system. On the other hand, the upsurge of white-collar employment, which in 1956 surpassed blue-collar employment, pointed to a future disappearance of the traditional working class.

Organized labor's successes in collective bargaining concealed its inability to put forward a social welfare agenda at the national level. Labor turned toward firm-based benefits because plans for a public health-care program had plummeted by 1949. By doing so, labor created in the manufacturing sector a privileged working class disinterested in advancing the social legislation liberals sought for lower-income groups in the segmented U.S. labor market. There was an "Other America," in the words of writer Michael Harrington, that did not reap the benefits of the expanding U.S. economy as union workers did. Furthermore, the failure to shift welfare items from the collective bargaining agenda to national politics impeded further gains in wages and working conditions.

Efforts to repeal the brakes imposed by the Taft-Hartley Act were also unsuccessful, and actually labor stood on the defensive during the 1950s against further Republican attacks to union rights. Finally, within the private sector, even the most powerful unions like the UAW and the United Steelworkers of America (USWA) failed to curb employers' resistance to a guaranteed annual wage and a shorter work week.

The 1950s: Labor in the Affluent Society

The 1950s were therefore at the same time years of achievement and years of stagnation for the labor movement. While in absolute terms, the number of unionized workers increased, its proportion in the total workforce actually shrank. In 1954, for instance, union membership stood at about 17 million and represented 34.7 percent of nonagricultural workers. By 1968, although the first figure had risen to almost 19 million, it represented only 27.8 percent of the labor force. Also responsible for this development were the managerial strategies of development and restructuring in key unionized sectors, such as automobile, steel, and meatpacking. Manufacturers consented to the unions' presence only grudgingly and, even if they accepted the unions as bargaining partners, they endeavored to find ways to undermine their clout. At the industry level, this meant mainly experimenting with technology that would reduce the need for human labor while augmenting production. In the late 1940s, the specialized press dubbed this phenomenon "Automation"—a term that soon appeared in virtually every discussion on the future of American manufacturing.

When Ford introduced automation in 1947, it meant the operation of automatic transfer machines that would move material between different lines without the employment of workers. However, automatic devices gradually spread in many industries, substituting for workers in a number of occupations. Mechanization threatened both skilled and unskilled workers but exacted a greater toll among the unskilled as it often concerned labor-intensive operations. Automation changed the American industrial landscape in many ways that affected the labor movement. Since it required an initial large investment for its introduction, automation favored the tendency of American capitalism toward further concentration, as smaller manufacturers who could not afford the

technology lagged behind in productivity and were eventually driven out of the market. Unions in the industrial sector therefore confronted increasingly powerful corporations.

Automation caused the quick obsolescence of plants. The new transfer lines worked best on a large horizontal surface area. Manufacturers always preferred to build new plants on cheap land outside large urban centers rather than to renew the old multistory plants. Furthermore, they used this opportunity to increasingly relocate their operations to areas with low levels of unionization, leaving the old industrial heartland deindustrialized, with terrible social and economic consequences. These developments therefore eroded unions' power precisely in those segments of the labor market in which they were supposed to be strong. In the long run, more than any other strategic or organizational mistake, it would be the restructuring of the industrial economy that would weaken unions' leverage in the political arena.

By the mid-1950s, labor had become an established component of the American polity. Organized labor claimed 18 million members, and of these, 9 million belonged to the AFL, 6 million to the CIO, and the rest to independent unions such as the UMW and the railway brotherhoods (these figures, however, were probably inflated). However, labor would have to overcome its many divisions if it was to countervail in the long term the powerful anti-union forces. Efforts to mend the separation between the different components of the house of labor were in vain during the late 1930s and the 1940s, but in the 1950s the original antagonism between the AFL and the CIO had diminished as the difference between craft and industrial unionism faded in the bureaucratization of the postwar labor movement.

The ascendancy in 1952 of the first Republican president since 1933 prompted the two organizations to look for a greater unity. Truly, Reuther and Meany were two different men: Reuther was committed to pursue a social democratic agenda, whereas Meany was a bread-and-butter unionist who proudly declared that he had never led a strike. However, both fitted C. Wright Mills's characterization of "managers of discontent" insofar as they were instrumental in channeling working-class insurgency into mainstream institutions.

Two obstacles that had precluded the merger in the past—the respective charges of Communist influence in the CIO and the negative record of racketeering in some AFL affiliates—became less conspicuous. As we have seen, by 1950 the CIO had purged its Communist affiliation and was a leading supporter of anti-Soviet politics. In 1953, the AFL moved to attack illegal practices in the International Longshoremen's Association (ILA), especially in its power base on the New York docks (whose underworld was depicted by Elia Kazan in the controversial 1954 film *On the Waterfront*). Failing to meet the requests of the federation regarding the transparent system of paying and the employment of officers with clean police records, the ILA was finally expelled from the AFL later that year.

The AFL and the CIO eventually merged in 1955 after having settled (though not in a definitive way) the thorny matter of AFL raiding on CIO locals and (rarely) vice versa. Since the AFL was the larger of the two, the presidency was assigned to Meany. On the other hand, Reuther contented himself with being a vice president in charge of the Industrial Union Department where he thought he would be in control of the resources necessary to launch a new organizing drive. In fact, he saw in the merger the opportunity to revitalize the campaign to organize the unorganized, which had stalled since the end of Operation Dixie. Reuther thought that the merged federation could amass $15 million and organize up to 4 million workers in a few years.

In the end, the merger did not open the road for such a development, and organized labor did not move forward, but instead continued to stall. The AFL-CIO never initiated the kind of momentum that Reuther envisioned. Meany persevered in the customary AFL skepticism of central organizing. He thought this was best left to single unions or to workers themselves: they would have joined unions if they wanted to. Frustrated by the many obstacles he encountered in the AFL-CIO, Reuther in 1967 temporarily brought the UAW into an alliance with the Teamsters, charging that the federation lacked "the necessary vitality, vision, and imagination, as well as social invention to make it equal to the challenging problems of a changing world."

This coalition was short-lived because the two organizations represented two different types of unionism: the UAW was one of the most forward-looking, democratic, and reformist unions; the Teamsters, though equal, or bigger, in size, had not severed their ties with organized crime that had caused their expulsion from the AFL-CIO in 1957. The Teamsters adopted dubious practices in their organizing raids and were politically on the other end of the spectrum, being close to the Republicans.

THE MERGER OF THE AFL AND CIO

After nearly twenty years of union rivalry between the American Federation of Labor and the Congress of Industrial Organizations, organized labor in the United States reunified under the umbrella of one federation with the creation of the AFL-CIO in February 1955. The following is the preamble to the new federation's constitution.

PREAMBLE

The establishment of this Federation through the merger of the American Federation of Labor and the Congress of Industrial Organizations is an expression of the hopes and aspirations of the working people of America.

We seek fulfillment of these hopes and aspirations through democratic processes within the framework of our constitutional government and consistent with our institutions and traditions.

At the collective bargaining table, in the community, in the exercise of the rights and responsibilities of citizenship, we shall responsibly serve the interests of all the American people.

We pledge ourselves to the more effective organization of working men and women; to the securing to them of full recognition and enjoyment of the rights to which they are justly entitled; to the achievement of ever higher standards of living and working conditions; to the attainment of security for all the people sufficient to enable workers and their families to live in dignity; to the enjoyment of the leisure which their skills make possible; and to the strengthening and extension of our way of life and our democratic society.

We shall combat resolutely the forces which seek to undermine the democratic institutions of our nation and to enslave the human soul. We shall strive always to win full respect for the dignity of the human individual whom our unions serve.

With Divine guidance, grateful for the fine traditions of our past, confident of meeting the challenge of the future, we proclaim this Constitution.

LABOR AND THE RACIAL QUESTION

One basic issue that had retarded the AFL-CIO merger was their different commitment to racial equality. The AFL had a negative record on civil rights. Although the federation included about 600,000 black workers and one black-led union—the Brotherhood of Sleeping Car Porters—many affiliates continued to blatantly discriminate against African Americans. All AFL skilled craft unions de facto excluded blacks from their ranks, and so did the building trades unions, musicians, papermakers, and others. Apart from generic statements denouncing racism, the federation never disciplined these cases, nor did it allow an extended debate about the issue. The approach of the AFL to racial matters had not changed much since its formative years in the nineteenth century when blacks were not part of the industrial working class.

On the other hand, African Americans had played an important part in building the CIO in the 1930s. By 1945, over 300,000 black workers were members of CIO affiliates. They were particularly numerous in auto manufacturing and meatpacking, so that the UAW and the UPWA became outspoken supporters of civil rights as well as steel and longshoring workers. Postwar industrial contracts helped narrow the gap between white and black workers' income. In 1950, the average African-American income was 60 percent that of whites, compared to 41 percent in 1939. CIO leaders frequently asserted the need to end racial discrimination, though often in the Cold War context of avoiding negative Soviet propaganda.

Upon closer inspection, however, the positive reputation of CIO unions for civil rights was only relative to the situation in the AFL. Although the UPWA systematically fought prejudicial practices and discriminatory contracts, other CIO unions were vocal supporters of civil rights but did not always consistently live up to their own words. The UAW, for instance, staunchly endorsed civil rights legislation, it generously donated to the NAACP, and it created at its internal core a Fair Practices Committee to consider cases of discrimination within the automobile industry. However, its internal hierarchies remained exclusively white. In 1962, the first African American was elected to its executive, but blacks remained grossly underrepresented among the top officers. Similarly, the UAW never challenged its skilled trades practices of racial exclusivity, thereby contributing to keep blacks in the most unpleasant jobs.

Given these precedents, a merger between the two federations sounded ominous to civil rights activists in the labor movement because it also suggested that the CIO would renounce its timid commitment to the black cause. The AFL-CIO convention in 1955 did ratify an article in the constitution that committed the organization to "encourage all workers, without re-

gard to race, creed, color, national origin, or ancestry, to share equally in the full benefits of union organization." However, in the following years, proposals to implement this clause were frustrated by the fact that white delegates from conservative unions dominated the convention. President Meany personally opposed expelling unions that practiced discrimination. To the insistence of A. Philip Randolph, the combative president of the Brotherhood of Sleeping Car Porters, demanding to expand the power of the civil rights committee, he famously replied "Who in hell appointed you as the guardian of the Negroes members [sic] in America?"

Moving into the 1960s, the AFL-CIO continued to refuse to throw its weight to achieve full racial equality in its ranks. Liberal unions such the UAW worked closely with the civil rights leaders. The civil rights leaders acknowledged the UAW's contribution when they called Reuther to share the podium in the 1963 March on Washington where Martin Luther King Jr. delivered his poignant "I Have a Dream" speech.

Meanwhile, the UAW's internal contradictions were exposed in Detroit by the activists of the Trade Union Leadership Council (TULC), who demanded a stronger black presence in the leadership and in the skilled trades. Other liberal unions also came under attack. In 1962, NAACP labor secretary Herbert Hill denounced the International Ladies' Garment Workers' Union for discouraging African-American and Puerto Rican members from running for office. Revelations of discrimination within industrial unions proved even more disturbing than the surveys that showed racial exclusivity among AFL craft unions; the AFL craft unions, after all, had never publicly advanced racial justice. This discrepancy between public statements and private truths increasingly drove a wedge between labor and the black movement.

Women in the Labor Movement

As in the case of African Americans, the labor movement's record in regard to women is mixed. From the outset, trade unions had been male-dominated and male-oriented organizations, and women made inroads into equality only slowly, facing a number of obstacles. The lack of manpower for defense industries during World War II led to increased employment of women, helped question some of the boundaries that defined the gendered division of work in manufacturing, and exposed the arbitrariness of these divisions.

Women adjusted to jobs as welders and assemblers, jobs traditionally reserved for men. As their percentage among the workforce increased many times over, women also entered union politics. In unions such as the UAW and UE, during World War II women represented up to 40 percent of the membership. Their defense production experience prepared women to resist the massive layoffs after the Japanese surrender in 1945. While for men workers layoffs lasted only from the time of reconversion to civilian activities, women workers were often discriminated against and not hired again. In many cases, men with no history of employment were preferred to women with three years of seniority. Employers now asserted that women were not suited for certain jobs.

Although the labor movement acknowledged the problem of sexual discrimination at work, union leadership tended to marginalize women's problems in favor of the demands of the male majority. Verbal commitments to sex equality did not translate into equal access to a position of power in the union hierarchy or in an agenda centered on equal access to jobs for women. As a result of this kind of patriarchal resistance among both managers and laborites, the percentage of women in the industrial workforce shrank to 10 percent by the 1950s.

Thus, women's battle for equality in the workplace had to start inside the unions, with local leadership often proving harder to overcome than national officers. In the UAW, where Walter Reuther sincerely believed in the opportunities for democracy offered by the labor movement, local leaders often ignored recommendations and directives to bargain equal access to jobs or disregarded female workers' grievance against unfair managerial practices. Women's insistence on defending their rights made an impact on the UAW policy. In 1955, the international leadership granted them continuing funding for the Women's Bureau, an independent department from which women could advance their collective bargaining objectives.

In the UE, the largest union expelled from the CIO in the Communist purge, the internal Fair Practices Committee equally fought against sexism and racism, and the union often succeeded in eliminating discriminatory clauses in the contracts. However, few other unions could boast the same commitment to the advancement of women. The ILGWU, a union composed in the majority of women, had a leadership almost exclusively male, and the AFL craft unions did not bother to organize women. Finally, no woman sat on the AFL-CIO executive board.

A breakthrough in the position of women in the labor movement occurred only in the 1970s. The rise

of the feminist movement with its emphasis on gender equality revitalized women's effort inside the unions and gave them greater political leverage. Meanwhile, the unionization of the service sector increased the percentage of women inside the labor movement. In 1974, hundreds of female delegates from all over the country founded the Coalition of Labor Union Women (CLUW) in Chicago. CLUW demanded affirmative action in the workplace to end sexual discrimination, pledged to organize women in the labor movement, and encouraged women's empowerment in the workplace and in the union. Although influenced by the feminist resurgence of the decade, CLUW was fully within the tradition of pressure groups in the labor movement and was successful in exerting influence in the AFL-CIO toward women's concerns and in promoting women to leadership inside their unions.

The 1960s: Labor and Its Discontents

Although discontent grew within its ranks, in the 1960s labor enjoyed a return to grace in Washington. Both John F. Kennedy and Lyndon Johnson shared labor's belief in a Keynesian economy, and under their presidencies the decade became a moment of liberal ascendancy. Kennedy chose as his secretary of labor Arthur Goldberg, a CIO man. Goldberg was later elected to the U.S. Supreme Court, thus giving labor an influence at the highest political level. Kennedy's assassination opened the way to his successor's program of civil rights, social legislation, and government spending—exactly the type of welfare state labor leaders like Reuther had demanded for a decade. Johnson routinely consulted with union leaders and enlisted their support for both the Great Society and the Vietnam War.

The Labor-Liberal alliance was, however, destined to collapse under the thrust of a radicalized civil rights movement and the mounting protest against the war. Johnson's War on Poverty could not redress ingrained economic inequalities without infringing the corporate power that had created them, and this was clearly outside the scope of his administration. Poverty programs instead targeted specific aggrieved groups—which came to be identified with poor African Americans—with insufficient funds to ameliorate their condition, but with sufficient publicity to irritate more privileged sections of the working class. White and ethnic voters, so far the bulwark of liberalism, shifted to the right when they began to believe that the expansion of the welfare state had occurred at their expense but not for their benefit. Urban riots and turbulence in the universities contributed to create the feeling that America was "coming apart" and that a shift toward traditional values was needed.

The escalation of the Vietnam War, together with the growth of Black Power and the counterculture, set the emerging New Left apart from organized labor. Young workers in the factories did not recall the CIO militant organizing days or its postwar battles for social reforms. They regarded unions in a different way: bureaucratic organization disciplining the workforce on the account of the employers; mainstream institutions that supported the war and sanctioned American capitalism.

Not surprisingly, in the wake of the urban riots of the late 1960s, black workers were the first to clash with their unions and to create dissent groups in the workplace. In Detroit, a city where the rapid deindustrialization hit mainly the large black population, black workers at Chrysler organized into revolutionary movements, which coalesced in 1969 under the League of Revolutionary Black Workers. Blending Marxism-Leninism and Black Nationalism, the League demanded better working conditions and more black supervisors and union officers. Its methods—wildcats (unauthorized strikes) and "illegal" picket lines—and its aggressive rhetoric challenged the status quo of labor relations developed throughout the postwar period. Unions—the UAW in this case—moved against these groups with all their strength as they undermined labor's principal negotiating resource: the capacity to govern the shop floor.

American unions were potentially losing the support of a whole generation of workers. The late 1960s and the early 1970s were characterized by a wave of wildcats that challenged both management and the union. Rank-and-file agitation demonstrated that the *labor movement* did not always coincide with the *union movement*. On the contrary, in many cases what triggered the wildcats were not only unbearable working conditions or low pay, but also the bankruptcy of the grievance procedure and of the contractual system of shop-floor representation that did not address workers' problems at the point of production.

Toward the end of the 1960s, when the productivity push coincided with a slowdown of the economy and a number of union concessions on wages and benefits, rank-and-file rebellion spread outside the revolutionary groups of Black Nationalist and young hippies. In some cases, the rank and file built organizations at the industry level to challenge union lead-

ership. The most successful of these endeavors was the Miners for Democracy (MFD). Born in 1969 after the assassination of the opposition candidate for the UMW presidency, Joseph "Jock" Yablonski, MFD toppled the corrupt (and murderous) Tony Boyle in 1972 and proceeded to dismantle the centralized and authoritarian structure of the union. In the Teamsters, the Teamsters for a Democratic Union and the Teamsters United Rank and File sought to achieve the same result but with no success. In the UAW, a union with a more sophisticated and democratic leadership, the United National Caucus—after the defeat of the League of Revolutionary Black Workers—was one of the opposition groups behind the series of walkouts that shut Chrysler plants in Detroit in the summer of 1973. The UAW rationalized the accelerated succession of wildcats in that city as the product of pernicious external influence from Black Nationalist or Communist groups.

At the origin of the protests, there were instead the hazardous safety conditions in the aging Detroit plants and the continuous speedup of the lines necessary to produce the same output of the automated plants of Chrysler competitors. The wildcat summer of 1973 famously ended in Detroit with a clash between the UAW "flying squadron" and the militant rank and file on the picket lines, in which UAW officers carrying baseball bats broke the strike of their fellow workers. As historian Nelson Lichtenstein wrote in *Labor's War at Home* (1987), this episode "symbolized to many the distance traveled by even the most progressive unions of the old CIO."

Unions in the Public Sector

Although unionism had lost its vitality in key industrial sectors, the labor movement did ascend in one important domain: the public sector. Public employees had largely remained unorganized during the 1950s. They were excluded from the coverage of the labor laws, and many of them enjoyed a white-collar status that arguably made them less prone to be organized. Two factors favored the growth of unionism in this sector. First, the surge in public unionism reflected the change in the character of public work. In many cases, government workers were as hard-pressed and burdened as factory workers and not paid as copiously. Second, with President Kennedy's endorsement in 1962 of federal employees' right to organize and bargain collectively, public employees found in state and federal governments a more benevolent opponent than workers in the private sector. By the early 1970s, unions like the American Federation of State, County, and Municipal Employees (AFSCME), the American Federation of Teachers, and other unions of public employees had organized over 4 million workers.

At its height, in 1975, 50 percent of public workers were unionized. With the degradation of the status of public employment, minorities, women, and African Americans had been recruited; therefore, the growth of public unionism also has to be seen in relation to the social movements that saw protagonists in these categories.

Two examples of public employees' militancy are illustrative here. The postal workers' strike of 1970 was one instance of how workers generally reputed to be passive and loyal turned militant in the face of deteriorating wages and job conditions. The strike spread from New York to other cities in the country, even with the threat of severe penalties for its participants inasmuch as they had taken the oath to stay on the job. President Richard Nixon declared a national emergency and called in the National Guard to deliver New York mail. However, the soldiers lacked the necessary knowledge and often sympathized with the strikers, so that Nixon was forced to enter into a compromise with the strikers, delivering substantial improvements in wages and bargaining rights.

The American Federation of Teachers is another example of a public employee union that became more militant during the 1960s. By the late 1970s, it represented the majority of public school teachers. Often under scrutiny during McCarthyism, through strikes and hard-won collective bargaining, teachers achieved better workplace conditions, pay rises, and guarantees against unfair dismissal.

The 1970s: Hard Times for Organized Labor

The rank-and-file movement exposed the many weaknesses of the postwar model of industrial unionism: the bloated bureaucracy; the centralized organization; the parochial political vision; the connivance with employers. Rank-and-file militancy collapsed during the 1974–1975 recession, the worst since the Great Depression, revealing a labor movement ill-equipped to respond to the declining U.S. economy of the 1970s.

In 1974–1975, the U.S. gross national product shrank by nearly 2 percent, and industrial production fell nearly 10 percent. Unemployment rose to its highest level in the postwar era, 8.5 percent, with even higher rates in manufacturing. A rising inflation drove real wages down. The crisis accelerated the re-

structuring of the American economy. In the 1970s, the United States faced global competition from the European and Japanese economies, whose productivity rates during the 1950s and 1960s had grown faster. Competition spurred at home the further use of labor-saving technology (like numerically controlled machines), managerial requests of higher productivity from workers, and a reorganization of the productive structures through mergers, buyouts, divestment, and downsizing.

U.S. corporations in fact increased their investments abroad and moved their production to right-to-work states and to selected developing countries like Mexico, Taiwan, and Hong Kong. The latter trend has been conspicuously increasing in the last thirty years with corporations taking advantage of the perfect union-free environment offered by the free-trade zones around the globe. The first *maquiladoras*—plants in Mexican free-trade zones near the American border—were licensed in 1969 for 72 U.S. plants; five years later the number had become 655, prompting the Mexican government to open new *maquiladoras* farther south from the border. By reorganizing production on an interregional and international scale, manufacturers were able to shake the very foundation of labor's power.

A growing number of manufacturers found an even cheaper way to do business by stopping producing altogether and instead outsourcing production to subcontractors abroad. In these cases, the core of the companies was no longer constituted by the now nonexistent factories, but by swelling headquarters and marketing departments, the only corporate presence to be located on American soil.

The deindustrialization wave of the 1970s exerted a heavy toll on jobs (some have calculated 3.2 million manufacturing jobs lost per year) and destroyed working-class communities. Basic industries such as automobile, steel, and tires have been the hardest hit by this retrenchment. One of the most famous plant closings was the shutdown of the Youngstown Sheet and Tube Company in Ohio during the 1970s, once a large and profitable steelmaking firm. In Youngstown, the New Orleans–based Lykes Corporation that had purchased the firm used the cash produced by steel to finance operations in more profitable sectors: chemical firms, shopping malls, and real estate. Lykes's strategy of planning divestment at Youngstown reflected the growing trend toward achieving profits through financial wizardry and eventually led to the failure of the Sheet and Tube Company.

In Youngstown, considerations of capital mobility and short-term profit presented a formerly thriving community with the social costs of thousands of unemployed. For many of these victims of deindustrialization, the domestic side of "globalization" meant long periods of unemployment, the loss of health insurance and pension benefits, and decrease of self-esteem. For the communities, it meant reduced tax revenues and less money available for social spending, leading to rapid urban decay and the rise of crime.

With its clout in the workforce substantially undermined, labor could not oppose the threats of layoffs and plant closings. Nonetheless, together with the strategic choice to shift production abroad, in the 1970s business started to squeeze labor costs at home. The loss of American economic supremacy and the waning of the liberal coalition prompted manufacturers to extract more concessions from unions and to reverse previous arrangements about wages packages and working conditions. Workers were often asked to sacrifice hard-won gains to cover for management deficiencies. When Chrysler teetered on the brink of bankruptcy in 1979, the UAW agreed to grant $650 million in concessions, thereby breaking the custom of uniform contract in the industry and setting a dangerous precedent of retreat. By the end of the decade, wage cuts, unheard of during the 1950s and 1960s in unionized firms, became increasingly frequent as workers accepted a reduction in their standard of living in the vain hope of salvaging their plants.

These developments accelerated the shift in the labor market from industrial, manufacturing jobs to service employment, thereby cutting the strength of the labor movement at its base. With the loss of well-paid manufacturing jobs and the growth of downtown jobs needed to manage, market, and counsel the restructured economy, American society began polarizing between an upper tier of the labor market inhabited by professionals and a lower tier of underpaid workers: cashiers, janitors, waiters, chambermaids, retail salespersons. An overwhelming proportion of these workers were (and are) low-paid, part-time, and temporary and therefore difficult to organize for a new generation of unionists.

Conclusion: The Reagan Era

After a decade of steady decline in the level of unionization, the election of Ronald Reagan to the presidency signaled the business community that the administration would curb the remnant of labor's influence in the nation. The early manifestation of this policy was Reagan's handling of the Professional Air

Traffic Controller Organization (PATCO) strike. The grievances of the air traffic controllers had accumulated under Carter but exploded during the first year of the Republican administration (they had supported Reagan during the presidential election). PATCO went on strike in August 1981 demanding a pay rise and a shorter work week.

Forty-eight hours after the beginning of the strike, Reagan fired the 11,350 air traffic controllers who had not returned to work and drafted the military to keep Americans flying. For the first time since the 1920s, the government directly attacked organized labor and unabashedly discredited unions in the public opinion. However, Reagan's election was itself related to the rise of neoliberal conservatives, and the restructuring of the economy had occurred in the previous decade.

The defeat of the air traffic controllers' strike opened the door, in the 1980s, to a wave of concession bargaining. In 1982, in a reversal of the "Treaty of Detroit," the UAW and GM signed a new contract that included $2.5 billion in union givebacks. Once again their relationship symbolized the changing character of labor relations. In fact, contrary to Chrysler a few years earlier, GM was a still profitable firm, turning hundreds of millions of dollars of profits, but it could now extract these concessions simply by threatening plant closings and outsourcing.

By the end of the Reagan and Bush administrations, union membership in the core industries had collapsed. The UAW lost 500,000 members, and the USW an equal or superior number. But union membership was also to decline among industries free from foreign competition: construction, food processing, and transportation. As a proportion of the entire workforce, organized labor reached the all-time low of 16 percent in 1991.

From its radical origins in the 1930s, labor moved to become a mainstream institution in the 1950s. However, by the 1980s, this development gradually eroded its bargaining power and finally left it without a political strategy in the face of the economic recession and the loss of influence in Washington. In the following decades, an era that has often been labeled "post-industrial," labor had to come to grips with a society that considered it a marginal institution and often held it in low esteem. Whether labor will recover its lost vitality in the future will eventually depend on its capacity to return to collective action and to reintroduce workers' rights into the national political agenda.

Public Workers Movement

The rise of the public workers movement in the United States is often understood as a product of the social movements of the 1960s. Through that decade, successful organizing campaigns of public sector unions often highlighted a tendency to merge workplace issues with larger community concerns, forging a social movement unionism that transformed labor relations in the United States. Central to the development of this community–labor coalition were the broader demographic shifts in the U.S. workplace, especially expansions in government services, health care, and education, and the increasing numbers of women, African Americans, Latinos, and other groups that had often been overlooked by traditional industrial unionism. Although the growth of public worker unions in the 1960s marked the most powerful moment in the history of these organizations, the origins of this movement have deep roots in U.S. history, with connections to multiple issues such as civil service reform, civil rights, and progressivism.

Nineteenth-Century Public Worker Movements

The earliest movements of public workers in the United States can be traced to the presidency of Andrew Jackson, when hundreds of civilian naval shipyard workers on the eastern seaboard petitioned the federal government for a ten-hour day. Pointing to existing standards in private industry, workers on government contracts lobbied Congress and other federal officials to administer the change in policy, while presenting their cause to the public and organizing isolated strike activity. Through these actions, in 1836, naval shipyard workers succeeded in pressuring federal officials to establish the principle of prevailing wages between government and private shipyards. Four years later, President Martin Van Buren extended this policy, signing an executive order making ten hours the standard in all federal offices. Over the next thirty years, government employees were successful in maintaining these parallel standards in wages, hours, and working conditions. Despite these gains, this early period of government workplace activism did not see the development of permanent workplace institutions, with the causes of government employees represented through the lobbying of national labor federations such as the National Trades Union, the National Labor Union, and regional labor councils.

Government employees were bound in a political environment where job security was linked to the fortunes of political parties and specific political patrons, thus curbing the formation of permanent independent associations. Enactment of the Civil Service Act of 1883 transformed the federal workplace, limiting the power of politics and giving employees a permanent stake in their positions and allowing for permanent workplace organizations. Initial organizing drives came from the federal government's largest service department, the post office. By 1886, numerous branches representing letter carriers were chartered with the Knights of Labor in New York, Brooklyn, Chicago, Buffalo, Omaha, and other cities.

Through their collective efforts, these postal organizations petitioned successfully for changes in hours and wages, leading to the formation of the first national post office union, the National Association of Letter Carriers, in 1890. Other organizations for railroad postal workers and clerks also formed during this time, including the Chicago Post Office Clerks Union No. 8703, the first local made up exclusively of government employees chartered by the American Federation of Labor. By 1900, public worker organizations around the country were expanding to include white-collar federal clerical workers, local schoolteachers, and a wide range of local benevolent societies for police and firefighters.

Government Labor Unions

This rise of government employee labor unions was met with resistance from departmental officers across the federal service. In 1902, President Theodore Roosevelt issued an executive order forbidding federal employees from joining trade associations, an edict that came to be known as the gag rule. For the next decade, this order shaped federal labor relations, curtailing the collective agency of government workers while trickling down to shape anti-union policies in state and local governments. Through these years, federal workers pressed for the overturn of the gag rule through aggressive lobbying efforts and occasional workplace unrest. In 1912, following extensive pressure from the American Federation of Labor, the Lloyd-La Follette Act was passed, overturning the gag rule and assuring the right of federal employees to organize in their own interests. Yet even with this legal precedent, many within the ranks of organized labor understood that the organizational potential of government employees was still far from secure. In 1920, AFL president Samuel Gompers was still cautious about government labor relations, arguing against a platform in support of the nationalization of railroads as a potential threat to the security of railroad union members.

The peculiar relationship of government employees within the ranks of organized labor centered on the question of the legal right of public workers to strike. Standard arguments claimed that, as public servants, government employees did not have the right to strike because their actions would have profound effects by stopping important government functions and threatening the public well-being. This issue came to the fore in 1919 when members of the Boston Police Department, in protest of low wages and excessive work hours, voted to seek AFL recognition. When their demands were not met, 1,200 police officers walked off the job, an act that resulted in several nights of looting and the destruction of millions of dollars of property. In response, Massachusetts governor Calvin Coolidge called out the state National Guard to restore order, issuing the famous declaration that "there is no right to strike against the public safety by anybody, anywhere, anytime." Coolidge's decisive action brought him national prominence, lifting him into the Republican vice-presidential nomination the following year, while the policemen's strike and their union were destroyed.

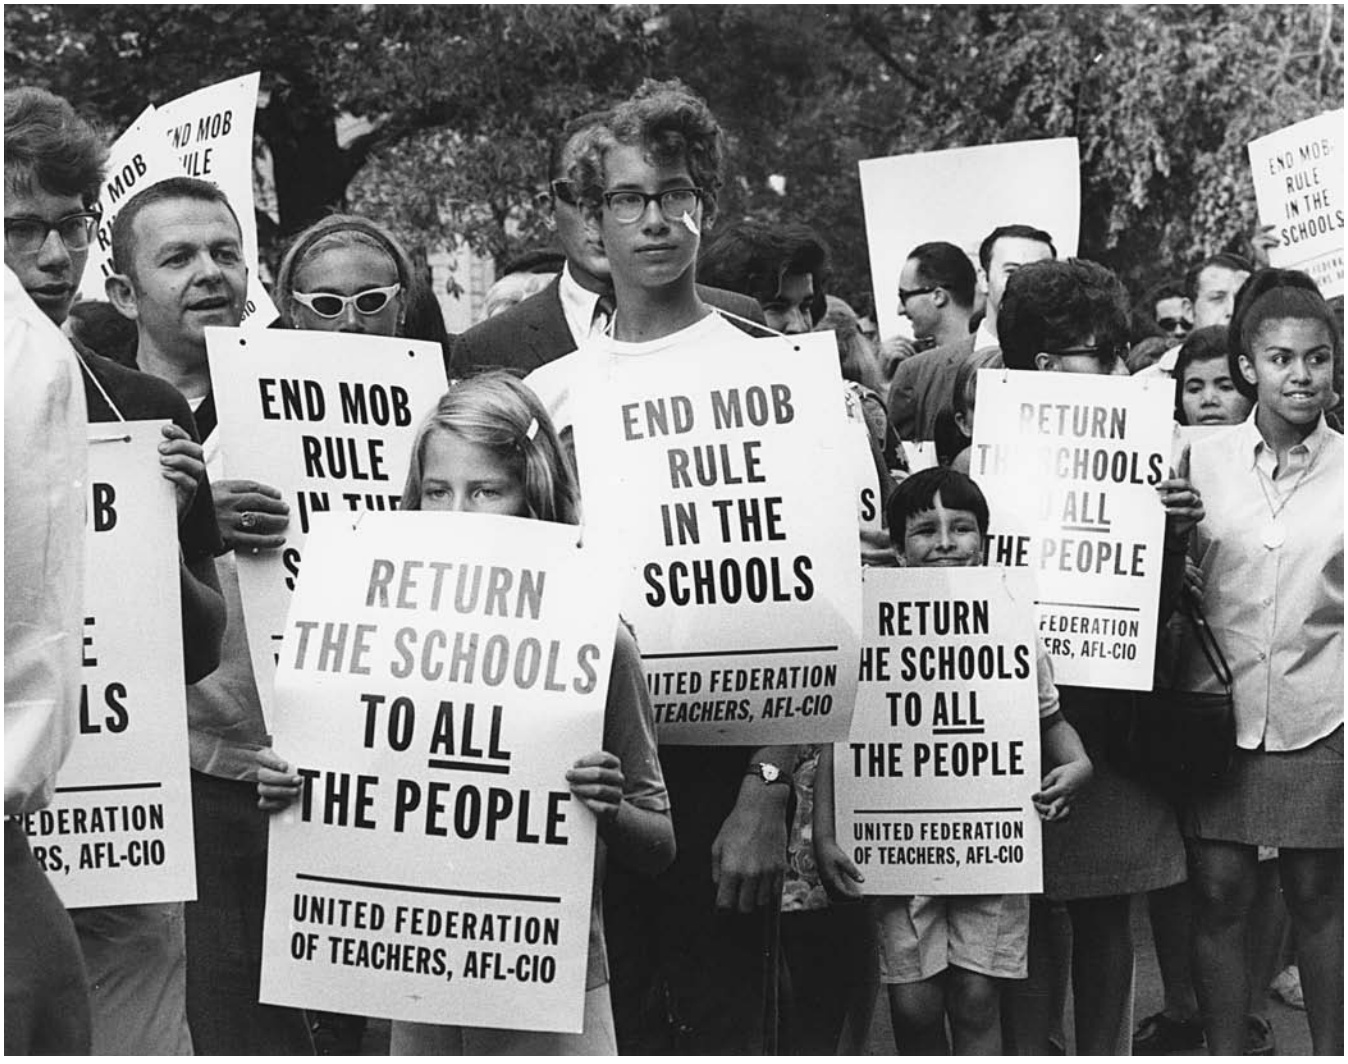
Following the defeat of the Boston police strike, public employee unions across the United States went into decline. However, organizational activities among public workers, at federal, state, and local levels, rapidly increased in the following decade. Although public workers were excluded from the protections of the National Labor Relations Act guaranteeing U.S. workers the right to organize, membership in public worker unions increased dramatically after 1932.

Expansions in federal, state, and local government operations, as a result of New Deal–era initiatives, introduced thousands of young, pro-union workers into government agencies, increasing membership in federal unions such as the American Federation of Government Employees and the National Association of Letter Carriers, as well as promoting rapid growth in the membership of teachers, fire, and police unions. Developments were made in municipal services, with nearly 30,000 workers in New York City's transportation system organized by the Transit Workers Union by 1938, a drive that spread to cities across the United States by the 1940s.

Public Sector Union Organizing

Perhaps the most important development in public sector organizing in the New Deal period came from the rise of local and state organizations into national bodies. The most significant municipal employee union to emerge during this time was the American Federation of State, County and Municipal Employees (AFSCME). Formed in Wisconsin in 1932 following a political upheaval that threatened the state civil service system, AFSCME gained an AFL charter in 1936 and began an aggressive national organizing campaign. Reflecting the divisions in the national labor movement, AFSCME split in 1937, with the similar-sounding State, County and Municipal Workers of America (SCMWA) forming as its CIO rival. Despite this schism, both organizations embraced similar visions based on government reform programs rooted in the Progressive Era that stressed the expansion of the merit system based on a well-regulated civil service. Both organizations succeeded in organizing a broad range of workers, extending from clerical and technical staff to sanitation workers, police officers, zookeepers, and street repair crews. By 1946, AFSCME claimed a membership of 78,164 to the SCMWA's 70,000.

Historians have noted that the primary difference between the rival state, county, and municipal unions stemmed from political divisions. Led by New York City social worker Abram Flaxer, SCMWA's political program was left-leaning, compared to AFSCME's more liberal politics. In 1947, SCMWA merged with



Students and teachers picket City Hall in New York City on September 16, 1968. A divisive teachers' strike closed the city's public schools for weeks. *(AP Wide World Photos)*

the CIO's organization of federal workers, the American Federation of Government Employees (AFGE), to form the 100,000-member United Public Workers of America. Openly critical of the United States' Cold War policy, the left-leaning UPW drew considerable attention from the federal government and suffered losses in membership through the late 1940s. In 1950, the CIO expelled the union, on the basis that they were in sympathy with the Communist Party, leaving AFSCME as the primary national union representing state and municipal employees.

Despite the expansions in public worker unions through the 1930s and 1940s, these organizations were still perceived as peculiar within the ranks of organized labor. Lacking the legal rights of industrial workers, public workers were limited in their dealings with the government employer. Also, with political conditions varying from region to region, public sector unions developed as very decentralized organizations, limiting their presence as strong national bodies. Nonetheless, public sector unions made significant advancements in the 1950s. By far the most important development in public worker organization during this period was the rise of hospital unions. Although numerous hospital unions had existed with varying degrees of success in Hawaii, Michigan, Philadelphia, and San Francisco, hospital workers were still rarely represented by unions. This changed in 1957 when workers at New York City's Montefiore Hospital organized and attained formal recognition

the following year, initiating a national union drive over the coming decade. The establishment of Hospital Workers Union 1199 highlighted a new moment in union organizing in the United States, reaching out to a new working class made up of a majority of women, African-American, Latino, and other groups traditionally overlooked by unionization drives. These successful campaigns would provide the groundwork for the new spirit of public sector unions in the 1960s.

Public worker unions grew by amazing proportions after 1960. Encouraged in part by John F. Kennedy's signing of Executive Order 10988 in 1962, which further strengthened the rights of federal employees, government workers gained new confidence in organizing. Successful unionization drives by teachers, sanitation workers, clerical staffs, hospital workers, and other public workers assumed central importance in the labor conflicts of the era. By 1967, public sector unions accounted for 1.5 million members, up from 900,000 in 1955.

Throughout the period, public workers asserted their rights in new, militant ways. New York City teachers conducted major strikes in 1960 and 1962 in defiance of state law, gaining bargaining rights and wage increases with the United Federation of Teachers. In 1964, Jerry Wurf, leader of New York's District Council 37, took over as AFSCME international president, pledging the union to a policy that embraced direct action tactics, strikes, and formal collective bargaining. Strikes by hospital workers, trash collectors, street repair crews, firefighters, and the epic strike of 200,000 postal workers in 1970 revealed the unique ability of public workers to impact the functions of everyday life, marking a significant shift in labor relations.

African Americans in the Public Sector Union Movement

Observers of the new militancy of public workers in the 1960s pointed to the prominent roles played by African-American workers, as both leaders and rank-and-file activists, and their blending of workplace and community struggles. One of the most dramatic examples of the labor–community coalition building by public workers during this period was the 1968 Memphis sanitation strike. Striking for better wages and safety conditions, black sanitation workers identified their struggle with the broader fight for civil rights across the city and the nation, and gained the support of the city's African-American churches and community organizations. Their strike took on national proportions when civil rights leader Martin Luther King Jr. joined the strikers, embracing their cause as part of the national Poor People's Campaign that he was initiating. While in Memphis, King was assassinated on April 4, 1968, marking a turning point in the national black freedom struggle.

Following King's death and growing national pressure, the sanitation workers won the strike, establishing a new era of workplace relations and community power in Memphis. Using a rhetoric that transcended the workplace and addressed community issues, such as access to health care, police behavior, racial relations, and the position of women, public workers crafted a new organizational approach that transformed labor relations in the United States.

Women in the Movement

The rise of public sector unions in the 1960s and 1970s was in part the result of continuing shifts in the demographics of workplaces across the United States. Increasingly, women made up a larger proportion of the unionized workforce, gaining more power in nationally prominent public sector unions, influencing the policies and programs adopted by their organizations. By 1978, 49 percent of the American Federation of Government Employees were women, with women also making up 60 percent of the American Federation of Teachers (AFT) and the National Education Association (NEA). Through their presence as leaders and rank-and-file activists, women asserted new roles within their unions. In the 1970s, the national Coalition of Labor Union Women (CLUW) was formed with support from women in public sector unions, providing an institutional base that has continued to shape official union policies at both the local and national levels. Maxine Jenkins (AFSCME Local 101), Sandra Feldman (AFT), and Mary Moultrie (Hospital Workers Union 1199) have been central national leaders who shaped the successes of their national unions. Since this time, public sector unions have taken the lead in placing women's health issues, job training, and pay equity as central tenets of public sector unionism.

The growing power of public employee unions through the 1960s and 1970s led to unprecedented political power and influence at all levels of government. Both the NEA and AFT have been influential in shaping national education policy within Democratic administrations, leading to repeated attacks against these groups as "special interests" in presidential campaigns through the 1980s and 1990s. Increasingly,

public sector unions came under attack for their power in effecting local and national policies. The most aggressive act against public workers came in 1981 when President Ronald Reagan summarily fired all members of the striking air traffic controllers in the Professional Air Traffic Controllers Organization (PATCO), an act that has come to be seen as the opening volley in a period of vigorous anti-union campaigns in both public and private sectors. The political realignment that followed into the 1990s has placed the job security and expansion of government workers and their unions at the center of political debates. Since the 1980s, public workers unions have organized against managerial initiatives that stress increased privatization, a primary concern of all public employee unions.

Present and Future Prospects

At the start of the twenty-first century, public workers and their unions no longer remain peculiar members of the labor movement but have become part of the mainstream, influencing the policies of the AFL-CIO at the highest levels. Public sector union membership, totaling more than 3 million members, far exceeds membership in industrial and manufacturing industries. In 1995, a coalition led by public sector unions succeeded in electing Service Employees International Union leader John Sweeney to the presidency of the AFL-CIO. Sweeney's platform, committed to giving a "New Voice" to labor in the United States, embraces the community spirit and militant tactics that have marked the public workers movement since the 1960s. Seeking to build coalitions with community organizations and academics, and dedicated to the empowerment of women and the organization of non-English speakers through aggressive organizing campaigns, the policies of the AFL-CIO will likely continue to be shaped by the legacy of the public workers movement for many years to come.

Labor Movement and the Vietnam War

The Vietnam War divided the American people in ways not seen since the Civil War. Indeed, in the words of historian George Herring, it was "America's Longest War" and it is the only war that the United States has ever lost. American involvement in Vietnam can be traced from the end of World War II in 1945 to 1975 and beyond, with the actual "hot war" dating from the Gulf of Tonkin Resolution in 1964 to the total withdrawal of American troops in 1973. It was a war that cost over 58,000 American lives and countless casualties. Adding to the controversy of America's involvement is the fact that war was never actually declared by Congress. It was part of the ongoing war on Communism known as the Cold War. The Vietnam War created bitter divisions in American society that have yet to heal. Nowhere were these rifts more evident than in the American labor movement where the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) came into conflict with some of its affiliates, the largest being the United Auto Workers, and with the leadership and rank and file of many union locals across the nation.

Organized Labor's Support for the War

The actions of AFL-CIO president George Meany and his International Executive Board created, in the American mind, the impression of a labor movement solidly supportive of U.S. actions in Vietnam. The reality, however, is that workers and their unions were no more supportive of American actions in Vietnam than the general population. Some survey research concluded that support for the war tended to increase with an individual's educational attainments. Thus, those with a high school diploma or less actually tended to be more dovish on the war. Labor's response to the war was much more complicated and nuanced than many have contended; working people held multiple, diverse, and often divergent views on the war, and these views changed over time.

In 1965, following the commencement of "Rolling Thunder" (the U.S. bombing campaign on North Vietnam), the AFL-CIO Executive Board pledged its "unstinting support" of the Johnson administration's actions. Throughout the ensuing years, the federation's official announcements grew more strident as the public's support for the war dwindled, particularly after the 1968 Tet Offensive. By 1969, the majority of the country, including its working people, had concluded that the war was a mistake. After the election in 1968 of Republican Richard Nixon, Meany and the AFL-CIO continued its support for administration actions in Vietnam. When Nixon chose to expand the war and invade Cambodia in 1970, a wave of disbelief and revulsion spread across the country. Yet Meany congratulated the president, lauding him for his "courage and conviction," while reiterating the federation's support.

Nixon's actions in Cambodia led directly to a resurgence of what had been a relatively quiescent antiwar movement. One demonstration, at Kent State University in Ohio, culminated in the deaths of four students at the hands of National Guardsmen. In New York, as demonstrators prepared to march in reaction both to Nixon's escalation of the war and to Kent State, they were set upon and beaten by a group of construction workers, the so-called hardhats. A few days later, about 100,000 hardhats marched in Manhattan in support of the Nixon administration. But these events have largely been misinterpreted. They were not, for the most part, a manifestation of prowar sentiment. On the contrary, they were the actions of a group of overwrought individuals who saw antiwar protesters as people of privilege who could afford to demonstrate rather than work and who were able to avoid military service because of their class status. In addition, most of the construction workers were paid their day's wages by their employers, contingent on their participation in the march. By 1970, most Americans believed that the country's most

pressing problem was not the war but protest and national unrest.

Although many believed that Nixon had broken his 1968 campaign promise to end the war in short order, Meany and the AFL-CIO felt that Nixon was trying to achieve "peace with honor." They could not countenance the idea that their powerful nation could actually lose a war to the international Communist movement. Thus, as young men, many of them workers, died in the jungles of Vietnam, the federation continued its support until direct U.S. involvement finally ended in 1973.

Meany and the AFL-CIO leadership did represent the sympathies of some in the rank and file, at least in the early years of the war. As time went on, however, and the war fell out of favor with the American people, it did so with workers as well. Meany refused to recognize or reflect the changing sympathies of those he was supposed to represent. In 1974, after the end of direct American involvement, he finally admitted that he had been mistaken in his support for both the Johnson and Nixon administrations on the war.

The UAW Opposes Escalation of the War

Meany and the AFL-CIO were not representative of all union workers or even all national union leadership. The actions of the United Automobile Workers, represented by Walter Reuther and his International Executive Board (IEB), followed a decidedly different path. In 1965, Reuther and the IEB reacted to President Johnson's escalation of the war with some ambivalence. The UAW's IEB did not immediately embrace the Johnson administration's actions. Secretary-Treasurer Emil Mazey was only the first to express his reservations. Reuther himself urged a more moderate resolution on the war than the AFL-CIO's. He decried further escalation, insisting on negotiations and suggesting that the United Nations step in, but he later revised his resolution to express more support for the administration.

What followed over the years to 1968 was a tug of war within the UAW international that echoed events in the nation more than within the AFL-CIO. The UAW IEB was much more ready to buck its leader. Reuther's own brother, Victor, declared early opposition, as did others on the IEB. Family and friends, and those in the rank and file who were not ready to go along with Johnson on the war, had a profound influence on Reuther. But his struggles were not as difficult as those of some workers, whose children were being sent off to fight.

Reuther chose to support Johnson, almost until 1968, in order to achieve the civil rights revolution and the Great Society. The UAW and the Democratic Party were linked through mutual self-interest. In the end, however, the war split the Democratic coalition and ultimately cost the Democrats the election. Reuther realized that the war served the interests of neither the nation nor his rank and file, but he was reluctant to join forces with an antiwar movement that seemed to be anti-American and pro-Communist. The UAW did support the 1969 Moratorium, a national protest against the war. When Nixon invaded Cambodia in early 1970, Reuther reacted publicly and vocally in horror and disgust. His death in a plane crash shortly thereafter did not affect the UAW International's opposition to the war.

Under the leadership of Leonard Woodcock, the UAW continued its opposition to the Nixon administration's conduct of the war. It promoted a 1970 Detroit referendum against the war, supported George McGovern against Nixon in the 1972 election, and helped organize Labor for Peace.

The Working Class and the War

At the local union level, opposition to the war appeared early, though rarely garnering a large and vocal contingent. Individual unions charted their own courses on nonunion issues, not always adhering to the positions taken by the international organizations. During the early days of the war, opposition tended to be subdued where it existed and varied among different trades. But it was at the local level that people paid the price for America's Vietnam misadventure and so were more apt to react adversely to the war.

Left-leaning unions such as Dearborn, Michigan's, UAW Local 600 (at that time the nation's largest local union), the United Electrical Workers (UE), and the International Longshoremen's and Warehousemen's Union (ILWU) were among the earliest to protest the war. In 1967, the Labor Leadership Assembly for Peace, which had been formed in 1966 as the Trade Union division of SANE (the Committee for a Sane Nuclear Policy), drew 523 labor leaders from around the country to Chicago. Both Emil Mazey and Victor Reuther spoke at the assembly. This group considered the war to be immoral, in direct contradiction to George Meany and the AFL-CIO.

Another development that made dissent more palatable to the rank and file was the formation of the Vietnam Veterans Against the War (VVAW) in 1967.

The VVAW operated from the bottom up, for as close to 50 percent of the VVAW was drawn from working-class families, while only 30 percent came from professional or managerial families. According to the VVAW, "We believe that true support for our buddies still in Viet-nam [sic] is to demand that they be brought home . . . before anyone else dies in a war the American people did not vote for and do not want."

It must be noted that the Vietnam conflict was truly, as historian Christian Appy notes, a working-class war. Unlike college students, who held draft deferments throughout most of the Vietnam period, working people were subject to the draft, which often plunged young people directly from the workplace into jungle battlefields. Thus, it was difficult for parents and co-workers to be against the war and still support their "boys" in Vietnam.

Workers did not generally participate in mass antiwar protests. Many working people hated the war and were aware that they were paying its price in dollars and blood. But they also hated the antiwar movement they had come to know primarily through the media. As the movement became more mainstream, especially after 1970, more workers did raise their voices in protest. Thus, the idea of unequivocal labor support for the war and the concept of the average worker as antiwar crusader are incorrect. Though support for America's actions in the Vietnam War was strong among some of the elites of the international unions, local unions and the rank and file were more likely to oppose the war while supporting those who fought it.

Black Lung Movement

Three medical doctors, a United States congressman, and thousands of West Virginia coal miners were part of the most successful agitational movement in the soft-coal industry in the second half of the twentieth century. The three physicians were Dr. I.E. Buff, a cardiologist of Charleston, West Virginia; Dr. Donald L. Rasmussen, a pulmonary specialist of Beckley, West Virginia; and Dr. Hawey Wells, a pathologist of Johnstown, Pennsylvania. The United States congressman was Ken Hechler, a Democrat from Huntington, West Virginia. The movement, known as the Black Lung Movement, was a campaign on the part of miners in the states of West Virginia, Kentucky, Pennsylvania, and Ohio, and their allies, to gain workers' compensation laws that would provide benefits for miners disabled with the disease.

Beginning early in 1968, the Black Lung Movement grew until, at its peak in the spring of 1969, over 40,000 miners were actively involved in the struggle. With the passage of workers' compensation legislation in West Virginia in March 1969, the movement shifted the focus of its efforts to Washington, D.C., where the Federal Coal Mine Health and Safety Act of 1969 was passed by Congress and signed into law by President Richard Nixon in December of that year. In little more than eighteen months, coal miners created the most significant and successful agitational effort the bituminous coal industry had ever seen.

Recognition of Black Lung

Coal workers pneumoconiosis, or "black lung," is the result of inhaling microscopic particles of coal dust during the process of mining coal. Over time, and after considerable exposure to this dust, the lungs cease to be able to transfer oxygen to the blood supply. As the lungs' ability to transfer air fails, the heart becomes enlarged, and massive heart failure produces death. In intermediate steps, the miner is often short of breath and unable to function effectively.

Black lung became an issue in coal mining after World War II as mines made greater use of mechanical equipment that created greater amounts of dust. By the early 1960s, the disease was recognized in Europe as a significant health problem and had received some attention in America.

The early efforts of Dr. I.E. Buff, in 1968, to direct attention to the problem of black lung were largely unsuccessful. The government of West Virginia, the United Mine Workers of America (UMW), and the medical profession all failed to take any action to deal with the disease and its effects. The federal government, under President Lyndon Johnson, had proposed a comprehensive coal mine health and safety act late in 1968, but that proposed legislation did not include references to black lung. All of this changed dramatically in November of that year when a major explosion shook Consol Number 9, a large mine that lay between the communities of Farmington and Mannington, West Virginia.

The explosion trapped some seventy-eight miners underground. After nine days of futile rescue attempts, the mine was sealed. The tragedy of Consol Number 9 received worldwide media attention. Families across America, sitting down to their Thanksgiving dinners, could watch newscasts of the unending vigil of the miners' families waiting for news. Coal mine safety became an overnight issue of importance. Buff took advantage of that attention to attend a series of meetings held throughout West Virginia and eastern Kentucky, trumpeting his message of the dangers of black lung. His two colleagues, Donald Rasmussen and Hawey Wells, joined him in this effort. They styled themselves the Physicians for Miners Health and Safety Committee and held audiences spellbound as they discussed the problems of coal workers pneumoconiosis.

Philip Trupp, in his *Washingtonian* article, described how Buff would bark out phrases like "Black Lung is what's killing all of you. But the company says you're sick in the head, shiftless, or stupid. The

company says you've got compensationitis. You're dying, and the killing will go on . . ." Rasmussen, a redhead with a beard, gave his miner audiences an accurate picture of the nature of the disease itself. Brit Hume, in *Death and the Mines* (1971), described the third member of this "traveling medicine show," Dr. Wells, as a pathologist, who would give speeches "laced with rabble-rousing rhetoric and calls for political action." Wells used a particularly flamboyant device. He would take dried sections from diseased lungs and crumple them to dust, exhorting his audience to action.

Rise of the Black Lung Movement

Considerable attention was brought to the miners' cause at the first Charleston, West Virginia, mass meeting held in late January 1969. Over 3,000 miners from around the state participated in the ninety-minute meeting that included speeches by the three doctors, Congressman Hechler, other state politicians, and a number of miners. Ben Franklin, writing in the *New York Times*, called the miners "strangers to protest," yet they "demonstrated here today that they could be organized to make unexpectedly militant demands upon their union and their government."

Miners who attended this and other meetings held throughout West Virginia in January of 1969 became disgusted with the inaction of the UMW and formed their own lobbying organization, the Black Lung Association. The BLA hired a former member of the West Virginia State Senate, Paul Kaufman, to serve as its chief lobbyist. Attention then moved to the West Virginia legislature, where a number of bills dealing with black lung were introduced, some by the UMW and others by the Black Lung Association.

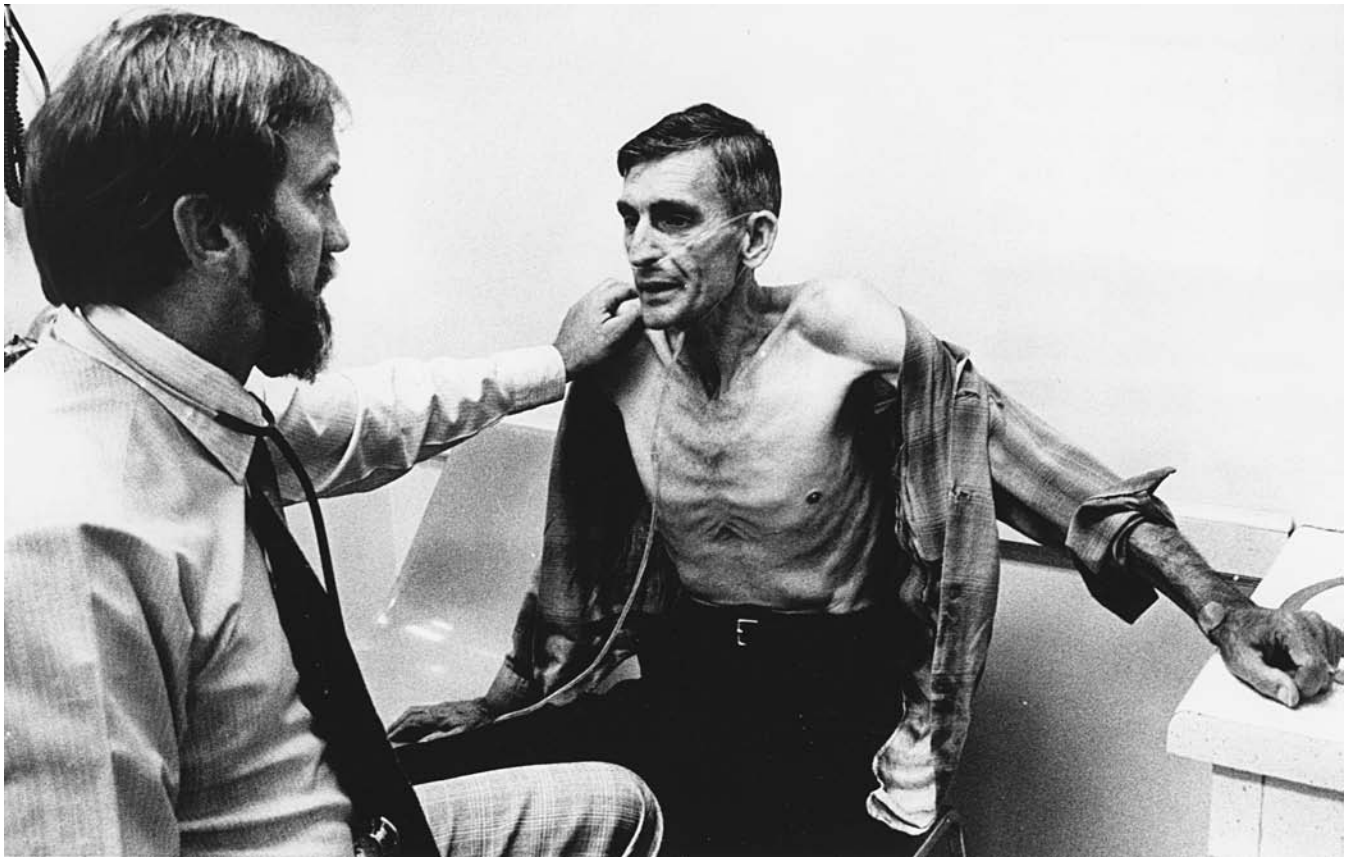
Throughout the early days of the legislative session, coal miners were in attendance, wearing armbands and buttons with the numbers "78/4" referring to recent deaths in mines. On several occasions, they brought a large coffin to the rotunda of the capitol building and held mock funerals for their comrades. The major legislative event was a lengthy joint hearing before the Judiciary Committees of the West Virginia Senate and House of Delegates on February 11, 1969. The hearing brought out the various positions of the proponents and opponents. The major point made by the proponents was that black lung was a distinct and identifiable disease, and not silicosis, and that the disease was not easily diagnosed, particularly not by X rays. The opponents argued that the concept of presumption—assuming that a miner who had spent significant years in mines had the disease as a matter of course—was a dangerous legal concept. They further argued that X-ray evidence was a vital part of diagnosis. Left out of the medical testimony was the earlier claim of the West Virginia medical profession that the ailment was the result of the excessive smoking done by miners when they were off work.

As the West Virginia legislature entered the final weeks of its two-month session, the lobbying efforts of the miners intensified. Many of the lobbyists were disabled miners or widows of coal miners, some of whom belonged to the Association of Disabled Miners and Widows. Many of them had never been to Charleston or the state capitol before. Although the professional lobbyists scoffed at this "grassroots" effort, their presence had an effect.

Rank-and-File Workers, the Union, and the Industry Counteroffensive

There were two essential facts in favor of the coal industry when it came to responding to the Black Lung Movement. The first was the strong tie between the operators and the UMW. If they were both in agreement on a bill, it was highly likely to gain passage into law. The second was the historic and traditional influence of the coal operators with the leadership of the West Virginia legislature. The central attack on the legislation proposed in West Virginia focused on the burden that additional compensation benefits would place on the coal industry. Provisions in federal bills that required coal mines to maintain certain levels of dust in order to reduce the prevalence of the disease aroused concern in the industry.

One of the primary conflicts of the Black Lung Movement was between the leadership of the UMW and the rank-and-file members of the union. The UMW had often proclaimed its interest in fighting for new health and safety legislation but evaded any real action by claiming that current laws were satisfactory. The UMW leadership was caught in a bind: they had strongly proclaimed their intention to fight for compensation laws, yet they didn't want to press for laws that would alienate the coal operators and disturb their long alliance. But the leaders were faced with a growing discontent and activism on the part of their rank-and-file members in a year that was to see the election of top union offices. The union's first response was to discredit both the doctors and Congressman Hechler by asserting that they were just agitators, out to incite trouble. The most significant



In a government-run black lung clinic in Prestonburg, Kentucky, Dr. Ballard Wright examines Oliver Moore, a miner in need of an operation in 1983. The Black Lung Movement persuaded the federal government to enact health and safety measures on behalf of miners. *(AP Wide World Photos)*

union effort to suppress the movement came after the January Charleston rally when several UMW districts ordered their members to support UMW bills and not the one introduced by the Black Lung Association. The implication of this demand was clear: any UMW member who supported or joined an organization that was deemed a "dual organization" was subject to suspension or expulsion from the UMW, losing medical benefits. This threat, though a serious one, had little effect on the movement.

The climax of the struggle came near the end of the session of the West Virginia legislature. By agreement of the legislative leadership, the House of Delegates was given initial responsibility for developing black lung legislation. When the House had passed a bill, the Senate would act. Miners had been promised that a bill would be reported to the floor of the House a week after the February 11 hearing.

When the House Judiciary Committee seemed stalled, and no bill appeared, the miners escalated the struggle. On Tuesday morning of February 18, some 282 men at the East Gulf Mine of the Winding Gulf Coal Co. refused to enter the mine. The miners indicated that they felt that they had to support Dr. Buff and the struggle for legislation. By the following morning, the strike had spread to nine mines in both Raleigh and Wyoming counties. By Thursday, reports had over 4,000 miners idled; by Friday the estimated number was 7,000 throughout the southern West Virginia coal fields. The wildcat strike took leaders of the Black Lung Association by surprise, and the miners were urged to return to work, as a strike was not seen as a solution to getting good legislation. Dr. Buff and his colleagues, however, saw the strike as a spontaneous response from the miners and urged them to continue. Once again national media attention was focused on coal miners, this time in Charleston and in the halls of the West Virginia capitol. By Wednesday, February 26, it was reported that some 30,000 miners had closed the mines in the southern part of the state, and that more than 50 percent of the northern ones were shut as well. The UMW response was to take

out full-page advertisements urging their members to return to work, as the strike was not lawful under their contract.

It was too late. The afternoon of that same day the second giant rally was held in Charleston. Many of the same speakers were heard again—Drs. Buff, Rasmussen, and Wells, and Congressman Hechler. Miners from many parts of the state spoke, expressing solidarity with their brothers. At the end of the meeting, the 2,000 assembled miners poured from the Civic Center and began their march to the capitol, a mile and a half away. They marched down Kanawha Boulevard, a wide, divided four-lane road that runs along the Kanawha River almost the length of the city of Charleston, which lies in the narrow river valley.

As they approached the capitol, they were some fifty abreast, and they turned and marched up the flight of stairs to the central doors of the gold-domed capitol building. Inside, on the third floor, overlooking the stairs, were the members of the House Judiciary Committee in session. They looked out on a sight that none of them had ever seen before—hundreds of coal miners marching up the steps and into the building.

The coal industry tried to bring an end to the strike and sought a court injunction, which was denied. The UMW held meetings at union locals urging members to return to work. That effort failed. By Monday, March 8, the striking miners numbered over 40,000 and had closed down the coal industry in West Virginia, then the nation's largest coal-producing state. When the walkout first began, a UMW official was reported in *The New Republic* to have said: "Don't worry about it. The boys just got a little excited. They'll be back to work tomorrow or the next day." The striking miners stayed out for over three weeks, not returning until after Governor Arch Moore signed into law the black lung bill on Tuesday, March 11. Passage of federal legislation that included support for a federal compensation program followed later in the year, with President Nixon signing the Federal Coal Mine Health and Safety Act of 1969 into law on December 30.

The Black Lung Movement, born in 1968, nurtured by an evangelistic West Virginia physician, rallied by a maverick congressman, joined and supported by over 40,000 striking coal miners, had achieved its goal. America's disabled coal miners—slowly dying from an almost unpronounceable disease—at last had hopes of living out their lives with a measure of dignity.

LABOR MOVEMENT 1981–PRESENT

The labor movement in the United States faced enormous challenges in the 1980s and 1990s. A conservative political shift, an employer offensive against unions, and economic restructuring devastated the ranks of American trade unions. Between 1983 and 2001, the percentage of workers in the United States who belonged to unions declined from 20.1 percent to 13.5 percent. The decline of unions had a negative effect on the lives of the American working class. As unions shrank, workers became poorer and faced greater insecurity. In the 1970s and 1980s, workers' income dropped 13 percent, and between 1978 and 1999 average employer compensation for workers decreased by 8.6 percent.

During the same time workers' productivity increased. The labor movement responded in various ways to the crisis that it faced in the last two decades of the twentieth century. In the 1980s, rank-and-file unionists challenged the cautious leadership of the country's largest labor federation, the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) and organized militant campaigns against plant closings and concessions. In the 1990s, a new group of leaders came to power in the AFL-CIO who energized an increasingly militant working class. Despite continued decline in membership, the labor movement sought to return to its roots as a social movement. It committed more resources to organizing, made broader alliances with religious, civil rights, and other community groups, and gradually embraced more militant tactics to improve the lives of all workers.

EMPLOYER OFFENSIVE AND CONSERVATIVE BACKLASH

In the 1980s, the labor movement had to confront declining influence in American society. Between 1980 and 1986, trade union membership dropped from 24 million to approximately 17 million. The percentage of unionized workers also declined, from 27 percent in the early 1970s to just 18 percent by 1986. The country's largest and most powerful industrial unions lost hundreds of thousands of members. The United Auto Workers (UAW) lost close to 500,000 members between 1979 and 1985. Its total membership shrank from 1,499,000 in 1979 to just over 1 million. In the same period, United Steelworkers of America's membership declined from 964,000 to 572,000. Other major unions like the United Rubber Workers, the International Association of Machinists, and the International Union of Electrical Workers lost tens of thousands of dues-paying members in the early 1980s.

A variety of economic and political forces led to the decline of organized labor. Deindustrialization had a significant impact on the fate of American unions. In the 1980s, the United States lost millions of jobs in the heavily unionized manufacturing sector of the economy. Between 1980 and 1985, the country lost 2.3 million manufacturing jobs. Automation and a severe economic recession in the early 1980s that led to plant closings and layoffs fueled deindustrialization. But the loss of manufacturing jobs resulted largely from corporations' decision to relocate their production facilities to low-wage regions in the Third World. Manufacturers that remained in the United States often relocated their plants to the lower wage and less unionized South. Plant relocations to the Southern states contributed to the decline of manufacturing jobs in the Midwest and Northeast.

Many of the workers "dislocated" by deindustrialization were unemployed for long periods of time or did not find new jobs. Unemployment remained high through the late 1980s, particularly for African-American and Latino workers. The laid-off workers who found employment primarily entered the service sector, where most of the country's job growth occurred. These new service jobs were largely nonunion,

part-time, and low-wage. On average, factory workers who had been laid off between 1979 and 1983 and found jobs by 1984 saw their earnings drop by 16 percent.

Unions had to confront an increasingly hostile political climate in the 1980s. In 1981, the newly elected president, Ronald Reagan, began to undermine the power of the labor movement. In August 1981, Reagan sanctioned an aggressive stance against labor when he fired and permanently replaced the striking members of the Professional Air Traffic Controllers Organization (PATCO). Reagan weakened federal agencies set up to protect workers' rights, like the Occupational Safety and Health Administration and the National Labor Relations Board (NLRB). The NLRB became increasingly pro-business and less responsive to union grievances under the tenure of the Reagan-appointed chair of the NLRB, Donald Dotson. The NLRB gave employers the right to exclude plant closings as a collective bargaining issue and more power to fire union members. The percentage of pro-business rulings that the Dotson NLRB issued increased significantly compared to earlier boards, favoring unions in only 55 percent of its unfair labor practices cases and 25 percent in cases involving union-organizing drives.

The conservative political shift bolstered a broad employer offensive to keep unions out of their workplaces. Employers hired labor consultants and attorneys, known as union-busters, to lead campaigns to decertify unions and defeat organizing drives. By the early 1990s, union busting had become a billion-dollar industry employing thousands of consultants. Employers and their consultants used a variety of tactics, often in violation of labor law, to create union-free workplaces. To eliminate existing unions, employers, who are banned from initiating a decertification drive, persuaded pro-company workers to file for decertification or during strikes hired replacement workers who would vote out the union. To defeat organizing drives, employers, ignoring labor law, used threats and intimidation.

During the 1980s, employers often threatened to cut jobs in response to a pro-union vote, fired thousands of union organizers, and spread many more negative rumors about key union activists to undermine their credibility. The pro-business stance, slowness, and low fines of the NLRB emboldened anti-union employers who acted illegally to keep unions out. Employers adopted tactics that less blatantly violated labor law, such as holding captive-audience meetings where employees had to listen to speeches opposing the union and watch anti-union films or slide shows.

Unions faced an increasingly difficult bargaining climate during the 1980s. Employers successfully forced unions to make numerous concessions during negotiations. Since World War II, unions had regularly negotiated three- to five-year contracts that provided their members with wage increases and improvements in their benefits. Often, these contracts were negotiated on an industrywide basis. In the 1970s, employers in various industries such as meatpacking and rubber had forced unions to take cuts in wages and benefits. But concessionary bargaining gained momentum in 1979, when politicians and bankers demanded concessions from the UAW in exchange for massive bailout loans to a financially troubled Chrysler.

The UAW acquiesced and between 1979 and 1981 took wage and benefit cuts worth over $1 billion. To prevent a competitive advantage for Chrysler, soon the other big two automakers, Ford and General Motors (GM), demanded concessions. Concessionary bargaining gripped industry and continued even after the recession of the early 1980s ended and among profitable firms. Union workers in steel, meatpacking, transportation, communications, and many other industries faced wage cuts, reduced benefits, and loss of control over work rules.

The Labor Movement Responds to the Crisis

The labor movement was divided over how to respond to the employer offensive and the conservative political shift. The leadership of labor's umbrella organization, the AFL-CIO, responded cautiously. The AFL-CIO executive board during the 1980s, led by Lane Kirkland, was hostile to grassroots challenges to employers and sought to empower labor through established channels. The AFL-CIO spent much of its energy in the decade building support for the Democratic Party, largely through large financial contributions and electoral mobilizations. The Democratic Party, however, had become increasingly pro-business and offered less to workers in return for their political support.

Business unionists also advocated top-down control of union affairs and a nonadversarial approach with employers. They pressured their members to accept concessions and supported a growing number of labor–management cooperation schemes. In 1980, for example, UAW president Doug Fraser accepted a seat

on Chrysler's Board of Directors in exchange for accepting wage and benefit cuts. The team concept that emphasized cooperation between unions and management became increasingly popular. Unionists joined programs such as Quality of Work Life (QWL) where they exchanged ideas with supervisors about how to improve conditions in the plants. Many workers complained that instead of empowering workers, management used employees' ideas to streamline production and eliminate jobs. The AFL-CIO's leadership also offered very little response to declining union membership, committing only a small percentage of its resources to new organizing.

A segment of organized labor advocated militant challenges to attacks on unions. In some unions, rank-and-file dissidents organized reform movements against the business union agenda. One of the most successful reform movements in organized labor emerged among members of the International Brotherhood of Teamsters. In the late 1970s, rank-and-file Teamsters, primarily Socialists affiliated with the International Socialists, organized the Teamsters for a Democratic Union (TDU). In the late 1970s and early 1980s, TDU organized to make the highly centralized and notoriously corrupt Teamsters more democratic and willing to challenge employers. The TDU defeated a 1983 contract proposal that included major concessions to the freight industry, supported other striking workers fighting concessions, won internal reforms like the right to directly elect national officers, and took control of the executive board in the 1991 elections.

The UAW's shift toward concessionary bargaining triggered a reform movement called New Directions among unionized autoworkers. In the face of opposition from the UAW's ruling Administrative Caucus, New Directions candidates won important union offices, and through work slowdowns and strikes challenged concessions like faster production lines.

Union workers led dramatic strikes during the 1980s to defeat concessions. In 1985, members of P-9 of the United Food and Commercial Workers union, in opposition to their international leaders, went on strike against wage cuts, deteriorating safety conditions, and other concession demands by the Hormel meatpacking company at its Austin, Minnesota, plant. A broad community campaign emerged involving numerous labor, civic, religious, and political organizations that lent their support to the striking meatpackers. Strikers and their supporters organized rallies, parades, pickets, blockades at the plant gates, sit-ins at Hormel headquarters, and many other nonviolent direct action tactics to pressure the profitable company to provide decent wages and working conditions.

The Austin workers also hired the pro-union Corporate Campaign Inc., led by Ray Rogers, to launch a "corporate campaign" that involved a media campaign and mobilizing pressure on First Bank System, which financially backed Hormel. Corporate campaigns, developed initially by Rogers in the late 1970s, became a widely used tactic by striking workers in the 1980s. The strike ended in 1986 when the UFCW's international leaders, who had ordered an end to the strike, with the backing of the courts placed P-9 in a trusteeship and agreed to Hormel's concessions. Court injunctions against P-9 actions, arrests of union leaders, and National Guard troops that protected replacement workers had also weakened the strike.

Hormel workers in Austin were not the only unionists to strike against concessions in the 1980s. Although the number of strikes declined in the 1980s from 187 in 1980 to 54 in 1985, workers in steel, communication, paper mills, food processing, transportation, and other industries led important work stoppages to reverse declining wages and working conditions. Most faced the same fate as P-9 in Austin. In 1983, the United Steelworkers and twelve other unions representing workers at Phelps Dodge's copper mines in Arizona and Texas led a year-long strike when the company sought to withdraw from an industry pattern agreement and concessions.

Strikebreakers and a successful company-backed decertification campaign broke the Phelps Dodge strike. Three years later, 22,000 steelworkers struck USX Corporation but were defeated after agreeing to a contract that cut wages, holidays, vacations, and other benefits. An eleven-month strike by 1,700 members of the United Mine Workers in 1989 at the Pittston Coal Company proved more successful. Unlike P-9, Pittson workers had the support of their international, led by the reform-minded Richard Trumka. Through community coalitions, a corporate campaign, and civil disobedience, including blocking coal trucks and occupying a mine, Pittston workers successfully fought the company's demand for concession and its attempt to withdraw from the industrywide contract pattern.

Plant closings did not go unchallenged by America's unionists during the 1980s. Most business unionists rarely opposed plant shutdowns, accepting them as a corporate prerogative. They also tended to share employers' commonly used argument that foreign

competition (particularly from Japan) in industries such as steel, automobiles, and electronics led to plant closings. Labor leaders joined with big business in Buy American campaigns and lobbying for higher tariffs on foreign imports.

The focus on foreign competition often tapped into the racial prejudices of white workers and led many Americans to scapegoat Asians and Asian Americans for their plight. In at least one case in June 1982, a twenty-seven-year-old Chinese-American man named Vincent Chin was killed by two white autoworkers in Detroit during a dispute at a bar. Prior to murdering Chin with a baseball bat, auto plant foreman Ronald Ebens and his accomplice, laid-off autoworker Michael Nitz, misidentified Chin as Japanese, calling him a "Jap" and telling him that he had cost them their jobs. Ebens and Nitz escaped jail time and were sentenced to probation. But the Chin murder and the light sentences Ebens and Nitz received helped trigger the contemporary Asian-American equal rights movement.

Some workers offered more complex explanations for the plant closings and presented militant challenges. A number of unionists charged that plant closings were more likely the result of corporate mismanagement and greed than of foreign competition or, as many employers maintained, of high union wages and government regulation. In numerous cases, plant-closing activists found that companies had refused to modernize profitable plants, "milked" profits from one plant to pay for other investments, set artificially high prices, and sought to move plants to achieve greater flexibility and profits in nonunion environments. Workers and community activists in western Pennsylvania and eastern Ohio organized to prevent the shutdown of steel factories in Youngstown, Ohio. In the late 1970s through the 1980s, activists organized the Ecumenical Coalition of the Mahoning Valley in Youngstown and the TriState Conference on Steel in Pittsburgh to prevent shutdowns. Activists held pickets and demonstrations, occupied U.S. Steel headquarters, and filed lawsuits to prevent plant closings. They also advocated worker or worker-community ownership schemes through community and government financing.

Organized labor also sought to respond to declining union membership. Unionists, however, were divided about how to increase their numbers. Some unionists emphasized militant organizing campaigns among workers in nonunion workplaces, including the growing number of workers employed in the service sector. The Service Employees International Union (SEIU) launched campaigns to organize healthcare workers employed by nursing homes. In the mid-1980s, SEIU organized Justice for Janitors, which led successful campaigns to organize mostly African-American, Latino, and immigrant custodial workers who cleaned office buildings in America's major cities.

But most AFL-CIO unions advocated a more cautious approach, accelerating the trend toward union mergers. Larger unions often absorbed smaller unions that represented workers from different industries, like the Insurance Workers with the United Food and Commercial Workers or the Amalgamated Meat Cutters and the Retail Clerks International Union, which merged in 1979. As many as 2,100 unions merged between 1979 and 1984, consolidating labor's shift away from craft or industrial jurisdictions toward general unionism. Some unionists argued that mergers strengthened unions, particularly the smaller, less powerful locals that might otherwise not survive. Critics charged that smaller unions lost influence in mergers and that mergers led to less internal democracy as unions expanded their bureaucracy to deal with a more diversified membership.

Lean Production and New Challenges to the Labor Movement

In the 1990s, the AFL-CIO adopted an increasingly militant stance that led many observers to pronounce a resurgence of organized labor. The militant shift was connected partly to the victory of the New Voice slate over Thomas Donahue's slate in the 1995 AFL-CIO elections. New Voice was led by its presidential candidate, SEIU head John Sweeney, candidate for secretary-treasurer, UMWA president Richard Trumka, and vice presidential candidate, Linda Chavez-Thompson, vice president of the American Federation of State, County, and Municipal Employees (AFSCME).

New Voice insurgents charged that, under the leadership of Lane Kirkland, the labor movement had become too bureaucratic, cautious, and willing to compromise with management. In an effort to thwart New Voice, Kirkland, who had been AFL-CIO president since 1979, stepped down in 1995 in favor of the secretary-treasurer, Thomas Donahue. The New Voice platform called for a greater emphasis on new organizing and labor solidarity and increased political activism and alliances with progressive organizations and social movements. It also advocated stronger ties with the growing number of women and people

SUMMARY OF THE GREENGROCER CODE OF CONDUCT 2000

The Greengrocer Code of Conduct was New York State Attorney General Eliot Spitzer's effort to enforce national wage and hour laws ignored by a growing number of employers in recent years. In 2000, workers in delis and groceries in New York typically paid new immigrants well below minimum wage, with no overtime, for seventy-two hours a week.

1. Min. Wage & Overtime
   - Pay all employees at least minimum wage, now $5.15 per hour.
   - Pay all employees "overtime"—1½ an employee's regular hourly rate for all hours worked past forty per week.
2. Timely Pay
   - Pay employees in a timely manner.
3. Records & Pay Stubs
   - Keep all payroll & time records required by state and federal law.
   - Give each employee a weekly pay stub of hours and wages (gross & net).
4. Rest
   - Give each employee one full unpaid day of rest per week.
   - Give each employee at least ½ hour uninterrupted for meal break and others as required by law.
5. Rights Poster
   - Post this Code on a wall in an easy-to-see location.
   - Post a notice on a wall about basic wage and hour rights.
   - The Code and notice will be in at least English, Spanish, and Korean.
6. Days off
   - For employees who have worked at the store for at least one year: provide 2 paid sick days and one workweek of paid vacation days per year.
   - For employees who have worked at the store for at least two years: provide 3 paid sick days and one workweek of paid vacation days per year.
7. Seminars
   - Attend at least one labor law seminar by Attorney General's Office.
8. Not Retaliate
   - The Code employer will not discharge or retaliate against any employee for making a complaint to the employer, the government, or the Monitor about violations of the Labor Law or this Code.
9. Organizing
   - The Code employer recognizes employees have legal right to organize and to join labor unions of their own choosing, and that the law prohibits retaliation against employees for organizing or joining a labor union.
10. Monitoring
    - The Code employer agrees to submit to unannounced monitoring of compliance with the Code at least two to three times per year.
    - When monitoring occurs, the Code employer will show all payroll and time records, and make employees available for private, confidential interviews.
11. Consumers
    - A Code of Conduct Seal will be displayed in the store window as long as the Code Employer is in good standing.
    - A list of Code members in good standing is available at the New York State Attorney General's website: www.oag.state.ny.us.
    - Code members no longer in good standing must post a notice stating as such, and will also be listed on the website.
12. Hotline
    - Call 1-800-729-1180 with complaints of violations.

of color in the workforce and in unions. Between 1986 and 1995, the number of white men in unions declined from 55.8 percent to 49.7 percent. In the 1980s and 1990s, the percentage of black, Latino, and Asian Americans in the American workforce increased at a dramatically faster pace than the overall labor force. To connect with these workers, New Voice backed Linda Chavez-Thompson, the first woman of color AFL-CIO executive officer, and after their victory reserved spots for people of color on the AFL-CIO's executive board.

The progressive vision of the AFL-CIO's new leadership benefited from a change in political leadership in Washington, DC. After twelve years of Republican control of the White House, Democrats Bill Clinton and Al Gore were elected president and vice president. Both men symbolically supported labor by appearing with AFL-CIO leaders and publicly defending workers' right to organize unions. The Clinton administration supported some aspects of labor's political agenda. Clinton pushed for an increase in the minimum wage and signed the Family and Medical Leave Act of 1993, which gave workers the right to take twelve weeks of unpaid leave after the birth of a child or to take care of a seriously ill relative. He also signed an International Labor Organization treaty against certain kinds of child labor. He strengthened unions by issuing an executive order that prevented firms with federal contracts worth over $100,000 from permanently replacing striking workers. Clinton also vetoed the Team Act, which would have allowed employers to form company unions in nonunion workplaces.

The labor movement and the workers it represented, however, continued to face enormous challenges in the 1990s. Clinton and Gore, political centrists, proved inconsistent allies, often supporting pro-business initiatives at the expense of organized

labor and working people. Clinton signed the North American Free Trade Agreement (NAFTA), which opened up markets among Canada, the United States, and Mexico. Although NAFTA advocates argued that the agreement would create jobs in the United States, the effects have been the reverse, and it has undermined union strength. Between the implementation of NAFTA in 1994 and 2002, hundreds of thousands of high-paying manufacturing jobs, many in unionized plants, disappeared as companies shifted their operations to Mexico in search of cheap labor.

American employers increasingly used NAFTA as a tool to undermine union organizing drives, by threatening to relocate their plants if workers decided to unionize. Clinton supported other free-trade initiatives like the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO), which was formed in 1995 to enforce global trade rules, including GATT. The WTO limited the rights of member nations to pass laws that might create barriers to trade and limit the ability of a company to maximize its profits. For example, nations belonging to the WTO can sue other WTO member nations to overturn laws designed to protect labor, environmental, and human rights.

Corporations continued to pursue policies in the 1990s to eliminate unions from their workplaces and to cut labor costs. American firms continued a forty-year trend toward moving their production facilities overseas, favoring Eastern Europe and Southeast Asia, for their low wages and lax environmental and labor regulations. By 2002, many American firms that relocated to Mexico in the 1990s had closed their Mexican plants and shifted once again to Asia in search of even cheaper wages. Companies also developed "lean production" or "Just-in-Time" methods as a way to maximize profits and, in the case of manufacturers, to reduce inventories. Businesses "outsourced" work to nonunion subcontractors.

The Big Three auto manufacturers, GM, Ford, and Chrysler, relied on auto parts firms to supply them with noncore parts that would arrive at their factories as they were needed in the production process. Other employers, like universities and public schools, privatized their custodial services, and the federal government hired a growing number of private nonunion–subcontractors.

A growing number of firms turned toward "downsizing" and part-time temporary labor as a way to boost profits. In January 1994, 108,946 workers lost their jobs as a result of corporate downsizing. General Motors laid off close to 70,000 workers, Sears fired 50,000, and IBM cut 38,500 employees from its payroll. Corporations also began to hire more temporary workers, who often received lower wages and lacked benefits like healthcare, unemployment, sickness, disability, or pensions. Although the number of part-time workers is debated, some estimate that between 16 and 18 percent of the entire workforce is contingent. Part-time employment agencies like Manpower became Fortune 500 companies and by 1996 became the second-largest employer in the United States. In 1997, temporary employment agencies placed 2.5 million workers in jobs.

By 2000, capital flight and lean production had increased the gap between the rich and the poor. In the 1990s, the economy grew rapidly and corporate profits soared, while workers earned less, produced more, and worked longer hours. In 1980, on average, CEOs earned 42 times the pay of workers in blue-collar jobs, which increased to 85 times in 1990 and by 2000 531 times. CEOs of major corporations continued to receive high pay, an average of $20 million in 2000, even as corporate profits fell and as a corporate crime wave unfolded at the turn of the millennium. In 2001 and 2002, investigations into corporate abuses revealed that a number of CEOs attained enormous wealth by selling their stock options just prior to public knowledge of poor earnings for their companies. Investigators also showed that, throughout the 1990s, many corporations led by highly paid CEOs had posted artificially high profits by manipulated their accounting, often illegally and in collaboration with accounting and investment firms and banks.

New Voices and Militancy in the Labor Movement

Organizing

The labor movement responded to these challenges more vigorously than it had in decades. The AFL-CIO committed more resources to organizing new workers. The labor body advocated a more expansive approach to organizing, relying less on professional union staff and more on rank-and-file workers and coalitions with community and student groups. The AFL-CIO expanded its Organizing Institute to train people who wanted to become full-time union organizers. In 1996, it established Union Summer to build support for union drives. During Union Summer, students, workers, and community activists participated in a four-week internship helping to organize picket lines, distributing literature, and demonstrating on be-

MODEL LIVING WAGE ACT

Privatization and the growth of low-wage jobs have prompted a growing number of labor organizations to encourage municipalities to sponsor "living wage acts" to mandate that employers pay workers more fairly. The following is an excerpt of a model living wage act by the Center for Policy Alternatives.

SECTION 1. SHORT TITLE

This Act shall be called the "[STATE] Living Wage Act."

SECTION 2. FINDINGS AND PURPOSE

(A) Findings—The legislature finds that:

1. The state of [STATE] awards contracts that result in the employment of thousands of individuals. Many of these individuals, employed indirectly by the state, receive sub-poverty level wages.
2. The creation or promotion of jobs that pay sub-poverty level wages is shortsighted economic and social policy. Such jobs do not lead to a self-sufficient workforce or support sustainable community development. Instead, they increase the need for government services, such as public assistance for food, housing, health care, and child care.
3. The state is not an innocent bystander in the payment of sub-poverty level wages. It is necessary and appropriate for the state to require that contractors working on state business pay at least a living wage.

(B) Purpose—Recognizing that the state is a major contractor for services, this law is enacted to increase the wages of service employees who indirectly work for the state in order to improve public health and welfare, promote the economic strength of our society, and take pressure off state social service programs.

SECTION 3. LIVING WAGE

(A) Definitions—In this section:

1. "Secretary" means the Secretary of the Department of [LABOR], or the Secretary's designee(s).
2. "State" means the state or a principal unit of state government.
3. "State contractor" means a for-profit or not-for-profit entity that has a state contract.
4. "State contract" means: a. A contract for services with the state valued at $100,000 or more; or
   b. A subcontract valued at $25,000 or more for providing part or all of the services covered by another entity's contract for services with the state valued at $100,000 or more.
5. "Basic health insurance benefits" means an insurance plan where an employer pays 100 percent of the premium for individual coverage or 80 percent of the premium for family coverage if the health insurance:
   a. Covers at least 80 percent of the costs of office visits, emergency care, surgery, and prescriptions; and
   b. Has an annual deductible of no more than $1,000.

(B) Payment of Living Wage

1. Any state contract for services must require state contractors to pay an hourly wage rate that is at least the living wage.
2. During the duration of a state contract, a state contractor shall pay to each employee who is working on the state contract an hourly wage rate that is at least the living wage.
3. If a state contract is subject to prevailing wage requirements under [appropriate citation], the state contractor shall pay the living wage or the prevailing wage, whichever is higher.

(C) Calculation of Living Wage

1. The initial living wage shall be $10 per hour without basic health insurance benefits or $8.50 per hour with basic health insurance benefits. . . .

(D) Waivers and Exemptions

1. A not-for-profit entity that is subject to this section may apply to the state agency that is responsible for the state contract for a waiver of the living wage requirement, based on economic hardship. . . .

(E) Enforcement

1. No state contractor shall discharge, demote, harass or otherwise take adverse actions against any individual because such individual seeks to enforce this section, or testifies, assists, or participates in any manner in an investigation, hearing, or other proceeding to enforce this section.
2. No state contractor shall split or subdivide a contract, pay an employee through a third party, or treat an employee as a subcontractor or independent contractor to avoid payment of a living wage. . . .

half of unionizing workers. Between 1996 and 2001, Union Summer had over 2,300 interns. The AFL-CIO more successfully built unions among the growing number of low-wage immigrant workers in the United States.

The SEIU continued to build on the successes of Justice for Janitors. In Los Angeles, in alliance with religious and community groups, Justice for Janitors waged militant campaigns that increased the percentage of unionized custodians in the city from 10 percent to 90 percent between 1987 and 1995. In 1999, in one of the largest union victories in fifty years, 74,000 mostly Latina and African-American women home-healthcare workers gained the representation of SEIU.

A significant movement to unionize graduate students employed as teachers and researchers at American universities gained momentum during the 1990s. Teaching assistants at the University of Wisconsin formed the first graduate student union in 1966, the Teaching Assistants' Association, followed shortly by graduate students at the University of Michigan who formed the Graduate Employee Organization. In the 1990s, public attention turned toward a growing number of successful organizing drives among graduate employees at America's major public and private universities, including the University of Iowa, the University of California, New York University, Temple University, and Wayne State University. Graduate unions affiliated with various international unions, including the UAW, the United Electrical Workers (UE), the American Federation of Teachers (AFT), the Communication Workers of America, and the National Education Association. By 2002, twenty-seven graduate employee unions existed representing 20 percent of the graduate employee workforce, and many graduate employees at other universities were leading union campaigns.

Graduate employees argued that by the 1990s universities functioned increasingly like corporations. They cut costs by turning toward cheap labor, in this case graduate students and part-time adjuncts. At some universities, graduate students taught as much as 40 percent of the undergraduate courses with little compensation. Graduate employee unions demanded and won contracts with higher pay, health benefits, and grievance procedures.

Despite the energy and dynamism of the new organizing, union membership continued to decline due to job loss, the growth of nonunion service sector jobs, and continued corporate attacks on union rights. Between 1990 and 2001, the percentage of union workers dropped from just over 15 percent to 13.5 percent, or 16.3 million workers. Government workers, particularly teachers, firefighters, and police, remained the most highly unionized segment of the workforce at 37.4 percent. By 2001, however, the labor movement represented just 9 percent of private nonagricultural workers. As in the 1980s, much of the union growth that occurred during the 1990s was a result of mergers. Two of the larger mergers occurred in 1995 when the International Ladies' Garment Workers' Union joined with the Amalgamated Clothing and Textile Workers to form the Union of Needletrades, Industrial, and Textile Employees (UNITE), and the United Rubber Workers affiliated with the United Steel Workers. Some continued to argue that mergers increased the union's bargaining power, and efficiency critics claimed that mergers lacked strategic focus. Critics argued that instead of merging with writers and university employees, the UAW and UMWA should focus on organizing the numerous nonunion workers in their industries.

Strikes

Workers continued to lead militant and successful strikes to improve their conditions in the 1990s. Although the number of strikes of at least 1,000 workers dropped to a ten-year low in 1995, strike activity increased in the following years. In 1996, the number of strikes rose to 37 from 31 in 1995 and involved 273,000 workers compared to 192,000 the previous year. In 1997 and 1998, these figures jumped to 339,000 and 387,000 workers on strike, respectively.

The strikes of the 1990s focused less on wages and benefits and more on fighting a growing corporate trend toward "lean production," a trend that involved downsizing, outsourcing production to nonunion subcontractors, and increasing workloads. Between 1990 and 1998, UAW local unions led twenty-two strikes against General Motors, in large part to protect jobs and prevent outsourcing.

In 1998, two strikes by the UAW at two key GM parts plants in Flint, Michigan, the Flint Metal Center and Delphi parts plants, virtually shut down GM and forced the company to retreat from its plans to outsource jobs. The strikes cost GM over $1 billion in profits, forced the company to close twenty-seven of its twenty-nine assembly plants, and idled close to 200,000 workers. The success of the strike was partly the result of corporations' shift to Just-in-Time production, which reduced its parts inventory and dispersed its production facilities, which allowed workers at strategically located plants to disrupt the entire chain of production.

The year before the Flint autoworkers struck, the Teamsters led a dramatic and successful strike against United Parcel Service (UPS). UPS, like many corporations in the 1980s and 1990s, had shifted toward part-time temporary labor and had moved toward outsourcing. Close to 60 percent of its diverse workforce of women, men, blacks, and Latinos worked part-time, and the company planned to subcontract the work of its full-time drivers. The starting part-time pay of $8 per hour had not increased since 1982, and many part-time employees worked over the thirty-five hour maximum for part-time work but were denied full-time pay and benefits.

The work was fast, with sorters handling around 1,200 packages an hour. In August, 180,000 UPS workers struck for higher wages and sought to force the company to turn 10,000 of its part-time jobs into full-time jobs. The strike was widely supported by Americans who responded to the Teamsters' demand for decent jobs. After fifteen days, UPS settled, promising to create more full-time jobs and to increase full-time pay by 15 percent and part-time pay by 37 percent.

Not all unionists struck or organized traditional unions to improve their conditions. A number of Latina and Asian immigrant women who labored long hours in sweatshops around the country built innovative labor organizations to challenge exploitation. In 2001, thousands of mostly immigrant women worked in 22,000 garment shops in the United States. Subcontractors often manufactured the clothes for retailers like K-Mart, Wal-Mart, Dayton Hudson, and Nordstrom.

Sweatshop workers sometimes earned less than $2 per hour, worked more than 100 hours per week, and suffered injuries from hours of back-bending labor on sewing machines. The women's immigrant status made them especially vulnerable to abuses. In New York, the community-based Chinese Workers and Staff Association (CWSA), formed in 1979, became an important vehicle for Chinese women to improve their conditions. The CWSA provided a welcome alternative to traditional unions that sometimes either ignored or misunderstood immigrant workers or treated them disrespectfully. The CWSA offered language, citizenship, and women's empowerment classes and in the 1990s led a growing number of campaigns against sweatshop abuses. In the early 1990s, the CWSA started a back-wage campaign to reclaim unpaid wages and in 1996 led a campaign against workplace injuries. Other community-based labor groups emerged around the country to advocate for immigrant workers such as the Korean Immigrant Workers Advocates, the Asian Immigrant Women Advocates, La Mujer Obrera, and Fuerza Unida.

Politics

The labor movement increased its level of political activism. In 1996, the AFL-CIO launched a high publicity campaign spending $35 million to reelect Clinton and Gore and elect pro-labor candidates. At the same time, the labor movement proved more willing to challenge their Democratic allies. In 1995, labor lobbied to defeat the Clinton-backed NAFTA and in 1997 helped build a broad-based campaign to defeat a fast-track trade proposal to give the president broader authority to negotiate trade agreements. Fast track did not require the president to include any labor or environmental protections in the trade agreements. In 1999, the AFL-CIO and several affiliated unions joined a wide coalition of religious, student, environmental, gay and lesbian, animal rights, and human rights groups to protest the World Trade Organization at its meeting in Seattle at the end of November. The labor movement was particularly concerned about the WTO's effect on labor rights abroad and its role in facilitating capital flight from the United States.

AFL-CIO leaders Linda Chavez-Thompson and John Sweeney addressed protesters in Seattle and led a march of 50,000 trade unionists. Other trade unionists, in the face of police batons and pepper spray, joined in nonviolent sit-downs that prevented WTO representatives from entering their meetings. The "Battle of Seattle," as it became known, revealed a growing dissatisfaction with unregulated globalization and the willingness of diverse social movements to make alliances. Labor's concern with the effects of globalization led unions in the United States to strengthen their ties with progressive activists and unions in other countries who were leading campaigns to improve workers' lives.

Conclusion

The last two decades of the twentieth century were some of the most difficult years in U.S. history for the labor movement. Union membership declined dramatically, strike activity slowed, and union members accepted reductions in their wages and benefits. The conservative political environment, free-trade policies, and the loss of manufacturing jobs and growth of nonunion service jobs made it increasingly difficult to build the labor movement. Workers earned less and worked harder as corporate profits soared. Unionists

also had to confront increased diversity in their ranks as women, immigrants, and people of color began to make up a majority of organized labor. But the labor movement survived and met these challenges creatively. Rank-and-file reform movements, strikes against concessions, campaigns against plant closings, grassroots organizing methods, political mobilizations, and community and labor alliances provided important alternatives to economic exploitation and offered hope for an equal and just society.

PATCO and Replacement Workers

On August 3, 1981, over 12,000 air traffic controllers left their jobs with the U.S. Federal Aviation Administration (FAA), staging a walkout in defiance of a law that prohibits federal workers from undertaking strikes. President Ronald Reagan warned the disgruntled members of the Professional Air Traffic Controllers Organization (PATCO) that he would permanently replace them if they did not return to work within forty-eight hours. When roughly 11,300 controllers remained on strike, Reagan authorized their permanent replacement on August 5, 1981, banning them from reemployment with the FAA. PATCO, the controllers' union, was subsequently decertified and broken. As the most significant union-busting event of the post–World War II era, the PATCO debacle represented a turning point in U.S. labor history. It marked the end of a half-century during which employers rarely attempted to break an established union during a strike.

The Use of Replacement Workers in Strikes Prior to 1981

Prior to the advent of the New Deal in the 1930s, U.S. employers regularly exercised their common-law right to permanently replace workers on strike. Blacklists were common during this era, and employers enforced them through private employment bureaus and labor spies. But the passage of the National Labor Relations Act, also known as the Wagner Act, in 1935 altered this situation, granting workers the right to organize and bargain collectively, spelling out unfair labor practices that employers were forbidden to undertake. By the end of World War II, employer efforts to break unions on strike by operating with replacements were increasingly rare events.

The use of permanent replacements to break strikes became rare even though the law continued to recognize private employers' rights to use this tactic. In the midst of labor's resurgence in 1938, the U.S. Supreme Court issued a decision in the case of *NLRB v. Mackay Radio and Telegraph* that clarified these rights for employers. In its opinion in the case, the Court held that the Wagner Act allowed management to permanently replace strikers in economic strikes in cases where the conditions of employment rather than unfair labor practices were at issue, as long as employers could prove that legitimate and substantial business interests were served by this strategy.

For many years after World War II, employers generally did not attempt to make use of their *Mackay* rights. Employers' reluctance (or inability) to exercise those rights was one of the hallmarks of what some call the era of "labor–management accord" following World War II. On those occasions when employers did use replacement workers, union members usually reclaimed their jobs after strikes were settled (sometimes working side by side with replacement workers) and a union contract usually still obtained. In the 1960s, the courts issued a series of decisions that regulated the treatment of replacement workers and returning strikers, protecting the rights of union members from management discrimination in favor of replacement workers in the aftermath of a strike settlement. Operating under such decisions, employers who did make use of replacement workers usually did so to gain bargaining leverage against a union in a negotiation that assumed that the union itself would survive.

By the 1970s, however, labor–management relations deteriorated, and a variety of developments gave employers both the opportunity and the incentive to consider aggressive tactics to break union power. The weakening of the labor movement's allies on the national political stage; the growth of global trade; the comparative high costs of union labor in the United States; the refinement of management tactics of union avoidance; and the possibilities of dramatically increased profits in nonunion environments—these were among the factors that both prodded and enticed private sector employers into an increasingly

hostile stance toward unions. Yet while private employers grew increasingly anti-union by the 1970s, they did not embrace the tactic of permanent replacement of strikers until the 1980s. Had not the federal government led the way, private sector employers may not have used striker replacement as a tactic as early and as effectively as they subsequently did.

The PATCO Strike

The 1981 PATCO strike was a turning point long in the making. PATCO formed in 1968, six years after President John F. Kennedy issued Executive Order 10988, which allowed federal employees to organize and bargain collectively. Since its formation, PATCO had emerged as one of the most aggressive government employee unions in the United States. PATCO initiated slowdowns in 1968 and 1969 that snarled air traffic around the United States to dramatize the poor working conditions that characterized the nation's air traffic facilities. In an effort to secure its organization, PATCO staged a massive sick-out in March 1970 that curtailed air travel across the nation. Despite the FAA's vow that it would terminate the thousands of 1970 "strikers," no such threat was carried out, and PATCO won official recognition as the bargaining unit of air traffic controllers. Over the course of the 1970s, PATCO initiated several more slowdowns to advance its agenda. These were usually successful, though the FAA grew increasingly determined to battle PATCO as the decade wore on. By the late 1970s, the FAA's increasing intransigence led to a growing sentiment among PATCO members that the union would never get a satisfactory contract that addressed pressing issues of workplace stress and underpay until it could effectively shut down the nation's airports by a walkout. If that walkout was successful, PATCO activists reasoned, its illegality would be inconsequential. Just as the government rehired controllers following the 1970 sickout, the government would be forced to rehire controllers after a successful national strike.

Beginning in 1978, PATCO leaders began planning for that strike. PATCO created a network of local union activists to coordinate the walkout. Dubbed "Choirboys," the activists generally did not come from the ranks of elected union officers. Their identity was not publicized so that they could coordinate a walkout even if the government arrested elected union officials for striking in defiance of legal injunctions. Over time, the Choirboys became a powerful faction within the union, pushing for a strike in 1981 behind the slogan "Be One in '81." The Choirboys' influence helped shake up PATCO's national leadership in January 1980. At that time, PATCO's executive board delivered a no-confidence vote to the union's president, John Leyden, who had held the union's presidency since 1970. Union militants saw Leyden as too moderate to lead a major illegal strike against the government. Leyden promptly resigned and was succeeded by the union's vice president, Robert Poli, who had been in charge of formulating the 1981 strike plan. Under Poli's leadership, the strike preparations gathered momentum.

That momentum only temporarily subsided when PATCO endorsed Ronald Reagan's successful campaign for the presidency in 1980. Reagan sought this endorsement by promising PATCO that if elected he would work to address controllers' grievances. When PATCO's contract expired in March 1981, however, the union found the Reagan administration to be a tough negotiating partner. After months of contentious bargaining, a near strike in June 1981, and the failure of PATCO's membership to ratify a tentative contract offer in July 1981, PATCO finally voted to strike on August 3, 1981.

The FAA had been planning for this strike for many months. The agency immediately implemented a contingency plan under the direction of FAA administrator J. Lynn Helms, a former aviation industry executive who prided himself on his ability to deal forcefully with unions. Helms's plan saw airlines cancel thousands of flights, supervisors step in to take on controllers' duties, and the Defense Department assign hundreds of military controllers to the jobs of strikers. Meanwhile, the full force of the government came down on the PATCO strikers even as replacement workers were hastily trained. Around the country, U.S. attorneys sought injunctions and costly fines against PATCO officers, and several strike leaders were arrested for contempt of court for refusing to obey injunctions. Most important, President Reagan strode into the Rose Garden hours after the strike began to warn controllers that if they didn't return to work they would be permanently replaced. Although less than 10 percent of the strikers heeded Reagan's warning, the president followed through on his threat.

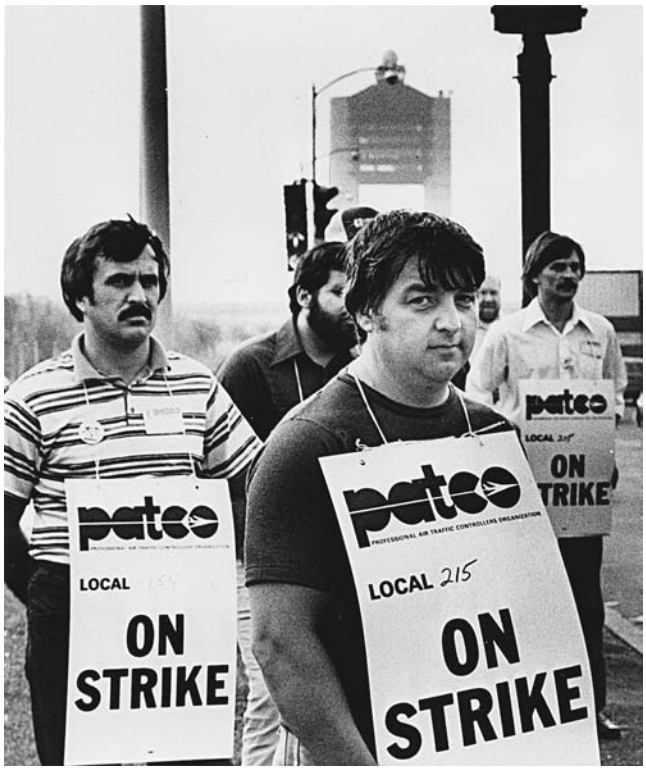
Public opinion polls showed that most Americans initially backed Reagan's response to the strike. Attempting to sway public opinion in a more favorable direction, the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) immediately expressed support for PATCO. Yet national union leaders were privately outraged that PATCO never consulted with other aviation industry unions or the AFL-CIO prior to calling its walkout. In the end, the

AFL-CIO rejected calls for sympathy strikes or mass pickets to close down airports. Instead, the AFL-CIO confined its support for PATCO to fundraising for strikers' families, issuing public statements in favor of a negotiated solution to the strike, and making Reagan's intransigence a major theme of the September 19, 1981, Solidarity Day demonstration, which drew hundreds of thousands of unionists to Washington, D.C. Grassroots support for PATCO among union activists around the country was strong, as many activists saw Reagan's stand against PATCO as signaling the onset of an aggressive new anti-union drive in the United States. Yet grassroots support for PATCO was unable to force the Reagan administration to back down, and PATCO was successfully broken.

Striker Replacement and the Diminishing Effectiveness of Strikes since 1981

It is doubtful that any private sector employer could have engaged in such a costly effort to replace union strikers. By some estimates, it took years for the nation's air traffic system to recover from the firing of PATCO strikers and cost taxpayers billions of dollars, although it is difficult to assess the strike's ultimate cost. Significantly, the permanent replacement of thousands of striking air traffic controllers, whose technical skills had led many to assume that they were irreplaceable, shocked trade unionists and galvanized many private sector employers. In the years immediately following the PATCO strike, a number of highly visible private sector employers followed Reagan's lead. Hormel, International Paper, Greyhound, and Phelps Dodge were among the corporations that employed permanent replacement strategies during strikes in the decade following the PATCO walkout. Although strikers' ability to regain their jobs in these strikes was limited, the Supreme Court strengthened the hands of replacement workers in 1983 by finding that they could not be legally dismissed in favor of returning strikers if their employer had recruited them with the promise of retaining them.

Employers' willingness to permanently replace strikers in the aftermath of PATCO dramatically eroded the effectiveness—and hence the incidence—of strikes in the United States. Between 1947 and 1980, the Bureau of Labor Statistics reported at least 180 strikes each year involving more than 1,000 workers each in the United States. Since 1982, the number of such strikes has never once reached even half that level. Rather, figures showed a sharp decline from the 235 strikes involving a total of one million workers in 1979 to a record low of 17 walkouts, involving only 73,000 workers, two decades later in 1999. Between 1947 and 1980, the United States averaged 300 major strikes annually. In the years between 1981 and 2000, the annual average was 47 major strikes.



At Logan International Airport in Boston, members of PATCO, the Professional Air Traffic Controllers Organization, picket on August 3, 1981, the day 12,000 union members went on strike. President Reagan hired replacement workers—or "scabs," as strikers called them—and broke the strike, dealing a major blow to the American labor movement. *(AP Wide World Photos)*

In the 1990s, several unsuccessful efforts were made to prohibit employers from permanently replacing strikers. H.R. 5, passed by the U.S. House of Representatives in 1991, would have eliminated the permanent replacement tactic, but labor could not muster the sixty votes required to bring the bill to a vote in the Senate. In 1993, a similar bill failed to survive a Senate filibuster. Since the Republican takeover of the House of Representatives in 1994, there has been little prospect of altering the law on this issue. When President Bill Clinton signed an executive order in 1995 prohibiting the federal government from doing business with firms that permanently replaced strikers, court decisions effectively gutted the order

and left the *Mackay* doctrine intact. Meanwhile, courts made clear that the votes of replacement workers could be counted in efforts to decertify unions after strikes. The failure to alter such legal doctrines greatly diminished workers' practical right to strike in the United States.

The result was that in the years after 1981 credible strike threats by U.S. unions became increasingly rare. Significantly, the effective use of the strike weapon failed to improve even during the economic boom of the mid-1990s, even though unions have traditionally used strikes more effectively during periods of economic growth. Although the outcome of the PATCO strike alone was not responsible for organized labor's diminished power, the precedent that the 1981 strike set for the permanent replacement of striking workers was undeniable. Ultimately, no single event better symbolized the declining fortunes of U.S. trade unionism as the twentieth century drew to an end.

United Parcel Service Strike

During the summer of 1997, the Teamsters waged a fifteen-day strike against the Atlanta-based United Parcel Service (UPS), garnering overwhelming public support and winning wage increases along with a promise of 2,000 new full-time jobs. This was ultimately a promise on which the company did not deliver, and UPS workers continue to struggle for secure full-time positions. However, the 1997 UPS strike was the largest ever waged by the Teamsters against a single employer. It brought public attention to the problem of job casualization—the increasing reliance on low-paying, part-time workers who are given neither benefits nor job security.

At a time when the weakened labor movement struggled to deal with a new, increasingly casualized service economy, the Teamsters waged a very public struggle that attempted both to highlight the labor demands of this new workforce and to redeem the Teamsters themselves from the internal political corruption for which they had become so famous.

At the time of the strike, UPS was America's third-largest private employer, with more than 300,000 workers, two-thirds of whom were Teamsters members. The company delivered about 12 million packages each day, carrying 80 percent of the country's ground delivery. The Teamsters walkout brought UPS trucks across the country to a standstill, ultimately costing the company more than $750,000. It also allowed UPS's main competitor, Federal Express, to double its ground delivery business at the expense of a long-time UPS monopoly on ground transport of goods.

UPS strikers had the support of the public from the early days of the strike; at times the public favored the strikers two to one over the company. The conflict was highly visible, both in the press and on front porches and doorways across the country. The Teamsters' clear victory in the arena of public opinion served as a catalyst for effective organizing campaigns across the country, from corrections officers on the West Coast to fast-food employees in the Midwest and Canada. Part-time workers nationwide benefited from new public awareness of their position in the workforce and the extent to which they were exploited by large corporations.

A Show of Labor Strength at a Time of Labor Weakness

The years leading up to the UPS strike were difficult for the labor movement. Depressed wages, increased hours, and poor access to affordable housing and health insurance had plagued American workers since the 1970s. Weakened unions, bad contracts, and what labor historian Robert H. Zeiger called "general antagonism toward unions" set the backdrop for the UPS struggle. In 1981, the Reagan administration stifled a strike of 13,000 air traffic controllers, ushering in an era of labor defeats both on the picket line and in law and public policy. One legislative blow after another hindered workers' attempts at halting casualization, improving wages and benefits, and strengthening both contracts and membership rolls.

Between 1978 and 1991, the Teamsters union—like its counterparts in the building, auto, and steel trades—saw membership losses of more than a half-million members. This loss has been credited to a combination of the loss of manufacturing jobs, generational distrust of unionism, and the labor movement's inability to organize the growing ranks of service and clerical employees. Whereas public sector unions experienced measurable growth, private sector unions suffered dramatic losses. At the same time, a trend toward the permanent replacement of striking workers raised the stakes for work stoppages. The 1981 air traffic controllers' strike ended with permanent replacements. Greyhound Bus Company permanently replaced its striking drivers in the spring of

1990, and in 1992, management at the Caterpillar Tractor factory in Peoria, Illinois, permanently replaced 13,000 strikers.

In the 1980s and 1990s, union-busting law firms flourished as corporations took advantage of a management-friendly National Labor Relations Board (NLRB), often dragging labor grievances through the courts for up to and exceeding three years. Although there were laws to protect the rights of workers, employers could break them without much fear of reprisal. The proceedings required to hold management accountable for such violations were too costly and time-consuming for most weakened unions to endure. The adverse conditions for labor during the years leading up to the Teamsters strike at UPS underscore the intensity of the union's fight and the magnitude of its accomplishment.

Issues

The 1997 UPS strike involved three major contract issues: the hiring of part-time workers and its resultant two-tiered wage structure, job safety, and control of worker pensions. The Teamsters' pension plan, often the subject of highly publicized tales of Teamsters corruption (culminating in a 1989 lawsuit that led to outside supervision of the funds), required UPS to pay into a pension fund that supported both Teamsters members in UPS jobs and those who drove for other employers. UPS wanted to terminate its involvement with the Teamsters plan and support its workers independently, which they claimed would increase pension payment to workers by more than 50 percent. UPS asserted that the part-time issue, for which the Teamsters enjoyed such overwhelming public support, was simply a smokescreen for the pension concern. Management charged that the Teamsters drivers were essentially striking to maintain corrupt financial practices by protecting their right to retain control of worker pensions.

Although the Teamsters' reputation for corruption and shady financial dealings was no secret, those who drove for UPS faced serious wage and job security issues that were anything but a smokescreen. By the time of the strike in August 1997, nearly 60 percent of UPS employees were part-time workers earning an hourly wage of approximately $9. By contrast, full-time workers doing the same jobs made approximately $20 per hour. Between 1993 and 1997, UPS filled 40,000 to 45,000 new union jobs, and more than 80 percent of these were of the part-time variety. These part-time employees, most of whom received no benefits, often put in full-time hours at their second-tier salaries.

Fighting "to save the American dream," thousands of United Parcel Service workers—including these members of the Teamsters in Chicago—went out on strike in August 1997. The strike proved largely successful, as workers won wage increases and promises of new jobs. *(AP Wide World Photos)*

Fighting for Job Safety and Security: Countering Management's Contract Campaign

In the years leading up to the strike, drivers continued their ongoing fight for job safety. In the winter of 1994, in an attempt to increase productivity, UPS management raised the package weight limit from 70 pounds to 150 pounds without consulting the union and without increasing safety standards or precautionary measures. Full-time and part-time employees joined forces to mobilize for a February 1994 safety walkout in protest of the new weight limits. A few months later, the Teamsters' International launched what would turn out to be a three-week strike against a number of

major trucking companies in response to the proliferation of $9-per-hour part-time positions. Although this Teamsters attack on corporate exploitation of part-time drivers predates the 1997 UPS strike that garnered so much public attention, it wasn't until the familiar workers in their brown uniforms moved from trucks and front porches to picket lines that the general public, by a two-to-one margin, expressed support for the Teamsters.

Following the 1995 three-week strike, UPS intensified its "Team Concept" campaign, an initiative taken by many large corporations in the early 1990s to undercut worker organizing and assert company control over worker concerns. For UPS, this meant preventing coalitions between part- and full-time workers. The goal was for employees to feel as though they had a voice in the decision-making process through participation in "work teams" organized by management to consider workplace issues; the upshot was the undermining of workers' right to collective bargaining. The Teamsters responded with its own campaign that included a widely circulated video, "Actions Speak Louder Than Words," in which they pressed issues of job safety, wages, benefits, and increased reliance on part-time labor.

Over the next few years, as contract deadlines approached and negotiations commenced, stalled, and started again, part-time workers across America grew increasingly frustrated. Movements like Jobs for Justice, women worker rights groups, and Occupational Safety and Health coalitions gained steam as UPS workers across the country prepared to walk off the job, giving up salaries of up to $50,000 per year for strike pay of about $55 per week.

UPS management launched a number of contract campaigns in the months—and even years—leading up to the August 1997 strike, most of which served only to fuel rank-and-file organizing. Although the company was making more than $1 billion a year in profits, it expanded subcontracting, granted lower wage increases, and continued to hire part-time workers. Management's required "pre-work communication meetings" attempted to undercut union organizing, but the 206 Teamsters locals with UPS employees countered with strong member-to-member networks. The international union immediately assigned nineteen field staff to boost organizing efforts and take on UPS's expensive and extensive contract campaign. By contrast, the union's campaign, based on networking and worker and community unity, spent nothing on advertising or promotion.

From Negotiation Table to Picket Line to Headline

The Teamsters' strategy centered around uniting part-time and full-time workers to support more full-time positions and better contracts for all. Their video, "Make UPS Deliver," emphasized the common interest of all UPS workers. As the first round of contract negotiations approached, the union organized workplace rallies in seven cities. Before the next round of negotiations, the number of rallies doubled. Tens of thousands of workers participated in job security rallies, blowing high-pitched whistles outside of UPS office buildings. Efforts to unite part- and full-time workers proved fruitful, and six weeks before contract expiration, 100,000 Teamsters signed a petition for the creation of more full-time positions.

On Thursday, July 31, 1997, UPS contracts expired. For the next few days, heated and intense negotiations ensued at which UPS offered one "final offer" after another. Each offer was followed by a union counterproposal reflecting the union's three principal demands: more full-time positions, control of the pension program, and greater attention to job safety. When UPS management refused to concede, Teamsters officials walked out on negotiations at 10 P.M. on Sunday, August 3, marking the official start of the strike.

The following morning the story broke with reports that 2,000 UPS pilots would honor the Teamsters' picket line. UPS announced that, while operating at 30 percent capacity, they were prioritizing the delivery of medical supplies, which would be delivered by nonunion drivers and management. President Bill Clinton expressed concern for the scale of the walkout and voiced vague sentiments of support for the hundreds of thousands of employees, stating he would not intervene in the dispute.

Despite public support for UPS management on the sparsely publicized pension issue, Americans saw their UPS men and women as a part of their community. This was partly the result of the company's own emphasis on customer service. The courteous, conscientious service that UPS demanded of its employees made its delivery men and women friends and neighbors to their customers. That summer, *Time* magazine listed UPS workers among "Elvis impersonators and telecom execs" as the top "winning" American occupations. "Americans don't like strikes," the author proclaimed, "but they love their delivery guys." Only ten days into the strike, a Gallup poll

showed 55 percent of the public supported the strikers, while only 27 percent supported the company.

Organizing Door-to-Door and Coast-to-Coast

The strikers' public support did not come without considerable effort. Local unions held family days to bring community members into rallies. Strikers went door-to-door in local communities to explain the strike issues. Rank-and-file workers—familiar faces in the cities and towns to which they delivered—served as central and highly visible media spokespeople. The Teamsters personally carried surveys and fliers to UPS members around the country. Just as their UPS delivery drivers brought door-to-door service to UPS customers, Teamsters organizers launched a community-based campaign relying on close personal networks and face-to-face communication.

Support from workers of all kinds throughout the country brought more media attention to the strike. In Manhattan, 2,000 telephone workers marched in support of the striking UPS workers. High-profile political leaders, including Jesse Jackson, also joined the picket line. The strike became an international effort as UPS workers in Europe wore stickers, passed out leaflets, and blew whistles outside company headquarters. German employees wore white socks, drawing attention to their usually dark ankles to demonstrate their support for the American UPS strikers. With Congress on vacation and the summer news characteristically slow, the UPS strike was a national front-page story.

The Teamster Image: Internal Union Politics and the UPS Strike

Increased media attention forced the Teamsters to prioritize their public image at a time when a strong, united body of leadership was most vital. Internal reform initiatives such as UPSurge and Teamsters for a Democratic Union (TDU) dated back to the 1970s and worked to democratize the leadership while improving the image of a union that was historically fraught with allegations of corruption. This reputation for scandal predated both the "disappearance" of Teamsters boss Jimmy Hoffa Sr. and the 1957 expulsion of the Teamsters from the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) for its alleged unsavory dealings with the mob. Since the 1970s, these reform movements within the union have variously divided, weakened, united, and strengthened the Teamsters, but one thing remained constant for UPS drivers: management's continued attempts to casualize the workforce and depress wages. The TDU's reform efforts culminated in 1991 with the first direct election of the Teamsters' international leadership. Newly elected Teamsters president Ron Carey was a twelve-year veteran driver who rode to victory on an anti-corruption platform.

Often, union politics compromised both the strength of contracts and the loyalty of workers to their union leadership. In 1982, the "old guard" Teamsters higher-ups approved an $8 per hour wage freeze for part-time workers. This settlement laid the groundwork for the two-tier wage structure that the company cultivated throughout the years by dividing part- and full-time employees. This division further weakened the internally strained and increasingly member-poor union, sapping worker loyalty to a leadership often seen as unresponsive to worker needs and overly responsive to company recommendations. Even reform leader Carey's anti-corruption platform would eventually prove ironic following the post-strike reversal of his 1996 reelection in light of charges of campaign finance improprieties.

Political unrest and allegations of corruption within the Teamsters only exacerbated the tensions in the rank and file's relationship with its union. In 1989, following charges of corrupt financial practices, the courts ordered independent supervision of the Teamsters' pension program. It was this same pension system that would become one of the major contract issues during the 1997 strike.

The Outcome

In retrospect, UPS seems an unlikely corporation to battle successful union mobilization. A close eighty-two-year relationship between the Teamsters and UPS management, and a low 4 percent job turnover rate, suggest that a walkout would have been unlikely. UPS drivers were among the highest paid in the country. But UPS's reputation as a "good employer"enabled it to mask its exploitative hiring practices and wage structure, and it was this two-tiered wage system that set the company up for attack. By fostering such a divided workplace, UPS made the inequalities more visible, illuminating for both its workers and the general public its own attempts to transform its payroll into a fully casualized workforce.

The effective community and network-based organizing carried out by new Teamsters leadership and rank-and-file members gave UPS what one magazine

writer called a "public relations thrashing," and the contract that was settled on August 18, 1997, brought an increase in hourly salaries of $3.10 for full-time employees and $4.10 for part-timers. UPS also promised thousands of new full-time positions to reverse the casualization trend. Despite worker gains and company embarrassment, the limitations of the 1997 UPS strike illuminate two of the challenges facing labor: internal union politics and the uncooperative nature of American law and legislation when it comes to labor relations. Just as the outcome of the strike ultimately proved to be a disappointment when UPS failed to deliver on many of its promises for new full-time positions, the progress toward Teamsters union democratization was ultimately mired in charges of inappropriate financial practices during Carey's reelection campaign.

Repercussions: Corporate Recovery and the Return of the Old-Guard Leadership

Shortly after the strike, Carey's 1996 reelection was overturned in response to financial corruption charges levied against some of his campaign staff (although not against Carey himself). UPS stalled on its contract promises, while the reinstated old-guard union leadership, led by James Hoffa Jr., instituted a nonaggressive course of action, following normal grievance procedures to address the company's inaction.

UPS struggled to recover from the financial damage caused by the strike, emphasizing more profitable services like next-day air, cutting back ground service, and laying off more than 100,000 workers, many of whom were full-time employees. Ground service suffered substantially because Federal Express had picked up much of UPS's lost business. UPS attempted to bounce back through a new computerized management system by which drivers were expected to make up to twenty deliveries in an hour based on computerized productivity calculations. This "Taylorization" of the delivery process severely compromised the customer service that had made UPS so successful.

The company's public image and business reputation also felt the effects of cutbacks in truck cleaning and maintenance. UPS stonewalled on its promises to create more full-time positions, claiming it could not do so until it had more ground business, while at the same time cutting back on ground delivery services. A year after the end of the strike, many UPS employees were still filing grievances about management harassment and retaliation, despite company claims that morale remained high.

The Fight Continues

The tensions that surfaced five years later, as the 1997 contract neared expiration, showed that the struggle for more full-time positions, improved wages, and stronger contracts had not ended. In May 2002, Teamsters nationwide voted by a 93 percent margin to approve another strike. The rocky relationship between UPS and the union was only further disrupted by what the Teamsters saw as newly elected Republican president George W. Bush's close alliance with UPS management. Indeed, the company's top executives donated more than $300,000 to the campaign to elect a leader whose record, unsurprisingly, was not union-friendly. Between the 1997 strike and the year 2001, UPS increased its revenue by 36 percent while increasing the starting wage of part-time workers by only 50 cents per hour.

With a contract expiration date of July 31, 2002, UPS and the Teamsters hoped to avoid a work stoppage by beginning contract negotiations in January of that year rather than waiting until June as they had in 1997. The climate for negotiation was different this time in a number of ways. The shipping giant that had once controlled nearly 80 percent of the ground delivery market now could claim only 55 percent. Furthermore, its share faced new threats from the U.S. Postal Service, which planned to release a new "delivery confirmation tracking service" that summer to compete with private shipping companies.

Sixteen days before the contract was set to expire, Teamsters officials conditionally (upon ratification of its membership) approved a much stronger contract than they had won with a strike five years earlier. In what was, at the time, the largest private sector contract negotiation of 2002, Teamsters won a 22 percent pay increase over six years and a guarantee of 10,000 new full-time positions. This amounted to a $5 hourly increase for full-time workers and a $6 increase for part-time workers over the course of the six-year contract. The new contract also offered improvements in health insurance and benefits for retirees and part-time workers, as well as limits on excessive overtime. This 2002 settlement narrowly averted a repeat of the protracted 1997 conflict. The gains won in 2002 would have been impossible without the massive organizing efforts of those who struck five years earlier.

Hotel and Restaurant Workers Movement

The Hotel Employees and Restaurant Employees Union (HERE) emerged in the latter part of the twentieth century as one of the most progressive unions in the United States. This change from a relatively conservative history was based on the election of young militant leaders, like Maria Elena Durazo, president of Local 11 in Los Angeles. The new philosophy of the union was based on the importance of rank-and-file involvement; the necessity to include documented and undocumented immigrant workers in the union movement; the need to build strong labor–community coalitions; and organizing as a priority to provide a quality life for working people.

By the mid- to late twentieth century, the hospitality industry had changed as a result of mergers and takeovers, resulting in firms that did not honor previous contracts and the influx of immigrant workers, many undocumented. Although the industry was growing, the union was faced with a declining membership. The conservative leadership did not see organizing as a priority and were resistant to the idea of organizing immigrant and women workers. The union leadership was not responsive to the needs of its members, many of whom were Spanish speaking. The union leadership operated on the mistaken idea that labor-management accords would build the union. By the 1980s, young organizers came to the fore and began a struggle to wrest control from the entrenched leadership. Since they were closely tied to the rank and file and attuned to their needs, they eventually won control and changed the nature of the union by making organizing a priority, especially the inclusion of immigrant workers. HERE collaborated closely with unions holding a similar philosophy. It built strong labor–community coalitions, fought for amnesty for immigrant workers, launched bold and creative organizing campaigns, and set an example for all working people. In the modern era, the union represented more than 300,000 members in over 120 local unions in the United States and Canada.

Union History and Organizing Drives

HERE began in 1891 as an American Federation of Labor (AFL) union for bartenders, porters, cooks, maids, waiters, and waitresses. The union grew from 10,000 in 1901 to 300,000 in 1945. As was true of all AFL unions, for many years the international union was organized along craft lines, with locals representing waiters, bartenders, cooks, and waitresses. In 1973, international president Edward T. Hanley sought to merge all locals to represent members by industrial affiliation rather than craft.

A Las Vegas, Nevada, strike in 1984 proved a major landmark for the international union. The casino owners made a concerted effort to destroy the union, but the union waged a successful strike. After sixty-seven days, in one of the longest, most violent and bitter strikes in Las Vegas history, a number of hotels, including the MGM Grand, the Tropicana, and the Sands, settled. Then, in 1991, members of the Culinary Workers Union Local 226 and Bartenders Union Local 165, both HERE affiliates, struck the Frontier Hotel and Gambling Hall in Las Vegas. This strike lasted six years. Not one of the 550 striking workers crossed the picket line. Although the Frontier was bought by Bellagio Resort Hotel and Casino in 1998, the new owners accepted the union contract. Creating an organizing environment for other casino workers, HERE's membership grew to 20,000 in Las Vegas. By the twenty-first century, Las Vegas was one of the most unionized cities in the nation.

The experiences of Los Angeles's Local 11 serves as an example for the history of the union in the mid- to late twentieth century. Local 11's president, Maria Elena Durazo, provided leadership that revitalized the Los Angeles labor movement. Coming to HERE in 1983 from a long involvement in labor–community

After a six-year-long strike, picket signs fill a garbage can at the Frontier Hotel and Casino in Las Vegas on October 28, 1997. The strike by the Culinary Workers Union and Bartenders Union forced owners to sell the property, spelling the end of the walkout. *(AP Wide World Photos)*

organizing in the International Ladies' Garment Workers' Union (ILGWU), Durazo was shocked by the racism in Local 11. Despite the fact that the majority of members were Latino immigrants, the white male union leaders refused to translate the meetings into Spanish and were not attuned to members' needs.

HERE workers saw wages and benefits deteriorate as the hospitality industry was taken over by multinationals, who engineered decertifications of the union. A radical change was needed that would take into account the changing face of the workforce and industry. Backed by Latino groups, community, religious, and academic groups, and sympathetic unions, Durazo undertook a campaign to win the presidency and control of Local 11 in 1987. The campaign was ugly. Ultimately, the international intervened and placed the local under its trusteeship for two years but with Durazo as a staff director. Working with the international strengthened her support in the local. Two years later, in 1989, Durazo was elected president with little opposition and began to put her plans into practice.

Under her leadership, Local 11 set an example for all working people by utilizing a variety of street and media tactics to publicize its cause. Backed by the international, the local undertook extensive research and community outreach both to maintain its membership and to organize the nonunion workers in the industry. The local recognized the necessity to organize the immigrant workforce, including the undocumented. Members staged sit-ins in hotel lobbies, committed civil disobedience in busy intersec-

tions, and engaged in many visible, lively demonstrations and rallies. The public demonstrations won much support for the workers' cause.

The union produced a controversial video, *City on the Edge,* showing the social inequities and class stratification of Los Angeles. The video portrayed how low-wage jobs were contributing to the overall decay of Los Angeles's infrastructure and why the tourist industry had a responsibility to reverse this trend. Ironically, the video was released at the exact time of the civil unrest, which took place throughout Los Angeles in 1992. Responding to the publicity, the Hotel Employers Council agreed to settle health and pension benefits, which covered 5,000 Local 11 workers.

Organizing nonunion workers was a much more difficult challenge. But Local 11 argued that the city of Los Angeles could not recover or be rebuilt from the 1992 civil unrest, unless workers received a living wage. Coming from an immigrant farmworker family, Durazo understood well that it was vital to include immigrant labor as part of the organized labor movement. Most unions prior to the 1980s were resistant to this idea, but the International Ladies' Garment Workers' Union (ILGWU) was openly organizing immigrant labor and working with community groups to teach immigrant workers their rights. Durazo, who received her initial union organizing experience in the ILGWU, applied this training to HERE and won major contracts for Hyatt Hotel workers, some airport hotel workers, and downtown hotel workers. Local 11 firmly believed in making house visits to workers, building labor–community bridges, and generally getting workers involved in their own battle for unionization.

HERE Local 2 represented 13,000 workers in the San Francisco Bay Area by the twenty-first century. Similarly to other areas, more than half the members were women and over 70 percent people of color, mainly immigrants from all over the world. Until the 1970s, the leaders were older white males. In the mid-1980s, women of color ran for office, and one won the presidency. The union staff consisted of members of every race, nationality, sex, age, and every workplace department. The local argued that immigrant issues and women issues were concerns for all workers. Similarly to other areas, Local 2 worked closely with community groups, especially immigrant worker groups, to educate their members about their rights.

Conclusion

By the twenty-first century, HERE consisted of immigrant workers taking the lead in revitalizing the labor movement. HERE collaborated closely with the ILGWU, now UNITE, as sister unions to coordinate efforts; the two unions made plans to merge in 2004. HERE recognized the need to make organizing a priority, to build on the untapped reservoir of immigrant workers, and to ensure that workers were involved in the building of their union. HERE not only organized immigrant workers, but also set examples in their strategy and tactics for all organizing campaigns to fight for a quality life for all working people.

Wildcat Strikes

A "wildcat" action is a strike waged by workers without the instruction or endorsement of union leadership. A possible origin for the term is the word "wildcatter," used to describe nineteenth-century oil drillers who went out on their own, without company knowledge, to dig for oil. The exact definition leaves room for interpretation; the term also sometimes applies to any strike that is illegal, goes against a union contract, or is aimed at eliciting responses from a union rather than an employer.

During wartime, "no-strike pledges" made work stoppages illegal in many industries. Strikes waged by auto workers, machinists, or other necessary wartime labor during that era were called "outlaw strikes" in that they defied both the law and the official union position. Very little academic attention has been devoted to the examination of wildcat strikes. Although much has been written on the story of individual wildcat actions, less has been studied about the plant and workplace conditions, worker grievances, and the national labor climate that generally instigated and fostered such "outlaw" strikes.

Workers often organize wildcats on short notice to protest an official union decision not to strike, or in response to disciplinary actions taken against a fellow worker or group of workers. Wildcats illuminate the limitations and challenges of unionism—particularly in the presence of racism and corruption—and under the pressures of capitalism. As a strike against the concessions of official union leadership or a strike in the absence of official union endorsement, the wildcat marks the point at which a labor union fails to serve its membership.

The line between official and unofficial (wildcat) strikes is often blurred by both the dynamic nature of labor unrest and the complex power relationship between union leaders, management, and workers. Sometimes a formal union-sanctioned strike will spin out of the union officials' control, perhaps as a result of union concessions or the failure of union leadership to recognize the demands of the rank-and-file. In such cases, an official strike could become a wildcat when workers ignore union officials' orders to end the strike and return to work. Another form of ambiguity comes from a phenomenon called the "pseudo-wildcat" in which the union leadership maintains concealed influence in orchestrating a strike that masquerades as an act of defiance against the union. Union officials may also be quick to assert that all strikes—even those planned and led by union officials—are "spontaneous" or "unsanctioned" in order to absolve themselves of responsibility in the eyes of management.

Motivations

Historically, wildcat strikes are seldom motivated strictly by wage demands, but rather by rank-and-file discontent with official union negotiations or settlements. Another common motivation is the disciplinary repercussions of work actions. Some labor historians blame poor economic times for upsurges in wildcat strikes, arguing that when the economy is bad, unions are forced to accept wage cuts and other concessions that anger union members and eat away at rank-and-file support for union leadership.

During World War II, labor unions agreed to a "no-strike pledge" in support of the war effort, effectively making any strike a wildcat. Nonetheless, workers waged unofficial strikes throughout the war to protest frustrating bureaucratic delays caused by the newly established War Labor Board (WLB, now the National Labor Relations Association—NLRA), which oversaw all labor grievances and disputes. Under WLB procedures, even the gains that unions had already won through negotiations, such as back pay, could take more than six weeks to reach the pockets of frustrated workers. In such cases, a wildcat strike often came before the rulings made their way through the bureaucratic WLB process. Many workers staged

wildcats in protest of WLB rulings. Neither the Board nor the courts tended to be favorable to workers, the courts often ordering strikers to "go to work or go to jail," as in the case of a 1969 miner's strike in West Virginia, which sought to call company attention to high rates of black lung disease.

One frequent cause of wildcat strikes is union and company reaction to other wildcats; for this reason, they tend to reproduce themselves. For example, a drill press operator might walk off the job in protest of dangerous and destructive speedups, and subsequently be disciplined by the company in the form of a dismissal or a dock in pay. In response, a wildcat strike might ensue, and the company might respond by firing those who led that unsanctioned walkout. If the union does not demonstrate its loyalty to workers by responding with criticism of the company's actions, workers might stage another wildcat strike in protest of their union officials' failure to act. At each step, the number of workers involved tends to increase dramatically.

Wildcat Trends and the Changing Workplace

A company's productivity is ultimately beneficial to the worker, so union leaders must work with both management and rank-and-file to achieve it. However, in that negotiation process unions risk losing the support of workers when concessions such as wage cuts, loss of benefits, speedups, and mandatory overtime become "necessary," either for union-management politics or for company survival. Often employees perceive such concessions as indicative of union leadership loyalty to management rather than to the worker. The result is often worker discontent, loss of faith in the union leadership, and, ultimately, unsanctioned job actions ranging from slowdowns and small acts of sabotage to massive wildcat strikes.

Until the late 1950s, wildcat strikes were even more common than official, union-sanctioned strikes in many industries. Before that time, workers in any given plant did very different kinds of work under one roof and one body of management. It was difficult for the particular grievance of one worker to get the support and backing of a union that was responsible to a very large and diverse group of employees. As a result, most work stoppages during this period were orchestrated on a small scale and were organized by occupation without the consent of the union leadership.

By 1959, changes in the organization of industry and the workplace created a work environment in which similar kinds of workers did similar kinds of work under one roof. One union represented these occupationally organized workers, making it easier to get union support for strikes. Consequently, more union-sanctioned strikes occurred, while the number of wildcat strikes decreased. However, unsanctioned strikes continued to flare up when workers became frustrated or impatient with either their union leadership or the bureaucracies that delayed strike authorization.

Labor historians are often skeptical about government statistics on strikes—and on wildcat strikes in particular—because they rarely reflect the frequency or severity of job actions. Sources like newspaper coverage fail to register less obvious or publicly visible acts of worker resistance waged in the absence of union consent, such as slowdowns, group "sick days," sabotage, unofficial and clandestine "parties" on company time in company facilities, and worker redistribution of labor. Many wildcat strikes, according to one historical account, are "nothing but group absenteeism." In both government records and media representations, such collective and complicated acts of resistance often fail to register.

Historical Perspective

Although wildcat strikes have always had a consistent presence in the labor movement, three particular periods in U.S. history have seen a high occurrence of unofficial strikes. In 1919, a wave of wartime wildcats struck the railroads and coal mines. During World War II, a second intense wave of defense–industry wildcats responded to "no-strike" pledges, mandatory overtime, speedups, and increased bureaucratization of labor grievance procedures. Finally, in the 1960s and 1970s, an increasingly diverse and divided workforce waged wildcats against employers and a union leadership that seemed increasingly alienated from its rank-and-file and increasingly allied with management. Wildcat strikes returned to the coal mines in 1969. Cargo, correspondence, and packages across the country sat idle that same year while both U.S. postal workers and the Teamsters waged wildcats.

Wildcats of World War I: Railroads and Coal Mines

An 1894 strike by the American Railway Union (ARU) demonstrated the extent to which railroad employees could control the fate of American commerce. The

Pullman strike, named after the Pullman Palace Car Company and the Illinois company town it controlled, ended only with the full force of the U.S. Army. In the years that followed, government intervention in the railroad industry intensified. By 1920, the rails remained under government control, and the right to strike remained suspended.

Between 1914 and 1920, consumer prices rose 100 percent in the United States, while railroad worker wages increased by only 50 percent. Without the right to strike, this caused highly combustible discontent among railroad employees. When a Chicago Yardsmen Association leader was demoted in April of 1920, 700 switchmen on his line—already angry about their lack of power and diminished economic viability—needed little more incentive to walk off the job. Within a few days, every Chicago rail line had become involved in the wildcat strike that ultimately brought 9,000 switchmen to picket lines across the country.

Within a few more days, the strike had spread to engineers, firemen, and conductors from coast to coast. So had the union's anti-wildcat drive. Railway union leaders claimed that the strike violated union rules and contracts; in fact, there actually was no contract that spring because the railroads had just recently been released from government control. Nonetheless, union leaders and railroad management accused strikers of being "Bolsheviks" and threatened them with termination. Tens of thousands did lose their jobs and were replaced by strikebreakers brought in by the union leadership.

To mount this offense against their employers, their government, and their own union leadership, striking workers formed what labor historian Jeremy Brecher calls temporary "outlaw" organizations, such as the United Railway Workers of America. Throughout the month of April, newspaper headlines reported raids and arrests at these "outlaw" meetings throughout the country. Ultimately, it was the arrest of more than twenty strike leaders for violation of the Lever and Sherman Acts that put an end to the strike. Weakened wildcat leadership could not sustain the struggle in the face of the newly established Railroad Labor Board, appointed by President Woodrow Wilson in response to the work stoppage. The board asserted the authority of the official union leadership and refused to acknowledge the demands of "outlaw" groups, but it did negotiate a wage increase for all railroad employees that summer.

Meanwhile, wildcats in the coal mines demonstrated how organized worker actions opposing their own union leadership can extend beyond mobilizing a work stoppage or walkout to creating an alternative union platform. During the week of July 4, 1919, as many outlaw railroad strikers returned to the job, workers throughout the country struck to protest the imprisonment of Socialist Party leader and railroad union organizer Tom Mooney on implications in a 1916 bombing at a rally in San Francisco.

Like workers in other industries and regions, coal miners in the Belleville subdistrict of Illinois had their pay docked for taking part in that strike, which was itself illegal. Miners at Nigger Hollow Mine No. 2 called a "spontaneous mass meeting" after protesting fruitlessly to management about their loss of pay. They drew up a petition asking the union chairman to call an official union meeting on the topic. When that petition was ignored, the miners selected their own chairman and held their own meeting, at which they voted that the collection of fines was illegal. They also voted for a work stoppage and sent word to the miners at a nearby mine to join in their strike. That same night, at a joint meeting of the strikers from both mines, a union official showed up and demanded that the miners return to work. The official was promptly booed and ejected from the meeting, and soon word had spread throughout the region.

Effectively, these wildcat strikers had rejected their official union leadership and had reformed their goals, grievances, and strategies with leaders from among their own ranks. Contradicting the common perception of wildcats as unplanned, disorganized, and caustic, these miners drafted statements in which they called their union leaders "apologists" and criticized the "futility" of reforms such as wage increases and shorter working days. The Bellville miners sent delegates to other mines in the region to increase their numbers. Not only did they petition the union for a state convention, but they also planned their *own*, which was, in effect, a wildcat convention.

Meanwhile, the UMW hired strikebreakers to suppress (and often harass) their own members. With the union dues paid by the striking miners, union leaders hired some of their own men as "deputy sheriffs," who then arrested wildcat strikers. Ultimately, the union spent $27,000 to repress their own membership. Their strikebreaking efforts only further alienated rank-and-file workers and brought more miners to the picket line. President Wilson criticized the strike and sent federal troops into the mines. On November 8, more than four months after the start of the strike, federal courts ordered the workers to return to the mines. While acting UMW president John L. Lewis declared, "We are Americans, we cannot fight our

government," the strikers proved him wrong and ignored the court order.

For another month—as the weather grew cold and the demand for coal became more urgent—the miners continued their strike, and coal rations grew increasingly severe. Schools closed for lack of heat. The railroads scaled back, and factories fell quiet. Federal troops drove scabs past the picket lines into Montana coal mines. In North Dakota, the governor declared martial law. What began as clandestine meetings of a few workers in an Illinois mine had, in a matter of months, left the entire nation out in the cold. After President Wilson proposed a 14 percent wage increase and an arbitration commission, many went back to work, but not for long. With miners dissatisfied with results, the summer of 1920 was also fraught with coal-mine wildcats.

Wildcats of World War II

Throughout World War II, consistent government and industry efforts to silence labor and increase production in the name of the war effort led to frequent labor unrest. In March of 1941, President Franklin D. Roosevelt created the National Defense Mediation Board to keep labor disputes from interfering with war production, and across the country, union leaders signed "no strike pledges." Nonetheless, by April of that year, wildcat strikes began to flare up in defense-related workplaces across the country.

War demands sped up production, forcing workers to put in more hours at a faster work pace. In September 1942, in response to a war economy, Congress froze wages with passage of the Stabilization Act. Union recruitment grew increasingly difficult as workers began to see the unions—stripped of the right to strike and weak in numbers—as powerless against management. In response to this problem, the passage of "maintenance of membership" provisions automatically signed up new employees and prohibited the termination of union membership during the duration of a contract. Unions relied on this provision to protect their numbers, and it was common for management to threaten its revocation to strong-arm union officials into making concessions. This forced unions into closer alliances with management in order to protect the provision, which contributed to a growing sense of abandonment among rank-and-file workers.

Expanding bureaucracies made this a frustrating time for both union leadership and rank-and-file members. Throughout the war, augmenting this rank-and-file distrust of union leadership was the sense that management and union leadership often used the existence of the War Labor Board to avoid dealing with grievances. Claims sent to the government agency were subjected to great delays and considerable dilution. All labor grievances had to go through the War Labor Board, and they often took years to process. The result was many unsanctioned work stoppages in protest of both specific grievances and the slow, unresponsive manner by which they were processed. These wildcats, often called "quickies" because of the speed with which they were organized and executed, reflected increasing worker frustration with wartime labor bureaucracies and unresponsive unions. For many skilled workers putting in seventy to eighty hours a week, these strikes were also much-needed breaks in the grueling work routine. Sympathy strikes—those in which workers in one plant or department walk out in support of other striking workers—were very common during the war.

During the World War II era, wildcat strikes became part of the initiation into the work culture for a new generation of industrial workers. Contrary to the perception that the high number of World War II-era wildcats was a result of a young, unruly workforce, long-time employees encouraged many new workers to defy the unreasonably high production rates that wartime industry demanded. These "old timers," as one labor study called them, would lead new, younger workers in organizing defiance of both management and the union.

Although the 1940s were frustrating for many workers, they were also—for those who were skilled, white, and male—a period of unprecedented labor strength. A wartime labor shortage gave workers leverage, often allowing them to demand higher wages and to pick and choose among jobs and plants. This was not the case for African-American workers, who continued to face job discrimination and unequal wages when working alongside white laborers in the same job. The wartime era also brought with it a new awareness of discriminatory practices and job inequalities as a result of this more diverse workforce.

Workplace diversity brought racial unrest, and many of the era's most severe wildcats—like those of a generation later—were racially motivated. During World War II, 80 percent of black workers were not unionized, either because they were excluded by racist union members and leadership or because, perceiving unions to be part of a white America fraught with racial hostility, they doubted a union would fairly represent their interests. Black workers often waged wildcats in response to wartime hate strikes in

which white workers walked off the job to protest having to work alongside black workers. Black workers also often staged wildcats to protest union or management acts of racism.

In 1944, nearly 5,000 recorded "quickies" nationwide baffled management and union leadership and resulted in massive losses of man-hours. Each of these five-to-six-day wildcat strikes played its part in forcing improvements in industrial working conditions. Government reactions to wildcat strikes provide much fodder for the image of labor conflict as armed, militaristic, and disorderly. Uniformed military officers were a common sight at war production plants during the wildcat year of 1944, but not for the purpose of controlling unruly strikers. The military presence was often to ensure that employees returned to work and stayed on the job. Soldiers also served as armed escorts for strikebreakers and sometimes even took the place of striking workers so that production could continue.

In determining the effectiveness of wartime wildcats, it is important to note that during the wildcat year of 1944, "labor efficiency" was down by anywhere from 20 to 50 percent, depending on the industry and workplace in question. If labor's aim in mounting a strike is to withhold valuable services from management, then this drop in efficiency indicates a labor victory.

Auto Workers, Teamsters, and Postal Workers in the 1960s and 1970s

If 1944 was the year known for wartime wildcat strikes, then Detroit was the place. As the heart of the auto industry and a wartime destination for large numbers of black migrants from the south, it became the center of the United Auto Workers (UAW) labor conflicts—from hate strikes to wildcats—each of which took on complex and intense racial and class dimensions. This was also true a generation later, in 1973, which one historian of Detroit's labor history called "Wildcat Summer."

For Detroit workers, the second half of the 1960s brought a steady decline in the real income of industrial workers. At the dawn of the 1970s, the U.S. Department of Housing and Urban Development reported that only half of these workers could afford a "decent home." For auto workers in Detroit, a growing number of whom were African American, the UAW's tendency to ally itself with management left employees struggling for a voice in the plant to win improvements in working and living conditions. As production sped up, management at the General Motors plant forced workers to put in overtime by depressing wages. Speedups led to unsafe working conditions, and accidents became more frequent and more severe.

In order to get the attention and support of its own union, Detroit's black workforce waged one wildcat strike after another, in forms ranging from highly publicized work stoppages to more subtle and covert forms of resistance like sabotage, group sick days, and slowdowns. This wave of wildcats in Detroit grew both into and out of a revolutionary social movement based at the Dodge plant known as the Dodge Revolutionary Union Movement (DRUM); this movement organized outside the plants, advocating mass political education through its publications and demonstrations. As historians Dan Georgakas and Marvin Surkin point out in *Detroit, I Do Mind Dying: A Study in Urban Revolution* (1998), the media's emphasis on the role of this revolutionary movement ultimately distracted from working conditions and striker demands.

Wildcat strikers of the 1960s and 1970s, whether they were postal workers in New York, coal miners in West Virginia, auto workers in Detroit, or Teamsters in Illinois, were often portrayed negatively in the media. The mass-produced image of disorderly renegades resorting to warlike tactics is best exemplified by coverage of the 1970 Teamsters' wildcat. During that conflict, Ohio's governor called in more than 4,000 national guardsmen and ordered another 13,000 to remain on "standby" while "open warfare" took place on Ohio highways. The 145th Infantry, which had gained notoriety in the last few years by its responses to urban riots, descended upon West Akron. Meanwhile, police officers staked out known Teamster bars waiting for the rebels to emerge.

The Teamster wildcat began following the settlement of a national contract that offered drivers a raise of $1.10 over a period of thirty-nine months. Outraged, drivers in sixteen cities halted their vehicles and launched mobile wildcat pickets. Companies tried to reroute drivers, but their attempts to avoid the pickets only resulted in widespread violence and the loss of a half-million jobs. Eventually, the teamsters' resilience won them a two-thirds raise and elimination of the unsatisfactory contract.

Postal workers demonstrated that same resolve in their own 1970 strike, which became the first nationwide strike of government employees and ultimately forced President Richard Nixon to declare a national emergency. After 200,000 postal workers in fifteen

states walked off the job, the president sent 25,000 troops to post offices across the country, proclaiming, "the mails must go through!" On St. Patrick's Day of 1970, 25,000 postal workers honored a picket line in New York City, even though striking was a felony offense for government employees, carrying a penalty of a year and a day in prison, along with a $1,000 fine.

Such fines would have been particularly difficult for New York City postal employees to pay, according to a 1968 government study showing that many of the city's postal employees were forced onto public assistance to make ends meet. The study uncovered mass discontent among U.S. Postal Service employees in New York, citing poor working conditions, high cost of living, and limited job mobility. "Sick-outs" among postal workers had been fairly common since 1967, but it was ultimately their 1970 wildcat that brought the country's circulatory system to a halt. Soldiers sent in as scabs to push the mail through expressed solidarity with the strikers by deliberately creating even more chaos behind post office walls. Ultimately, the postal workers won wage increases of 6 percent for all government employees, along with an additional 8 percent for themselves.

Examining labor history by emphasizing only official strikes, or by discounting those actions taken by workers against or without the consent of their labor unions, ignores not only a large part of the story, but also a large portion of the actors. Many workers who constitute the "labor" in American labor history were neither recognized nor supported by official unions. Inclusion of wildcat strikes accounts for the hardest-fought labor battles and holds union leadership accountable for its acts of exclusion and omission. Wildcat strikes mark the visible eruptions of the labor fringe, at which the demands of rank-and-file workers oppose the politics (and often the economic realities) of official union negotiations and settlements.

Organized Labor, Consumption, and Boycotts

The relationship between consumption and social and political change has a long history in the United States. Indeed, consumer actions like boycotts date back to the years before the nation was born, to the colonial era. Before the first glimmers of a revolution were at hand, colonial craftsmen persuaded elite and ordinary colonists alike to boycott imported British goods in favor of domestically produced goods. The nonimportation movement, as it was called then, signified the beginning of a long tradition of consumer actions in the United States. Nearly a century later, the labor organizations that developed in the decades after the Civil War sought to revive that history with boycott and label movements of their own.

The connections between consumption and the labor movement have focused on the ability of unions to influence consumers' shopping habits and thus favor union-made goods. Labor activists sought to harness the economic power behind consumption and transform it into a source of political and negotiating strength. Whether through union labels or boycotts of nonunion goods, union leaders hoped that they could convince consumers to choose union-produced goods over nonunion-produced goods and thus gain additional influence and power at the negotiating table. However, the process of convincing consumers to consider labor conditions and issues of solidarity over price was often a difficult one. The most popular consumer actions of the late twentieth century relied on sophisticated advertising appeals to get the message out. But, even then, consumers tended to be fickle and focused on the bottom line; thus, the connection between consumption and the labor movement proved difficult to maintain over long periods of time. Nevertheless, the moments in history in which labor unions did succeed in influencing consumer choice yielded benefits that were profound for organized labor.

The Labor Movement and Consumption Campaigns

The earliest link between consumption and the labor movement dates back to 1875, when members of the Cigar Makers' Association of the Pacific Coast in San Francisco began to consider ways of persuading consumers to choose their cigars over nonunion-made cigars. The union devised a conspicuous white label that would be placed on each box of cigars to help consumers identify the source of manufacture. The label read, "CIGAR MAKERS' ASSOC'N. The cigars contained in this box are made by WHITE MEN." The label's specific and intentional identification of white men as the producers was an important part of the design. For in addition to seeking to increase their power by increasing consumption of union-produced cigars, this first union label also functioned as a tool of racial exclusion.

Chinese and Chinese-American cigar makers posed a threat to white men's control of the cigar industry in San Francisco, and thus the union devised a label to act not only as a tool of solidarity, but also as a way to discredit Chinese laborers. Rather than attempt to include Chinese and Chinese-American workers in their union, white cigar makers used the white label to signify not only a union-made product, but also the racial origins of the product. Cigar makers in other cities soon adopted the label technique for themselves. Four years after the pioneering efforts of the Cigar Makers' Association of the Pacific Coast, cigar workers in St. Louis reported that local manufacturers were "unable to sell cigars without [our] union label." In 1881, the national organization of cigar workers, the Cigar Makers' International Union of America, issued its first union label, bringing the technique to a national audience.

Other trade unions soon followed the cigar workers' lead and developed their own union label campaigns. A few decades later, near the turn of the twentieth century, can makers similarly sought to un-

dercut a group of workers through the use of a union label. This time the excluded workers were women, whom male unionists viewed as a threat because of their apparent willingness to work for lower wages and their perceived weak union loyalty. In addition to the availability of cheaper female laborers, male can makers worried that increasing levels of mechanization in the can-making industry would undermine their hard-won union wages. So, male can makers created a stamp that was placed on the bottom of each can, assuring consumers of the "hand-made" quality and sanitary conditions of each can's production.

Gender and the Union Label

At the same time, the stamp was intended to persuade consumers to pay more for goods in the preferred cans and thus increase the marketability of goods in cans made by men unionists as opposed to those produced by women workers. In addition, the organized can makers wanted consumers to associate good quality with masculine production. In these very early union label campaigns, ethnicity, race, and gender were central issues of union solidarity.

Gender posed an interesting conundrum for the labor movement at the turn of the twentieth century, in terms of both organizing and consumer activism. Women were specifically excluded from the union label strategy in much the same way that they were often excluded from trade unions. Despite the fact that working-class women were typically responsible for determining a great percentage of their family's consumption, one study of the efficacy of the union label strategy in 1910 complained that in order for the label strategy to be successful, the labeled goods needed to be purchased by men consumers.

Women consumers lacked a sense of solidarity and industrial experience and were thus unable to maintain consistent support for union labels, or so the argument went. The reasoning behind working-class women's wavering support for union labels actually had more to do with the reality of small budgets and higher-priced union goods. It was the working-class woman's responsibility to stretch her meager dollars to the maximum, which often meant choosing lower-priced nonunion goods over labeled union goods. The consumer actions favored by trade unionist husbands and leaders often conflicted with women's need to stretch their husband's (and often, their own) working-class wages to meet their family's needs.

Still, not all union label activists dismissed women. As the label technique grew more sophisticated in the early twentieth century, some union leaders eventually turned to women and demanded their support for union labels. They had finally come to understand that women of all economic classes, as the arbiters of household consumption, wielded a substantial amount of power in the marketplace. Seeking to harness that power, many unions and even the American Federation of Labor (AFL) decided to target their union label campaigns at women. In 1909, the AFL established its own Union Label and Service Trades Department. Eventually, organized labor came to realize that the success or failure of the union label strategy depended, in large part, upon the support of women.

Middle-class women reformers in the Progressive Era took the union label technique and made it their own. In 1898, a group of reform-minded activists, most of them women, joined together to harness the power behind consumption as a force for improving working conditions and created the National Consumers League (NCL). The early NCL used the standard techniques established by trade unions to advocate for their goals. For instance, like the cigar makers, the NCL devised a white label to designate goods produced in favorable circumstances. In addition, they developed a "white list" that identified department stores with good working conditions. From the very beginning, women played a central role in supporting such label efforts by labor unions and coalitions of activists working outside the realm of organized labor. The NCL was not, strictly speaking, a division of organized labor; however it was part of a larger movement that sought to improve working conditions, eliminate sweatshops, and create minimum standards in industry. In that way, trade unions and the NCL were working toward the same goals.

As the ready-to-wear apparel industry and its accompanying sweatshops flourished at the turn of the century, organized labor found new uses for the union label strategy. By 1900, the two primary apparel workers' unions, the International Ladies' Garment Workers' Union (ILGWU) and the United Garment Workers (UGW) had developed their own distinctive labels to be sewn into garments produced by union workers. The initial label campaigns of the ILGWU and UGW suffered, however, from spotty regulation. Labels were sometimes granted to substandard shops, even sweatshops and nonunion shops, thus undercutting the efficacy of the strategy.

The onset of World War I in 1914 had the effect of increasing the number of Americans on union rolls as women, African Americans, and even unskilled workers found temporary positions in industries that

had previously spurned them. But immediately after the war's conclusion, the Red Scare swept the nation. Labor unions scrambled to purge radicals from their rolls, and, in the process, the movement became more conservative and less demanding of American business and industry. It was in this environment that organized labor greeted the Great Depression. Some leaders of the AFL supported an extension of the union label strategy to a "Buy American" movement, arguing that consumption of American goods, in addition to union goods, would increase the availability of jobs in the nation. During the Great Depression, the AFL's Union Label Department expanded its endorsement of union goods to include goods made in America by Americans, enveloping its appeals in a patriotic veneer. Union goods were, by definition, American goods, and what was good for organized labor was good for the millions of unemployed Americans. In addition, the AFL could earn some political advantages by appearing as if it was working to solve the Great Depression.

In 1941, America's entry into yet another global conflict once again swelled the membership rosters of labor unions in the United States. Because of the mobilization effort for World War II, both the trade-oriented, conservative AFL and the more progressive Congress of Industrial Organizations (CIO) fared well during the war. The number of unionized workers grew from 10.5 million at the start of the war to 14.7 million by the end of the conflict. After the war, unions turned once again to their label campaigns. By this time, there was a general consensus about the importance of women consumers to the success or failure of label campaigns. This was particularly true in the apparel industry. Apparel was one of the most frequently purchased of union-labeled goods, and the men's clothing workers union, the Amalgamated Clothing Workers of America (ACWA), wasted no time in reviving its label campaign. This time, however, the union directed its appeal to trade unionists as well as to the general public through radio promotions and advertisements in both trade and popular journals. In the 1950s, cities and towns across the nation, even in the notoriously anti-union South, sponsored union label weeks that often included essay contests and raffles of union-made products. Many of the postwar union labels, especially those initiated by the apparel unions, were directed at women consumers. Union label advocates recognized that women purchased not only their own clothing, but also the clothes for their husbands and children.

The post–World War II union label campaigns also employed sophisticated advertising techniques. The ILGWU, for instance, hired a well-known advertising firm to lead its label campaign in 1958. Mary Rockefeller, then the First Lady of New York State, kicked off the campaign by sewing the first ILGWU label onto a garment. A few years later, Eleanor Roosevelt stitched the one billionth label into another union-made garment. Photographs of these two promotional events appeared in union advertisements in women's journals. With the help of such prominent women and sophisticated advertising that targeted women consumers, the union label appeared to have staying power.

"Buy American" Campaigns

The flood of cheaper, imported goods that began in the 1960s with the Kennedy Round of the General Agreement on Tariffs and Trade's (GATT's) massive tariff reductions posed an enormous threat not only to domestic industries like apparel and auto manufacturing, but also to their respective unions. The threat was real and substantial. From the early 1960s to 1976, the percentage of imported apparel in the United States grew from a mere 2.5 percent to over 30 percent. In the 1970s, the ILGWU sought to bring its label campaign to the forefront of the battle against imports. The national offices of the ILGWU worked steadily, often with participation of its sister union, the Amalgamated Clothing and Textile Workers Union (ACTWU; created by a merger of the ACWA and the Textile Workers Union of America in 1976) to enforce label standards and to make the connection between union-made and American-made apparel. Then, in 1975, organized labor's use of the label as a weapon against imports reached its high point. In November of that year, the ILGWU's famous "Look for the Union Label" television commercial first hit the airwaves, bringing the pro-union "Buy American" message into living rooms across the nation. The commercial's catchy jingle, "Look for the union label, when you are buying a coat, dress, or blouse," soon caught on. Within a few months of its initial broadcast, most Americans were familiar with the tune and its pro-union, "Buy American" message. The song's lyrics linked the pro-union agenda with the "Buy American" campaign, claiming that the ILGWU's label was good for America. The AFL championed the commercial's success and its message, calling it the "cry of the modern trade union movement."

The appeal of this particular label campaign extended beyond that of earlier versions. This time, the union's strategy envisioned women as workers,

unionists, and consumers. The mostly female signers in the "Look for the Union Label" commercial were an ethnically and racially diverse group. African-American, Latina, and Asian women all had a prominent place in the commercial, thus broadening its appeal. The success of the commercial is difficult to measure, but without doubt it did succeed in getting the message out. Versions of the commercial appeared on television shows like *Jeopardy* and *The Merv Griffin Show*. The very popular *Saturday Night Live* program even poked fun at the commercial in one of its more memorable skits. It was clear that the commercial succeeded in making consumers aware of the union label. However, it did little in the long run to stem the ever-increasing flood of imported apparel.

Consumer Boycotts

Where the union label campaigns sought to gain influence by urging consumers to spend money on particular goods, boycotts functioned in exactly the opposite way. Boycotts demanded that consumers withhold their money. By not purchasing certain specified products, unions hoped to compel employers to negotiate more fairly over issues such as union recognition, wages, and working conditions. Both boycotts and union labels were strategies designed by organized labor to increase the power and influence of labor unions in America. However, union-sponsored boycotts suffered under much stricter governmental supervision and legislative restrictions than label campaigns.

In the four decades before World War II, the right of organized labor to initiate boycotts was the focus of several court decisions and federal legislation. One of the most famous early boycotts initiated by organized labor in this time period was the subject of the famous 1908 U.S. Supreme Court decision *Loewe v. Lawlor,* or the Danbury Hatters case, as it was more commonly known. After Dietrich Loewe, the company owner, refused to recognize the United Hatters, the union organized a boycott of all scab-manufactured hats. The United Hatters' organizers and rank-and-file unionists attacked any establishment across the nation that sold hats made by Loewe's scab workers. The AFL supported and popularized the boycott when they added Loewe hats to their "Don't Patronize List."

The boycott ran into trouble when the American Anti-Boycott Association (AABA) joined forces with Loewe and filed suit against the hatters. The AABA amassed a powerful lobby of attorneys who argued that boycotts across state lines constituted a violation of the Sherman Anti-Trust Act because, just as certain combinations of employers were illegal because they constituted collusion, so were combinations of workers. The courts agreed and ordered the hatters to pay three times the actual damages sustained by Loewe. Subsequent federal court decisions extended the boycott limitations provided in the Danbury Hatters case, and eventually, virtually all boycotts of retail establishments were prohibited by the federal courts and their broad interpretation of the Sherman Anti-Trust Act. The courts claimed that unions and other combinations of workers had no right to boycott retail establishments because they were secondary to the complaint itself. That is, the stores that sold scab-made products were not, in fact, the subject of the workers' or unions' complaints and therefore should not have to suffer the consequences of a union-organized boycott.

In the 1930s, boycotts enjoyed a reprieve from the limitations that federal courts imposed in previous decades. With the passage of the Norris-LaGuardia Act in 1932, Congress expressly gave unions permission to use the secondary boycott strategy. Three years later, passage of the Wagner Act reinforced a wide range of freedom with respect to secondary boycotts. But the reprieve was to be short-lived, and few unions were willing to venture into the legal quagmire, fearing lawsuits and devastating monetary fines such as the one suffered by the United Hatters as a result of the Danbury Hatters case. The passage of the 1947 Taft-Hartley amendments to the National Labor Relations Act once again banned secondary boycotts in most industries. As a result of the long history of legal restrictions of boycotts, organized labor has used this type of consumer action cautiously and infrequently.

The United Farm Workers

Of the unions that attempted to use the boycott strategy, the United Farm Workers (UFW) was one of the most successful. Under the charismatic leadership of Cesar Chavez in the 1960s and 1970s, the UFW launched and executed several boycotts. The UFW first adopted the boycott strategy in 1965 and targeted wine grapes produced by a large and well-known agricultural corporation. A few years later, the union broadened the target to include all table grapes. Then, in the 1970s, lettuce was added to the list of boycotted agricultural products. The UFW successfully avoided court injunctions by extending their appeals beyond unionists to include the general public. In this way, the boycott was not specifically a union action and therefore not subject to the wide variety of legal re-

Carrying a "Don't Eat Grapes" sign, United Farm Workers leader Cesar Chavez joins a march in Pittsburgh in 1969 urging consumers to boycott grapes. *(AP Wide World Photos)*

strictions. Chavez publicized the plight of the largely Latino farm workers in California. He passionately campaigned for union recognition, better wages, and improved working conditions. Television interviews further illustrated the terrible plight of Latino farm workers. Chavez fought against long hours, terrible pay, anti-union intimidation, and unsafe and unsanitary working conditions. He urged the consuming public, especially housewives, to boycott wine grapes, table grapes, and lettuce until improvements were achieved. The UFW went beyond targeting fellow trade unionists and included religious organizations, student groups, and nonaffiliated consumer organizations in their boycott appeals. Nevertheless, other branches of organized labor threw their support behind the UFW's efforts. For instance, in 1974 a local branch of the Coalition of Labor Union Women organized a picket line in front of a Newark, New Jersey, grocery store in support of a UFW boycott. The national media also paid close attention to the UFW's boycotts. The *New York Times* and the *Wall Street Journal* both chronicled the ongoing struggle in many editions of their newspapers over the years. Eventually, the UFW's boycotts faded from national attention, and by 1978, the union transferred several boycott administrators back to California for union elections and contract negotiations. The transfer of resources signified a measure of success for the UFW, for the union did succeed in gaining several election victories. But the availability of undocumented workers willing to

work for low, nonunion wages and the passage of several laws in Congress allowing companies to hire temporary immigrant workers limited the achievements of the UFW boycotts.

The ACWA also employed the boycott strategy in the 1970s. In March of 1972, twenty-six workers walked off their jobs at the Farah Manufacturing Company in El Paso, Texas. The mostly Latina group of workers initiated the walkout to protest their low wages, lack of job security, and oppressive work environment. Within a month, that strike led the ACWA to begin an impressive national boycott of all Farah's products. The boycott was one of the most successful in the history of the American labor movement as evidenced by its widespread popularity and the attention of the national media. Many observers point to the boycott as the critical factor in the union and workers' victory over Farah. Once again, the ACWA used advertisements that targeted women consumers and included pictures that portrayed the overwhelmingly female strike force in militant and strong stances.

The union solicited support from a wide range of sources. The Catholic Church provided important institutional support for the boycott, allowing union meetings to take place on church property and publicizing the boycott through its own communication network. Politicians, academics, and celebrities joined the Citizens Committee for Justice for Farah Workers and allowed their signatures of support for the boycott to be published in newspapers with national readerships. Although the National Labor Relations Board issued an injunction against union picketing of stores that sold Farah garments, in effect saying that such action constituted a secondary boycott, the boycott continued. Although there is controversy over the lasting effects of the strike and boycott, one thing is certain: the boycott dealt a serious blow to the financial health of the Farah Manufacturing Company and figured prominently in the company's decision to sign a union contract with its workers in 1974.

Exact figures vary, but according to the company's own financial report, Farah suffered an $8.3 million loss for the fiscal year of 1972 alone. As successful as the ACWA's boycott strategy may first appear, the long-term results were quite different. For although the boycott did result in a union contract and numerous NLRB decisions in the workers' and union's favor, the end result was that most of the Farah plants in the United States closed by the 1980s. The Latina workers who had struggled so hard to achieve union recognition and better working conditions ultimately lost their jobs.

Conclusion

Although the labor movement's many attempts to control consumption have yielded a record of both success and failure, the lingering desire to instill a moral dimension in consumers' marketplace choices lingers on the horizon even today. The AFL-CIO continues to publish a list of union products and retailers and to support a widespread "Buy Union" and boycott campaign. Most recently, an antisweatshop movement has captured the attention of a small but vocal minority of college students and has brought new attention to the labor movement. Boycotts and union labels are, in effect, different sides of the same coin. Although one strategy urges consumers to withhold their money, the other encourages them to spend it. Either way, it is a contest over the very significant power of consumption.

Labor Culture

The American labor movement has been strengthened considerably by its multifaceted culture. Strike novels, industrial songs, union banners, picket-line chants, workplace narratives, union-sponsored films, labor plays, and working-class poetry are just a few of the art forms that have been used to promote union causes. Some labor art may not have attracted a wide audience; however, images of labor, workers, and unions in the arts continue to play an important role in the struggle for social change.

The earliest cultural images of the American worker offer an emphasis on the individual worker rather than the collective, organized laborer. In the early nineteenth century, depictions of work were often tied to the American work ethic and reflect rural, small-town society dominated by self-employed craftsmen, shopkeepers, professionals, or farmers. Positive images of the worker prevailed as the working class was celebrated as the builders of the nation in poems such as Walt Whitman's "A Song for Occupations" (1855) and Henry Wadsworth Longfellow's "The Village Blacksmith" (1841). Songs were also a popular genre for relating the exploits of heroic workers like Paul Bunyan, the Minnesota logger, Casey Jones, the engineer, and the steel-driving man, John Henry. The song remained a popular form as labor organizations grew in the postbellum period, frequently appearing in political or labor journals that were seeking to rally workers. Reese E. Lewis's "March of the Rolling-Mill Men" was published in the *National Labor Tribune* in 1875:

> Rouse, ye noble sons of Labor,
> And protect your country's honor
> Who with bone and brain and fibre
> Make the nation's wealth.
> Lusty lads, with souls of fire
> Gallant sons of noble sire,
> Lend your voice and raise your banner
> Battle for the right.

The use of music to promote the cause of labor would continue as activist songwriters put pen to paper to address issues of working conditions, fair wages, and employment security. A popular song of the 1870s was Felix O'Hare's "The Shoofly." The tune was written in response to the closing of a Pennsylvania coal mine and is just one of many union songs and legends compiled by George Korson. The genre probably reached its height in the early twentieth century with the Industrial Workers of the World (IWW). Described as the "singingest union" America ever had, the IWW would hand with every union card a copy of a book, *IWW Songs: To Fan the Flames of Discontent* (also known as the *Little Red Songbook)*. The tunes in the *Songbook* were often parodies of well-known hymns and popular songs, and the music would ring out at union meetings, on the picket lines, and in jails. Some of the most popular selections, like "The Preacher and the Slave," "Casey Jones, the Union Scab," and "Pie in the Sky," were written by the nation's first well-known labor troubadour—Joe Hill (1879–1915). In the same year that Hill was executed in Utah on questionable murder charges, another IWW poet and artist, Ralph H. Chaplin (1887–1961), penned what has been considered labor's national anthem. "Solidarity Forever," which is sung to the melody of "The Battle Hymn of the Republic," can still be heard in union halls today:

> When the Union's inspiration through the workers' blood shall run,
> There can be no power greater anywhere beneath the sun.
> Yet what force on earth is weaker than the feeble strength of one?
> But the union makes us strong.

Solidarity forever! Solidarity forever!
Solidarity forever! For the union makes us strong.

When the Great Depression prompted labor militancy, musicians like Woody Guthrie, Huddie Ledbetter (Leadbelly), and Aunt Molly Jackson were ready to continue the tradition established by Hill and Chaplin and give voice to the struggles of workers and the unemployed. Aunt Molly Jackson, while expressing the benefits of union representation, also injected a feminist perspective into the struggle in such songs as "I Am a Union Woman":

I am a union woman,
Just as brave as I can be,
I do not like the bosses,
And the bosses don't like me.
Join the CIO, come join the CIO.

Between 1941 and 1942, CIO organizing campaigns were also supported by the Almanac Singers, a group founded by Pete Seeger. Following World War II, People's Songs emerged—an informal group of folk musicians who worked to establish a library of protest songs, many of which could be used by trade unions. Songs that were traditionally utilized by unions played an important role in the protests of the 1960s. "We Shall Not Be Moved," an adapted spiritual that could be heard at civil rights protests and freedom marches in the turbulent decade, was first used in the 1920s by striking African-American textile workers in North Carolina. Similarly, "We Shall Overcome" was originally a Baptist hymn titled "I'll Be All Right" and was developed as a protest song by unionized tobacco workers in the 1940s. Labor has also been addressed by rock and roll artists who have used the guitar to explore their working-class backgrounds.

Members of the Women's Auxiliary Typographical Union proudly display their banners—along with the union label—in New York City on Labor Day, 1909. Since the early 1880s, workers have paraded in Labor Day celebrations to promote unity, build solidarity in the labor movement, and raise public awareness of their contributions to society. *(Library of Congress)*

WOODROW WILSON "WOODY" GUTHRIE (1912–1967)

Woody Guthrie was born on July 14, 1912, in Okemah, Oklahoma. He was the second-born son to Charles and Nora Guthrie. His father was a cowboy, land speculator, and local politician who constantly made and lost money and the family home in the oil booms. His Kansas-born mother profoundly influenced Woody by teaching him songs that he would later adapt. Guthrie learned harmonica as a boy and guitar as an adolescent. The death of his sister in a fire followed by the financial and physical ruin of the family and the institutionalization of his mother around 1923 devastated the young boy's family and home. These incidents helped give Guthrie a uniquely wry and rambling outlook on life. From the age of thirteen, he was an itinerant musician and laborer, and by age twenty-one he wound up in Texas, where he married and started a family.

Unable to find work, Guthrie took to the road during the Great Depression, singing for his meals, and wrote hundreds of songs that praised migrant workers, pacifists, and underdogs of all kinds. He headed west with other migrant workers to California in 1937, where Guthrie experienced the intense hatred and antagonism of resident Californians who were opposed to the influx of outsiders. His identification with outsider status would become a major part of his political and social positioning, one that gradually worked its way into his songwriting. It is especially evident in his Dust Bowl ballads such as "I Ain't Got No Home," "Goin' Down the Road Feelin' Bad," "Talking Dust Bowl Blues," "Tom Joad," and "Hard Travelin'."

Guthrie was always deeply involved in union and left-wing politics, and he wrote many of his over 1,000 published songs on themes of social injustice, poverty, and politics. In 1939, he moved cross-country to New York City, where he befriended such artists as Huddie Ledbetter, Pete Seeger, and Ramblin' Jack Elliott. Together they took up such social causes as union organizing, antifascism, and strengthening the Communist Party, all of which they supported through their political songs of protest. In 1940, folklorist Alan Lomax recorded Guthrie in a series of conversations and songs for the Library of Congress. Also during the 1940s, he recorded extensively for Moses Asch, founder of Folkways Records. The recordings from this period, which have been reissued under the Smithsonian Folkways label, have remained influential for young folk music singers/songwriters everywhere. He published his first novel, *Bound for Glory*, in 1943. A semiautobiographical account of his Dust Bowl years, *Bound for Glory,* generally received critical acclaim. His second marriage to Marjorie Mazia in 1946 produced four children, including son Arlo, who later followed his father into the music business as a singer-songwriter.

Guthrie's best-known songs are "So Long, It's Been Good to Know You" and "This Land Is Your Land," which is actually a Socialist anthem. He helped to form the Almanac Singers in the late 1940s, a group that advocated public power at workers' rallies. Some members of the group would later re-form as the Weavers, the most commercially successful and influential folk music group of the late 1940s and early 1950s. Guthrie's solo and group work exerted a strong influence on younger performers, notably Bob Dylan. In 1952, he was hospitalized with Huntington's chorea, and after fifteen years of suffering, Guthrie died on October 3, 1967. By that time a new generation, including Joan Baez and Dylan, had learned his songs and adopted his causes.

James G. Lewis

Key examples include Bruce Springsteen, who brings union imagery into such songs as "Youngstown" from the album *The Ghost of Tom Joad* (1995). Billy Joel hit the charts in the 1980s when he tackled the deindustrialization of America in the song "Allentown."

In comparison with labor songs, fiction was a less successful genre for promoting the cause of labor. Prior to the Civil War, prose writers did not totally ignore the factory system and working-class life. For example, the textile mills of Lowell, Massachusetts, are addressed in an early strike novel, Day Kellogg Lee's *Merrimack: or Life at the Loom*, and a hint of protest can be found in some of the selections in the *Lowell Offering* written by the young women who labored in the mills. In Elizabeth Turner's "Factory Girl's Reverie," published in the *Offering* in 1845, a sad sense of pastoral longing is offered by a young woman in a noisy factory:

> When the bell calls I must go: and must I always stay here, and spend my days within these pent-up walls, and this ceaseless din my only music?
>
> O that I were a *child* again, and could wander in my little flower garden, and cull its choicest blossoms,

> and while away the hours in that bower, with cousin Rachel. But alas! that dear cousin has long since ceased to pluck the flowers, and they now bloom over her grave.

The novel, however, was not yet the venue for working-class themes since the form often dealt with matters of property and inheritance. Even as industrialization increased in the aftermath of the Civil War, full-scale industrial narratives failed to appear in great numbers. Rebecca Harding Davis set the American precedent for the subject in 1861 when her novella *Life in the Iron Mills* appeared in the *Atlantic Monthly.* Forty years would pass before the appearance of what many consider the next landmark novel of industrialization appeared—Upton Sinclair's *The Jungle* (1906). Within these perimeters, most novels that address factory life handle working-class themes in a subliterary, cursory fashion, reflecting the fact that professional novelists of the time often came out of the upper echelons of society and wrote with middle-class readers in mind.

Gradually, however, more authors would offer treatments of the conditions of the American working-class—Elizabeth Stuart Phelps, Edward Bellamy, Stephen Crane, Theodore Dreiser, Jack London, and Mary Wilkins Freeman. These novelists drew on the major labor struggles of the Gilded Age and Progressive Era to provide insight into the industrial scene and union activity. Works like Theresa Serber Malkiel's *The Diary of a Shirtwaist Striker* (1910), which richly documents the New York Shirtwaist Makers' Strike of 1909–1910, and Ernest Poole's *The Harbor* (1915), a highly successful novel that draws on the Chicago Stockyard Strike of 1904 and the Paterson Silk Strike of 1913 also offered insight into the gains made by the Socialist Party and the IWW during this period.

The Great Depression brought renewed interest in working-class issues and problems, and editors and publishers looked for works dealing with labor struggles. The period witnessed the rise of the worker-writer and the proletarian novel. Novels such as Mary Heaton Vorse's *Strike!* (1930), Grace Lumpkin's *To Make My Bread* (1932), Jack Conroy's *The Disinherited* (1933), John Steinbeck's *In Dubious Battle* (1936), and William Attaway's *Blood on the Forge* (1941) are just a few examples of the successful integration of labor themes into fiction.

In the genre of popular film, organized labor has not fared well. A majority of silent films were highly antilabor, often linking union members and strike leaders as agitators. Films like *Gus—the Anarchist*, *The Dynamiters*, *Murderous Anarchists*, and *Lazy Bill and the Strikers* depicted the strike as a worthless form of protest that only results in death, destruction, and lost jobs. Such films were often supported by employers' associations in their fight against unionization. In 1910, the American Federation of Labor (AFL) addressed the image of unions in films at their convention and passed a resolution encouraging members to protest at theatres where such movies were shown.

The labor union also pressed for the production of "moving pictures depicting the real life and ideology of the working class." Such films would be few in the subsequent decades as Hollywood filmmakers often failed to follow the lead of the proletarian novelist of the 1930s. The film version of John Steinbeck's *The Grapes of Wrath* (1940), for example, offers insight into the struggle of workers but minimizes the political message of the novel. Other noteworthy films provide a hint of the possibility of social progress through organized labor but also show the darker side of corrupt unionism. In *On the Waterfront* (1954), Terry Malloy (played by Marlon Brando) takes a stand against a corrupt, violent, dictatorial labor union; however, he continues to believe in the organization of workers—as long as it is not built on intimidation and fear.

Another film released the same year as *On the Waterfront* is considered one of the finest radical films ever made—*Salt of the Earth*. Director Herbert Biberman, writer Michael Wilson, and producer Paul Jarrico (who were all on Hollywood's blacklist) were inspired by a strike by mostly Mexican-American zinc miners at Silver City, New Mexico, and made the film with the cooperation of the International Union of Mine, Mill, and Smelter Workers. The Mine-Mill trade unionists in the film are portrayed as victims of police who are controlled by the company. An important theme of the film is also sexual repression as the strikers' wives play a pivotal role in the ultimate union victory. The filmmakers overcame a host of obstacles to complete the project—including intimidation from vigilante groups that opposed the production. The director used actual strikers for leading and supporting roles in the movie. Anti-Communists worked hard to suppress the film, and those who did opt to see the movie at the few sites it was shown were greeted by protesters and Federal Bureau of Investigation (FBI) agents. The film, of course, was a financial failure; however, it began to be shown in the late 1960s as interest in radical feature filmmaking intensified, and it now plays an important part in filmmaking classes as well as studies of the blacklist period.

In the decades that followed the production of

Salt of the Earth, pro-labor films would be rare. Director Martin Ritt addressed labor struggles from a working-class perspective in *The Molly Maguires* (1970) and *Norma Rae* (1979). Similarly, writer-director John Sayles tells the story of union organizing in West Virginia coal country in *Matewan* (1987). Sylvester Stallone played a teamster organizer in *F.I.S.T* (1978). *Hoffa* (1992), with Jack Nicholson in the title role, offers a less than positive portrait of union activity.

Labor issues have been more successfully addressed in the genre of documentary filmmaking. Union Films was formed following World War II and produced a series of films in cooperation with the CIO and United Electrical, Radio, and Machine Workers of America. In 1964, the Amalgamated Clothing Workers marked its fiftieth anniversary by producing a film, *The Inheritance*, a history of labor beginning in 1900. The 1970s can be considered a high point in labor documentaries. Barbara Kopple's *Harlan County USA*, dealing with a strike by Kentucky mine workers, captured an Academy Award in 1977. In addition, films like *Union Maids* (1977), *Eugene Debs and the American Movement* (1977), and *The Wobblies* (1979) captured labor's past through extensive use of archival photographs and film.

Theatre has also played a significant role in labor culture. A prime example occurred during the Paterson Silk Strike of 1913 when over 1,000 workers dramatized the labor struggle in the "Pageant of the Paterson Strike" at Madison Square Garden. The pageant successfully gave expression to the struggles of the strikers, but it failed to generate much-needed strike funds. Beginning in the 1920s, workers' education leaders and labor colleges recognized theatre's ability to instruct and inspire. Labor unions like the International Ladies' Garment Workers' Union and Local 65 of the United Wholesale and Warehouse Employees produced their own shows to "entertain" both workers and the public. Labor issues were also the focus of political theatre in the 1960s through 1980s: In Detroit, for example, Unstable Coffeehouse Productions produced *Sitdown '37* for an audience of United Auto Workers to mark the twenty-fifth anniversary of the sit-down strike that unionized General Motors. Emmanuel J. Fried, a former labor organizer with experience with Group Theatre in New York, turned to writing labor plays in the 1960s, including *The Dodo Bird* and *Drop Hammer*. Alternative theatres in most major U.S. cities performed these plays. More recently, two plays by John Schneider, *The Line*, dealing with a strike by Milwaukee area meatpackers, and *Out of the Darkness*, focused on a 1898 woodcutters strike in Oshkosh, were performed by Theatre X in Milwaukee.

Photography has also played a key role in raising awareness of American working conditions. Sweatshop and child labor conditions in New York were captured in the work by Jacob Riis, *How the Other Half Lives: Studies Among the Tenements of New York* (1890). Another example of a photographer who worked to capture working-class people was Lewis Hine, who produced inspiring pictures of workers in Pittsburgh as well as at the construction of the Empire State Building in New York. The 1930s were a particularly strong period for documentary photographs, with many photographers working on projects sponsored by federal agencies such as the Farm Security Administration. Excellent photographs of workers were also produced by members of the radical Film and Photo League, which completed a host of documentary projects during the Great Depression. A noted photographer of anthracite coal miners is George Harvan of Pennsylvania whose pictures have been widely displayed.

A number of organizations, including labor unions and historical societies, have recognized the ability of computer websites to preserve and promote the culture and history of the American labor movement. A large number of sites addressing labor arts is now available online, giving viewers the opportunity to tour labor art exhibitions. Collections include a wide range of buttons, badges, ribbons, cartoon art, murals, photography, songbooks, and sheet music. Some websites examine specific episodes in labor history such as the Haymarket Affair and the Triangle Shirtwaist Factory Fire. Web pages also include audio files of labor songs. Some sites also offer information on labor theatre groups, plays, labor festivals, and public arts projects.

Native American Movement

Page Intentionally Left Blank

Introduction

Most people have come to accept the theory that there were contacts with the so-called New World before 1492. There is evidence of contact with peoples from the South Pacific, North Pacific, Africa, the Mediterranean, as well as other European countries. Recently, some have speculated that China had been a source of exchange. And many are familiar with Leif Eriksson, the Norse explorer who sailed west from Greenland and visited parts of Newfoundland and Nova Scotia. Yet many still choose to date the North American experience from 1492 as if there was nothing—or no one—in this region before the explorer Christopher Columbus came and "discovered" this landmass and claimed it for the Spanish crown.

When Columbus came upon these shores, the first thing he did was rename the islands that he encountered, even when he knew the name given to that place by those who lived there. Of course, in that process of naming was the process of taking possession of the islands—and the native peoples—who lived on them.

While taking possession of the islands and the peoples of the Caribbean, Columbus wrote about the indigenous peoples whom he had encountered: they had no religion, they could not speak, and they were naked (and without shame). He stated that, because of their ignorance of steel weapons, with a hundred men he could conquer them all. It was not long before the Spaniards were doing just that: raping, kidnapping, and pillaging the indigenous communities they encountered.

The Europeans who arrived in North America acted as they did because they had the might to do so, possessing the military technology they needed to impose their will. Moreover, the Europeans believed they had a mandate from God to alter the cultures that they encountered. Thus, armed with steel weapons, the Bible, and an unswerving sense of self-righteousness, the early colonizing Europeans set in place a monumental apparatus of social engineering.

At the very beginning of this massive undertaking, which occurred in the time immediately following Columbus's discovery, the debate in Europe was over whether or not the beings that were encountered in the Americas were actually humans. If they were human beings, then Christian charity demanded that they be treated with respect; conversely, if they were something other than human beings worthy of God's charity, they could be forced under the yolk of European dominance—for the Bible gave man "dominion" over the beasts of the earth. This belief led to a debate in Europe over whether or not the indigenous peoples of the Americas were "naturally inferior" and therefore "naturally" fit for slavery and exploitation by their Spanish "superiors."

One side of the debate argued that the native peoples of the Americas should be treated with respect and Christian charity; the opposing view was that they were fair game for extermination if they refused the "civilizing" influence of the Spanish. Both sides defended the right of the Spanish to convert the peoples of the Western Hemisphere to Christianity and lead them to a more "civilized" life. Unfortunately, the end result of this social debate had little practical effect on colonial depredations. Indeed, in what is today Central America and Mexico, anywhere from 90 to 95 percent of the native population was lost either through disease, maltreatment, suicide, or outright genocide in the century following first contact.

But one should not assume that the native peoples of the Western Hemisphere were defenseless in the face of these depredations. For example, because the Caribbean islanders were in no position to match Columbus militarily, their immediate resistance consisted of what can only be called a rather sophisticated wild goose chase whereby one community would simply tell the Spanish that they were misinformed—the gold they

sought was really not on this island, but if they left and went to some other distant island they were sure to find lots of gold *there*. By reading Columbus's journal of his first trip, you can readily see that this "resistance" was very effective, with Columbus racing from one island to another in search of gold that turned out to be more illusory than real.

Resistance to the Spanish followed them to the mainland as well, as the Aztecs fought a six-month war against Cortez and his native allies. Here the resistance was broken, not so much by the force of arms as by the incredible destruction wrought on the residents of Tenochtitlan, the Aztec capital, by a smallpox epidemic that ravaged the city. In what is now the United States, the Spanish northward advance suffered a serious blow in 1680 when the Pueblo, under their leader Popé, led a resistance that drove the Spanish from their territory. In large part, the Pueblo "revolt" was a response to the Spanish imposition of Christian ritual throughout their "Empire" in the Western Hemisphere.

Of course, many native peoples were reluctant to give up their way of life and the religions of their culture, and realized that the underlying message most often was either to convert or be killed. Thus, the Europeans' religious proselytizing throughout the Western Hemisphere became the biggest experiment in social engineering that the world has ever seen.

Although much of this discussion is focused on the Spanish, other colonizing powers behaved similarly, with one notable North American exception: the French. Early on, the French adopted a more benign attitude toward the native peoples they interacted with, treating them more as equals than as slaves. As a result, the French often intermarried with the indigenous population and adapted themselves to a more thoroughly indigenous lifestyle. In fact, the French/Native American mixing gave rise to an entirely new and unique cultural group called the Métis, whom the Canadian constitution recognizes as "Aboriginal people." Although the French came to dominate this cultural grouping, many Métis arose out of other (non-French) European/Native American mixtures.

After the defeat of the French in 1760, the British sought to impose many restrictions on the native peoples of North America. This led many to resist the new British overlords. One of the most notable and successful of these efforts to reverse the imposition of British cultural values was "Pontiac's Rebellion" in 1763. With the aid of many warriors, Pontiac enlisted the support of Neolin, a Delaware prophet, who called for a return to traditional ways as far removed from the influence of Europeans as was possible. For example, Pontiac and Neolin allowed for the continued use of European firearms in order to reverse the advances of the British.

Following the same principle as Neolin, we see the prophets Tenskwatawa (brother of Tecumseh), Handsome Lake, Wovoka, Smohalla, and many others, all preaching for a return to more traditional ways. These leaders all saw the revitalization of traditional life as a way to preserve their culture and heritage and represented one of the most resilient forms of social resistance to European efforts to "civilize" the native peoples wherever they were encountered. The one constant (as mentioned earlier) that Native Americans resisted was the demand by Europeans that they give up their "pagan" religions and adopt some form of Christianity, all in the name of "civilization." Often, this religious proselytizing came with the additional demands for monogamous marriage, private land ownership, and a settled way of life based on farming (which, of course, meant an abandonment of the hunt).

Indigenous "social movements" should all be examined through a lens of resistance; Native Americans were never passive actors whenever Europeans attempted to impose imperial hegemony over them. Native peoples all over the world have vigorously resisted those who would impose Western culture upon them, while defending their way of life with that same vigor. As the essays in this section unfold, we will see just how deep-seated the resistance to this European compulsion to assimilate the indigenous peoples of the world has been. Quite possibly, this culture clash—the attempts by the Europeans to "civilize" all they meet and the resistance to these attempts—will prove to be *the* dominant "social movement" that has occurred since the late 1400s.

Phil Bellfy

Native American Movement

Colonial Era–1800s

After the first English settlers landed at Jamestown in the seventeenth century, they and other colonists who followed were preoccupied with "civilizing" the indigenous population. In the century that followed, the English, following the example set by the Spanish, assumed the responsibility of reform by imposing Christianity and Western values in an attempt to create a race of "red Christian farmers." After the Revolutionary War, some reformers argued that citizenship in the new nation was an additional requirement for civilization. During the course of these various reform movements, resistance by the native peoples varied. Some Native Americans adopted European lifeways, others rejected them outright, and still others synthesized parts of those lifeways into their own cultures. As a consequence, the lifeways of native peoples in the United States have been severely altered since European contact.

When English colonists referred to efforts to "civilize" natives, they usually meant Christianizing them as well, for most Europeans believed that Christianity was a prerequisite for civilization. Consequently, most of the colonies relied on missionaries to spread the Gospel to the native peoples and bring them into the fold of European society. In the beginning, these missionaries were Puritans (now called Congregationalists), Presbyterians, and Anglicans, though Quakers and Moravians sent out their own missionaries to natives in the eighteenth century. In 1631, John Eliot, a Puritan minister called the Apostle to the Indians, began to found "praying towns" for Native Americans in Massachusetts, arguing that newly converted natives should live separately in godly communities to keep them from falling under the influence of their pagan brothers and sisters. The outbreak of King Philip's War in 1675 effectively ended Eliot's efforts. In 1754, Eleazar Wheelock, an itinerant New England preacher, founded the Moor's Charity School, a coeducational institution that emphasized manual labor as an integral part of native students' instruction and conversion.

For the most part, Eliot, Wheelock, and other missionaries did not believe that native peoples had any religion at all. It is not surprising, then, that some groups chose to ignore the missionaries entirely. As colonization continued, it became harder for natives to stay free from contact with whites, whether through trade, displacement, or war, and native groups began adopting some of the material and intellectual aspects of the white lifestyle, although they still generally resisted religious conversion. Elite members of Native American communities, along with some "mixed-bloods" who were the children of native and white parents, had more contact with colonists and were most receptive to missionaries' conversion efforts.

Using similar religious themes, many of the prophetic movements associated with native wars during the late eighteenth and early nineteenth centuries were actually movements to reform native cultures from within, although these reforms were designed to undo the missionaries' efforts. Pontiac, an Ottawa Indian chief who allied with the French to drive out British colonists squatting on lands belonging to the Ottawa tribe in 1763, acted in accordance with the religious practice preached by the Delaware prophet Neolin. Neolin argued that native peoples were losing their lands and succumbing to alcoholism and disease because they had forsaken the ancient ways given them by the Great Spirit. Only through reforming their lives could Native Americans regain what they had lost. Although most of what Neolin preached grew out of indigenous spiritual traditions, he included the Christian notions of heaven, hell, and a punishing deity in an apparent attempt to appeal to those already under the influence of Christian ideology.

Immediately after the Revolution, the newly

Unita Bailey keeps a lookout over Ute territory in the Wasatch Mountains, 1873. *(Western History Collections, University of Oklahoma)*

formed U.S. government signed a series of treaties with native groups who ceded vast amounts of land to the government in order to feed the land-hunger of colonists. Because many of those treaties had been negotiated with Native Americans who had no authority to do so, some native groups went to war to reclaim their lands. Ironically, some of the leaders of these groups were the same mixed-bloods and elites who were educated by missionaries. For example, Alexander McGillivray, a mixed-blood Creek political leader educated in Charleston, South Carolina, encouraged his people to keep fighting after the Revolution when Georgia expanded onto Creek lands.

In order to end this series of costly frontier wars, Henry Knox, secretary of war under George Washington, suggested that the government return to the British colonial practice of purchasing rather than conquering Native Americans' lands. This tenet was made firm in the Northwest Ordinance of 1787, and it, along with the policy of providing for the "civilization" of native groups in treaties, formed the basis of the U.S. government's Indian policy for many years. For example, in exchange for land cessions, the 1790 treaty with the Creek gave the tribe the animals and tools it needed to become settled agriculturalists. This treaty was also the first to state that a native group was under the "protection" of the government, essentially making Native Americans wards of the state.

This wardship policy expanded under the presidency of Thomas Jefferson. Jefferson and his officials believed that with changes in their environment and proper education, Native Americans could assimilate with whites, become productive citizens, and be convinced to give up tribal lands that, as republican farmers, they no longer needed. Thus, the Jeffersonian presidency saw attempts to reform Native Americans through legislation. The end result of these reforms would not just be civilized native peoples but more land for white settlers. The legislative reforms therefore proved very difficult to force upon the native peoples since the government still assumed that whites should advance at their expense.

These reforms also led to a new round of missionary activity among native peoples. Congregationalists, Presbyterians, Methodists, and Baptists all ministered to various native groups, establishing schools and preaching their own versions of Christianity. Native Americans, as was their reaction previously, did not always respond favorably. Not surprisingly, indigenous revitalization movements emerged in some of the tribes of the Old Northwest under tremendous pressure by settlers. One of the most notable movements was that of the Seneca prophet Handsome Lake, who preached a message of purification and resistance to white influence similar to that of Neolin. His movement also selectively accommodated some white influences, encouraging the adoption of white methods of farming, for example, so that the Seneca could survive in an increasingly white-dominated area.

Other groups, especially those in the Southeast, seemed to at least outwardly accept the "civilization" program imposed by the dominant society. By concentrating their efforts among the elite and mixed-blood members of these groups, missionaries were able to "convert" a significant number of the Cherokee, Choctaw, Chickasaw, Creek, and Seminole to the Christian cause. In fact, they were so successful that these Southeast tribes became known as the "Five Civilized Tribes." In an odd twist of irony, the Cherokee, who were considered the most acculturated of these groups, took the ideology of civilization to its next logical step and adopted their own national con-

stitution in 1827. The document and its assertion that the Cherokee alone had sovereignty over their lands alarmed the Georgia state government, which then extended its own legislative authority over the Cherokee in an attempt to keep the tribe's land open to white settlement.

Consequently, the Cherokee action stood in stark contrast to Georgia law and the federal policy of encouraging land cession to facilitate white expansion. The result of this clash was the passage of the Indian Removal Act, signed into law in 1830 by President Andrew Jackson. The Act provided for the removal of the Five Civilized Tribes from their land in the Southeast to Indian Territory, which encompassed parts of the present states of Arkansas and Kansas and all of Oklahoma.

The debate over the provisions of the Removal Act pitted reformer against reformer and native against native. Many abolitionists, including Lydia Maria Child and Wendell Phillips, spoke out strongly against removal. Congregationalist missionaries Samuel A. Worcester and Elizur Butler went to prison for their efforts to show solidarity with their indigenous constituents. In Native American communities, those who still followed traditional ways staunchly opposed giving up their ancestral lands, while many of the mixed-blood converts came to understand the danger inherent in armed resistance and became advocates of removal. Consequently, removal had proponents and opponents in white and in Native American communities.

The main humanitarian argument espoused by pro-removal reformers was that it would take native peoples away from the influence of "bad" whites who had a tendency to get natives drunk in order to rob them blind. Missionary Isaac McCoy thought of removal as a chance to establish an ideal native Christian community in the West. Some mixed-blood natives, such as Cherokees John Ridge and Elias Boudinot, favored removal because of increasing harassment from local residents and state governments in the Southeast. The removal arguments won the day, and in 1836 the Cherokee were the first to undertake the forced march west along the Trail of Tears. Other tribes east of the Mississippi, from south to north, were also removed.

After removal, the government, still believing that eventually Native Americans would assimilate into the mainstream, continued to funnel aid money through missionary organizations. This government aid was essential to the Native Americans' own survival; consequently, many native tribes reluctantly allowed missionaries to establish religious and educational institutions in their territories. At the same time, they often openly resisted the proselytizing reforms that were an integral part of missionary efforts.

As white settlement spread across the continent in the period between removal and the Civil War, government officials became more interested in finding a permanent solution to the perennial "Indian problem." By the 1850s, commissioners of Indian Affairs such as Luke Lea and George Manypenny were advocating fixed homes for native peoples in the Far West along the lines of a reservation system. The reservation system was presented as a way to protect natives from the ever-present problem of squatters and "bad" whites.

In the two and a half centuries following the arrival of English colonists, the ultimate goal of reformers remained the same: the "civilization" of the indigenous peoples through Christianity and education. After the Revolution, reformers added citizenship in the form of republican land ownership as the third requirement for civilization. The civilization project, however, was always subordinate to white settlers' desire for land. The degree to which native peoples adopted white ways also depended on both the press of white settlement and the ability of the natives to fight it off. Adoption of civilization, however, did not mean that native peoples would likewise subordinate their interests to those of whites. In this way, white reformers' efforts were always doomed to failure.

Native American Movement
World War I to the Indian New Deal

After 1890, with the "settling" of the American frontier, the last of the Native American resisters were sent to prison and the remaining natives were confined to reservations. No longer able to hunt freely and without access to riverbeds, Native Americans witnessed the disintegration of the economic basis of tribal life and became increasingly dependent on the federal government for their subsistence. In the 1880s, reformers were convinced that to solve the "Indian problem," Native Americans must assimilate into the greater society as individual property owners, farmers, laborers, and, above all, English-speaking Christians. Communal lands were broken up, children were sent away to Indian boarding schools, and traditional gender roles were severely threatened. From the Progressive Era to the New Deal era in the mid-1930s, reformers and policymakers continued their efforts to "civilize" Native Americans. During President Franklin D. Roosevelt's administration, federal Indian policy took a drastic turn. Allotment ended, and the segregated boarding schools were closed as revitalization of Indian rights and lands began under the "Indian New Deal."

Americanization and Allotment

Reformers and policymakers from several fronts attacked tribal life. Native cultures were suppressed through legislation and policy forbidding religious ceremonies, dancing, and group feasting. "Americanization" efforts were applied uniformly to all native peoples, with complete disregard for differences in lifestyles and living environments. "Friends of the Indian" advocated dismantling the reservations as the best way to push Native Americans into the modern world where they would learn habits of thrift and industry. In 1887, Congress passed the General Allotment Act, sponsored by Senator Henry Dawes (R-MA), to abolish reservations and allot land to individual American Indians as private property. This new policy terminated communal ownership of land, pushed the native peoples into mainstream society, with the underlying assumption that they wanted and had the capacity to be farmers.

Reservations were surveyed, and tribal rolls were prepared prior to allotment. Those who refused to come in and be listed on the rolls did not receive allotments. Supposedly, listed tribal members were allowed to select their own allotments (160 acres to heads of families, 80 acres to unmarried adults and orphans), but often reservation agents made the selections for them. "Surplus" lands were then sold to anxious settlers and investors, creating a "checkerboard" effect on reservations. Allottees who proved themselves to be "civilized" farmers were to be granted citizenship at the end of a twenty-five-year period, during which time the federal government held title to the land.

Protections provided these native allottees were steadily eroded. In 1902, Congress allowed heirs to sell inherited land without approval from the secretary of interior. In 1906, the Burke Act declared that those American Indians whom the secretary of interior deemed "competent" to manage their own affairs could be granted land patents in fee simple without waiting out the twenty-five-year trust period to sell their allotments. Nationwide competency commissions were especially devastating, easily subject to fraud and manipulation.

On the White Earth reservation in Minnesota, powerful lumber interests bought up timber-rich allotments for a fraction of their value. Senator Moses A. Clapp (R-MN) attached a rider to the annual Indian appropriations bill, which automatically deemed "competent" any "mixed-blood" adult. According to Melissa Meyer in *The White Earth Tragedy: Ethnicity and Dispossession at a Minnesota Anishinaabe Reservation, 1889–1920* (1994), the Clapp rider "brought grief" to White Earth. Speculators hired witnesses to "sub-

scribe to affidavits that the Indian in question had white blood in his veins and in many cases the white blood ran through the branches of the family for many generations to some remote Canadian Frenchman." At White Earth and other allotted reservations, as resources and lands dwindled, social and political conflicts arose. Until allotment officially ended in 1934, over 90 million acres—two-thirds of the Native Americans' land base—were lost.

Assimilation through Education

In addition to breaking up the communal land base through allotment, reformers and policymakers also attacked the family unit by putting children in Indian boarding schools. It was believed that by "civilizing" the children while turning adults into Christian farmers and housewives, the goal of assimilation would be met within a generation. The following excerpt from an *Atlantic Monthly* article entitled, "How Shall the American Savage Be Civilized?" aptly describes society's attitude. "The kind of education they are in need of is one that will habituate them to the customs and advantages of a civilized life . . . and at the same time cause them to look with repugnance on their native state."

First attributed to Captain Richard Henry Pratt, founder of the Carlisle Indian School in Carlisle, Pennsylvania, the phrase, "kill the Indian and save the man," came to represent the philosophy behind the assimilationist movement. Between 1879 and 1902, the federal government opened twenty-five boarding schools for Native American children. Pratt's model of education differed from the existing modes of educating native children in reservation day schools and reservation boarding schools. Children were forbidden to speak their native languages and were immersed into the daily routines of academics combined with training in husbandry and domestic skills. With shortly cropped hair, boys were dressed in military-style uniforms, while girls were forced to wear tight, Victorian-style dresses.

Many students quickly excelled in other areas of the early boarding school curricula such as athletic competitions and debate. The Carlisle bands frequently toured the country. Select students regularly accompanied Pratt to Washington, D.C., where their academic and handcraft achievements were showcased. Although many children were very homesick as well as physically ill from the change in diet and climate, their new common language created the base for the first modern Pan-Indian movement that arose in the second decade of the twentieth century. "Returned students" were usually anomalies on their reservations, often serving as interpreters. Many did take up farming, but the majority worked for the Indian Bureau and became teachers and clerks. The plan for complete assimilation within a generation proved to be a failure.

"Red Progressives" and Citizenship

The circle of college-educated Native Americans in the early twentieth century was small. Several first-generation Indian boarding school students and other educated natives became part of the first modern Pan-Indian movement. In 1911, the Society of American Indians (SAI) was founded. Executive board members were all Native Americans, including Arthur C. Parker (Seneca anthropologist), physicians Charles Eastman (Santee Sioux) and Carlos Montezuma (Yavapai Apache), Angel DeCora (Winnebago), and Arapaho minister, Sherman Coolidge, to name a few. Many of the members' paths crossed through Carlisle at some point in their lives either as students, teachers, or staff members. While leadership was restricted to Native Americans, the bulk of the associate membership was made up of noteworthy reformers, such as Richard Henry Pratt and Fayette McKenzie. McKenzie, professor of sociology at Ohio State University, was instrumental in bringing the group together, providing the initial forums for their meetings.

SAI members were proponents of tribal values as well as advocates of complete assimilation. Their common cause was social progress and a better image for Native Americans across the country. The SAI published the *American Indian Magazine*, a quarterly journal that featured editorials, reports of Indian policy, literature, historical essays, and self-publicity. The SAI represented the first instances of an intellectual, activist movement. Native intellectuals came together for a specific project, to promote their race.

In 1916, the SAI declared "American Indian Day" to be a national holiday. The handbook published for the national event included guidelines for the "second Friday in May for schools, Saturday for field day, and Sunday for Religious Exercises." American Indian Day was endorsed by the Commissioner of Education, governors, historical societies, and patriotic societies.

The Society of American Indians campaigned vigorously for citizenship for Native Americans. They supported the United States in World War I, encouraging enlistment of native men in the armed forces and Red Cross activities for native women. Eventually, disagreements within the leadership over peyote usage on reservations and the degree of involvement

of the Indian Bureau caused factionalism that split the group apart in the early 1920s.

Native Americans in World War I

At a time when few Native Americans held citizenship status, the majority of natives supported the war effort as Americans. Native American men began enlisting in the army a full year before the United States officially entered the war on April 6, 1917. The federal government initiated a nationwide draft registration for Native American males in June 1917. Protests arose on a number of reservations, especially where American Indians were not "citizen Indians," such as the Navajo in Arizona and the Goshutes in Utah. The draft proved unnecessary however, for over 12,000 Native American men enlisted in the U.S. armed forces during the Great War, with 1,000 of them serving in the U.S. Navy. These figures represented approximately 25 percent of the adult male Native American population.

Reformer and expedition photographer Joseph Dixon along with Secretary of the Interior Franklin Lane were proponents of all-native units within the army. They prompted several congressional bills calling for the creation of special American Indian regiments. The Society of American Indians, the Indian Rights Association, and the Commissioner of Indian Affairs, Cato Sells, took stands against segregating native soldiers. Despite the policy of integrating native American men within white regiments, the army inadvertently established a few all-native units.

Although Native American soldiers filled a variety of positions within the army, the majority of men served in infantry combat units in Europe. Their legendary reputation as natural "fighters," combined with popular stereotypes of "instinctive" soldiers, caused hundreds of native soldiers to be assigned as scouts, messengers, and snipers on the front lines. As the war progressed, U.S. military officials began using Native American soldiers to transmit telephone messages in their native languages in attempts to confuse German code breakers. This set an important precedent for the now-famous Navajo "code-talkers" of World War II. Many Native American soldiers won medals for meritorious service and received commendations from their commanders. Native soldiers and those at home hoped the United States would bestow full citizenship upon them as reward for their loyalty. Congress, however, approved application for citizenship only to returning veterans.

Citizenship for Native Americans proved to be a double-edged sword. The U.S. Supreme Court ruled in *United States v. Nice* (1916) that American Indian citizenship was not incompatible with continued federal guardianship. Thus, according to Thomas Britten in *American Indians in World War I: At Home and at War* (1997), "the government could maintain many of its regulations over Indian life." This is exactly what happened with the "competency commissions" set up by Commissioner of Indian Affairs Cato Sells in 1917. Land titles, with patents in fee simple, were issued whether or not native allottees applied for them. Native Americans, unskilled in land transactions and business deals, soon lost their lands and their monies. To Sells and like-minded reformers, this meant reduced appropriations by the government and more independence for native peoples. So while Native Americans were participating wholeheartedly in the war effort, both as soldiers and as home-front supporters, the administration was taking care of its "Indian problem."

War Efforts on the Home Front

Native Americans at home also made significant contributions to the war effort. Native women were among the most important participants in Red Cross activities and fundraising events. Women knitted socks and mufflers, sewed hospital garments, and packaged comfort kits to support American soldiers. Native American women readily embraced these activities as an extension of traditional female roles supporting their warriors in battle. An estimated 10,000 home-front natives joined the Red Cross during World War I. Native American ranchers donated cattle and sheep, while Native American farmers participated in the "Great Plowup," a national campaign to grow more food for the war effort and put more land into agricultural production.

The national media gave much attention to the Native Americans' purchase of Liberty Bonds and war stamps. Numerous articles appeared in *American Indian Magazine*, the quarterly journal of the Society of American Indians, and Indian School publications entitled "Indians Work for Victory Loans" and "Indians Are Aiding Uncle Sam Win War." Cherokee Chief White Elk sold $1.8 million in Liberty Bonds in one week of speaking engagements, as reported in the *New York Times* article, "How Indian Chief Helped Uncle Sam" (January 26, 1919). Secretary Lane took advantage of Native Americans' participation in the war and their purchase of Liberty Bonds. Tribal funds, held in trust by the government, as well as soldiers' paychecks (signed by reservation agents), were being

used to buy Liberty Bonds. When the time came to redeem the funds, in what Thomas Britten calls "classic Indian bureau paternalism," Secretary Lane frequently denied requests because he feared natives would "make poor use of the money" or because "they did not really need [it]." Thus, while Native Americans were "competent" enough to die for their country, sacrifice life savings, and labor for the war effort they were still treated as wards of the federal government.

Reform Efforts in the 1920s

In 1921, Secretary of Interior Albert Fall issued a series of potentially damaging and malevolent proposals. The former senator from New Mexico was well-known as being hostile to Native American rights. The 1922 Bursom Bill, in short, proposed to buy out the federal responsibilities of Pueblo Indians in New Mexico using the tribes' own monies. This and other ruthless proposals affecting Apache allotment, as well as oil and gas leasing, caused heightened concern for Native American affairs, not only within well-established reform groups such as the Indian Rights Association (IRA), but also within a national civic umbrella organization, the General Federation of Women's Clubs (GFWC). These groups worked together in the field on the national level, involved with land issues in New Mexico in 1922 and the Oklahoma Indian guardianship scandals in 1924.

The GFWC sponsored research agents in the early 1920s, who in turn, founded Native American reform organizations of their own. Former social worker John Collier, a GFWC research agent in New Mexico, founded the American Indian Defense Association (AIDA) in 1923. The AIDA was a reform group of non-natives, with several "Red Progressives" on its advisory board. One of these was former SAI member Gertrude Bonnin, who was instrumental in the formation of the GFWC's National Indian Welfare Committee in 1921 and also served as GFWC research agent in Oklahoma in 1923–1924. The AIDA and the IRA also participated in the investigation concerning the Five Civilized Tribes and Osage Indians in Oklahoma. The subsequent report was titled *Oklahoma's Poor Rich Indians: An Orgy of Graft and Exploitation of the Five Civilized Tribes—Legalized Robbery* (1924). Because Bonnin was a native woman, she was able to elicit the stories of not only fraud victims, but also those who feared for their lives—stories that would not be shared with white, male investigators. Bonnin wrote, "[t]he smothered cries of the Indian for rescue from legalized plunder came in a chorus from all parts of eastern Oklahoma." The report, which included exposure of the circumstances surrounding the murder by poison of a young Choctaw girl, Ledcie Stechi, among other atrocities, prompted a full Senate investigation.

Bonnin, along with her husband Captain Raymond T. Bonnin, went on to form the National Council of American Indians (NCAI) in 1926. The council, with its exclusively Native American membership, disbanded in 1938 shortly after Gertrude's death in 1938. The NCAI's mission was to ensure that the reservations be kept up to date on legislative matters concerning native affairs. Whenever the standing Senate and House Committees on Indian affairs were in session, Gertrude was present, listening for her native brethren. She transcribed, typed, and mimeographed periodic newsletters, which she financed with stipends from speaking engagements. These newsletters were always signed, "yours for the Indian cause."

Reform in the 1920s continued with the inauguration of the first national advisory board on Indian affairs in 1923 and the passage of the Indian Citizenship Act in 1924, which allowed American Indians who were not yet citizens to vote in national elections. The Committee of One Hundred, formed by Commissioner of Indian Affairs Hubert Work in 1923, was a select group of prominent citizens, including celebrities, activists, ministers, and anthropologists. Former SAI members, Henry Roe Cloud, Thomas Sloan, Charles Eastman, and Arthur C. Parker, were among the Native American members. Reformers still firmly believed that individual property ownership and Christian-based lifestyles and education were the answer to the "Indian problem." In the 1920s, however, reform efforts began to concentrate on the actual conditions under which native peoples lived and sought some major effort by the federal government to improve the situation. Several reports were written during the 1920s that focused on health, education, and substandard quality of daily life. The most famous report was *The Problem of Indian Administration* (1928), undertaken and published by the Brookings Institution. Commonly known as the Meriam Report, the information contained in over 500 pages finally woke people up to the deplorable living conditions of Native Americans.

Another native-led organization, the Indian Defense League of America (IDLA), had very specific goals, working to ensure border-crossing rights. Former U.S. Army veteran of the Spanish-American War, Clinton Rickard, Tuscarora chief and activist, was opposed to the Citizenship Act because it excluded Ca-

nadian Indians, who had been traveling back and forth across the Canadian-U.S. border all their lives. He founded the Indian Defense League of America (IDLA) in 1926. Rickard and the League lobbied long and hard for border-crossing rights, often traveling to Washington, D.C., to testify before committees at his own expense. Rickard demanded that the Jay Treaty of 1794 and the 1812 Treaty of Ghent, both of which guaranteed border-crossing rights for Canadian and American Indians, be upheld. These rights were achieved on April 2, 1928, when President Calvin Coolidge signed House Resolution 11351 into law. Although considered a "traditional" Native American, Rickard chose to work within the existing federal system on this and other issues affecting Six Nations Indians.

The Indian New Deal

Until 1934, native tribes were rarely consulted on the legislation introduced for their supposed benefit. Commissioner of Indian Affairs John Collier, appointed by President Roosevelt in 1933, was the first Indian commissioner who seemed to listen to Native Americans. The Indian Reorganization Act (IRA), also known as the Wheeler-Howard Act, is one of the most important of any piece of legislation enacted in the twentieth century. Largely the brainchild of Commissioner Collier, the IRA provided, for those 181 tribes that adopted it, an end to the devastating allotment policy and an opportunity to interact within the federal system as native entities. A complete new way of thinking, resulting in legislation that became known as the "Indian New Deal," is reflected in John Collier's own words. In *Indians of the Americas: The Long Hope* (1947), he wrote, "This task of the guardian government, to make free the people who are its dependencies, demands not only sincerity of disinterested purpose but also deep knowledge of what those peoples are, and of the material environment within which they [live]."

Few can deny the positives of cultural regeneration for Native Americans and native land reform. On the other hand, the adoption of constitutionally based governments, which was a provision of the IRA, fractionalized many tribes. Seventy-eight tribes rejected the switch from consensus rule to majority rule. Historian Colin Calloway, in *First Peoples: A Documentary Survey of American Indian History* (1999), wrote, "Indian traditionalists felt strongly against the imposition of rigid and alien political and economic systems on [their] communities." In some regards, the "Indian New Deal" was not new, but merely another paternalistic attempt by non-natives to do what they regarded as the "right thing" for Native Americans. John Collier's twelve-year tenure as commissioner of Indian affairs did chart a new direction in federal Indian policy, but its blueprint for reform, which mandated one policy for all native peoples, offered little recognition of the tremendous diversity within Indian America.

Conclusion

As the survival and practice of native traditions and ceremonies attest, attempts at "cultural genocide" and religious oppression were, at best, only partially successful. Although tribal life was disrupted for a few decades during the allotment and boarding school eras, the resilience of native cultures and spirit is evident in today's world. As reform efforts shifted from the focus of "civilization" and assimilation during the Progressive Era to cultural renewal during the Indian New Deal, policymakers were still doing what they thought was best for Native Americans. It would be several more decades before self-determination was realized by the native peoples and the federal government began to reassess the ward to guardian relationship.

Rise and Repression of the American Indian Movement

In both communities, African-American and American Indian, the civil rights effort produced powerful youth components. Among blacks, the Student Nonviolent Coordinating Committee (SNCC) was most prominent. For Native Americans, it was the National Indian Youth Council (NIYC), a group arising from the so-called Chicago Conference organized at the University of Chicago by Cherokee anthropologist Robert K. Thomas during the summer of 1961. Whereas SNCC harnessed its energies to desegregation campaigns and voter registration drives in the Deep South, NIYC devoted itself to the struggles of the Muckleshoot, Puyallup, Nisqually, and other peoples indigenous to the Pacific Northwest to (re)assert their treaty-guaranteed fishing rights.

In June of 1965, Stokely Carmichael, at the time head of SNCC, announced that the organization was shifting its emphasis from a traditional civil rights agenda to the pursuit of "Black Power." At about the same time, he indicated that SNCC, which had suffered severe repression in the course of its activities in the southern states, was abandoning its philosophical commitment to the ideals of nonviolence. Instead, he advocated the principle of "armed self-defense" practiced by the Louisiana-based Deacons for Defense and Justice and by National Association for the Advancement of Colored People (NAACP) leader Robert Williams in Monroe, South Carolina, during the early years of the decade. Never one to engage in idle chatter, Carmichael immediately set about applying his ideas in Lowndes County, Alabama, reputedly one of the most violently racist locales in the entire South. Within months, he'd succeeded in organizing an area previously believed impossible to approach.

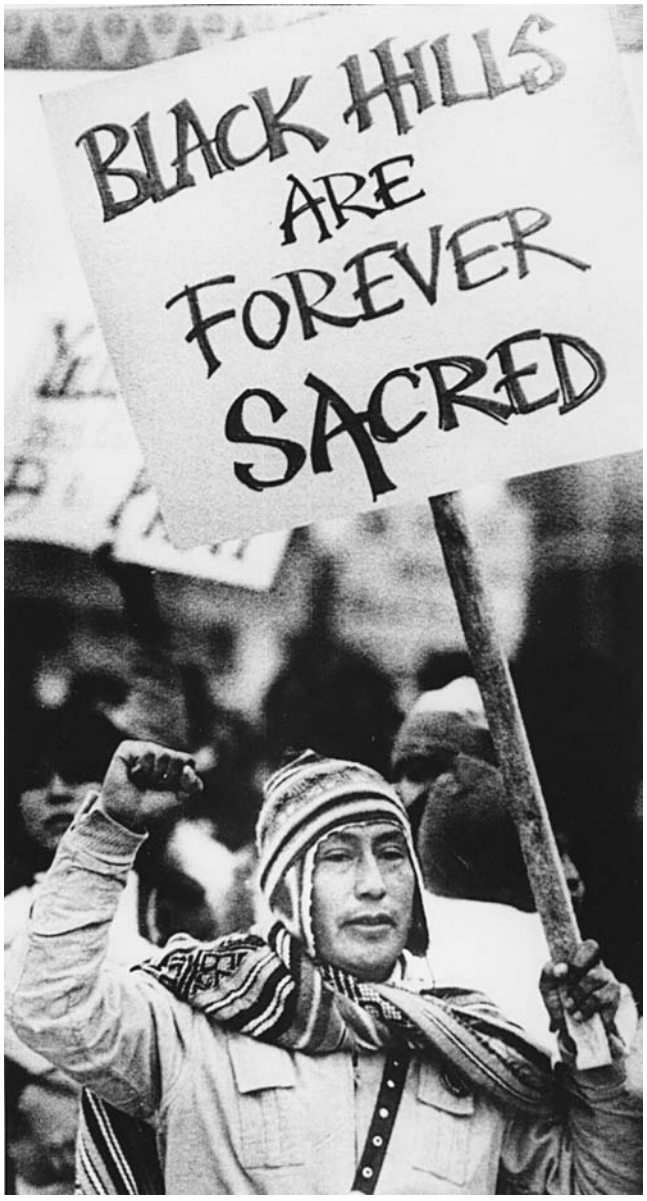
Carmichael's Lowndes County Freedom Organization, as he called it, employed the picture of a black panther as its logo. During the spring of 1966, the image was adopted by a pair of Merritt College students, Huey P. Newton and Bobby Seale, while founding what was originally called the Black Panther Party for Self-Defense in Oakland, California. Built around a ten-point program aimed at securing self-sufficiency and self-determination for North America's "black colony," and the idea that anyone is entitled to meet force with force in defending these rights, the party shortly emerged as the most dynamic black radical organization in the United States, its membership swelling from about a dozen at the outset to more than 5,000 arranged in some forty local chapters just two years later (another 125,000 African Americans indicated "active support" to Gallup pollsters in late 1968). By 1969, Federal Bureau of Investigation (FBI) Director J. Edgar Hoover was describing the Panthers as the most serious of all threats to the stability of America's white supremacist status quo.

The spectacular growth of the Black Panther Party—the "for Self-Defense" phrase was deleted from its name in 1967—heralded a shift in the locus of Black Power politics from the rural South to the urban North, as well as a decisive turn away from Afroamerica's traditional embrace of pacifism as a viable political strategy. At a popular level, this was eloquently symbolized in a series of inner-city revolts marking the "long hot summers" of 1965–1968. In more self-consciously political circles, the same trend was signified by the temporary absorption of SNCC by the Panthers in 1968, and the replacement of the word "Nonviolent" with the word "National" in SNCC's name by H. Rap Brown, Carmichael's successor as the organization's chair, a year later. At another level still, the public resonance achieved by the Panthers signaled a transition from the ideology of Black Power to one demanding the outright liberation of Afroamerica. The latter is most evident in the names of several other African-American organizations making their appearance in the late 1960s and early 1970s: the Revolutionary Action Movement (RAM), for

example, as well as the Republic of New Afrika (RNA) and the Black Liberation Army (BLA).

Corollaries to Stokely Carmichael's Black Power pronouncement in 1965 were being made by Cherokee anthropologist Robert K. Thomas and NIYC head Clyde Warrior, among others, throughout the period. It was not until 1969, however, that National Congress of American Indians (NCAI) director Vine Deloria Jr.'s bestselling "Indian Manifesto," *Custer Died for Your Sins,* put the concept of "Red Power" on the popular radar screen. Fortuitously, the book's release coincided with the seizure of an abandoned federal prison on Alcatraz Island, in San Francisco Bay, by a group calling itself Indians of All Tribes (IAT). Although native people had been pursuing an increasingly confrontational style of politics for some years (e.g., in connection with the fishing rights struggle in Washington State, and with regard to treaty rights in upstate New York), it was the protracted takeover of Alcatraz initiated at decade's end that finally captured substantial public attention.

The momentum was sustained into 1970 by the continued occupation of Alcatraz as well as the release of Deloria's *We Talk, You Listen: New Tribes, New Turf* and Dee Brown's wildly successful "Indian History of the American West," *Bury My Heart at Wounded Knee.* Brown's tract neatly reversed the time-honored polarity of Indians as bad guys/whites as heroes. Hollywood also weighed in with a pair of "revisionist westerns"—Arthur Penn's *Little Big Man* and Ralph Nelson's *Soldier Blue,* which, though intended as analogies to U.S. comportment in the Vietnam War, did much to confirm the accuracy of Brown's historical interpretations in the public mind. Then, in September, a group calling itself the American Indian Movement (AIM) occupied the ground atop George Washington's head at the Mount Rushmore National Monument in South Dakota's Black Hills.



In a rally in Rapid City, South Dakota, a demonstrator raises his fist in support of maintaining the territorial integrity of the Black Hills. *(AP Wide World Photos)*

The American Indian Movement

AIM was founded in Minneapolis during the fall of 1968 by a group of Anishinabe, including Dennis Banks, Mary Jane Wilson, George Mitchell, and Pat Ballanger. Modeled after the Black Panther Party—the Panthers sported black berets, whereas AIM wore red—the new organization gained credibility in its home community in precisely the same manner as the Newton/Seale group had: mounting street patrols to "police the police," who had long and savagely abused the nonwhite residents of America's teeming urban ghettos. Later, AIM would also emulate aspects of the Panthers' broader program, including the establishment of alternative schools, a multimedia news service, legal and health clinics, food give-aways, a housing initiative, and job placement services. Like the Panthers, AIM would eventually, and with limited success, field candidates in local, state, and national elections.

During the occupation of Alcatraz, however, AIM was mostly looking to follow the Panthers' example by extending its reach beyond the Minneapolis/St.

DENNIS BANKS (1932–)

Dennis Banks was born on April 12, 1932, in Leech Lake, Minnesota, as a member of the Anishinabe tribe. Educated in Bureau of Indian Affairs boarding schools, he cofounded, with George Mitchell, the American Indian Movement (AIM) in 1968. Its original purpose was to help Indians in urban ghettos who had been displaced by government programs that effectively forced them from the reservations. Its goals eventually encompassed the entire spectrum of Indian demands—economic independence, revitalization of traditional culture, protection of legal rights, and, most especially, autonomy over tribal areas and the restoration of lands that they believed had been illegally seized.

The movement was involved in the occupation of Alcatraz Island in 1969, as Banks attempted to force the federal government to honor all of the treaties that had been made and subsequently broken with the many American Indian tribes. AIM held Alcatraz for nineteen months. In the early 1970s, Banks became increasingly confrontational after years of frustrations that yielded little action. His 1972 Trail of Broken Treaties March on Washington, and the subsequent occupation of the Bureau of Indian Affairs building for six days, was a precursor to the events that would rock the nation less than a year later.

Under Banks's leadership in 1973, AIM took up arms in resistance. On the Pine Ridge Indian Reservation in South Dakota, AIM took control of Wounded Knee for seventy-one days. The occupation provided an outlet for AIM to publicize its goals of tribal sovereignty and self-determination. Later on that year, after a settlement had been reached, Banks again appeared in Custer, South Dakota, as American Indians held a protest after a jury acquitted a white man convicted of murdering an Indian.

After the protest, Banks was arrested, along with 300 of his fellow protesters. While he was found innocent of charges at Wounded Knee, his involvement at Custer landed him a jail sentence. Refusing to serve time, Banks fled to the underground until then-California governor Jerry Brown granted him asylum the following year. He returned to South Dakota in 1984 to serve eighteen months in prison for his roles in American Indian protests. He was appointed the first American Indian chancellor at Deganawidah-Quetzalcoatl University in 1980, a two-year college in California dedicated to providing alternative ideas and methods of education to Native American people. He has organized several cross-country runs originating from the campus designed to raise awareness of Native American issues. In the 1990s, he remained active in Native American politics but remained out of the national spotlight. During the first half of 1994, Banks organized a five-month Walk for Justice across the United States on behalf of imprisoned native activist Leonard Peltier. He also appeared in a handful of movies in the 1990s, including *The Last of the Mohicans* in 1992.

James G. Lewis

Paul area. Dennis Banks was therefore openly recruiting from the moment he first visited the island in December 1969. His major coup in this respect was his success in bringing into the fold IAT's oratorically gifted spokesperson, a young Santee named John Trudell (now an acclaimed poet) who went on to fulfill the same function for AIM from 1970 to 1979. Also signed up was Russell Means, a reservation-born but urban-raised Oglala Lakota imbued with what many saw as a strong ability to garner the attention of the media. It was Means who conceived of and led the Mount Rushmore occupation during the fall of 1970, as well as a sequel carried out the following June. It was Means, too, who organized AIM's seizure of the *Mayflower* replica anchored at Plymouth, Massachusetts, on Thanksgiving Day, 1971; the ship itself was briefly used as a podium from which a list of Indian grievances was delivered, while Plymouth Rock was painted red.

Simultaneously, other AIM members were busily engineering a series of confrontations and Alcatraz-style occupations designed to attain more concrete goals. The 1971 takeover of unused military facilities at Fort Lawton, near Seattle, for instance, ultimately resulted in the construction, on the site, of an American Indian cultural center. Confrontations in Oklahoma and Minnesota precipitated Indian control over schools in both states. Another confrontation in Denver led to improved healthcare for native people in that city. Under these circumstances, AIM chapters began to sprout up all over North America; by late 1972, the unofficial count was forty-three in the United States and another half-dozen in Canada; a year after that, AIM could boast solid alliances with the Crusade for Justice, a Denver-based radical Chicano organization headed by Rodolfo "Corky" Gonzales, the Los Angeles–based Brown Berets and Chicano Moratorium, Jesse Jackson's Operation Push in Chi-

cago, the Puerto Rican Young Lords Party in New York, and the remnants of the Black Panther Party in Oakland.

This promising "Rainbow Coalition"—the term was coined by Fred Hampton, a Panther leader assassinated by the Chicago police in 1969—also included a hefty Euroamerican constituency, both through the involvement of organizations like Venceremos and Vietnam Veterans Against the War (VVAW), and through Cherokee activist Jimmie Durham's organization of a continentwide galaxy of mostly white Native American Support Committees (NASCs). A genuine international dimension was also added by a relationship with the All-African People's Revolutionary Party (A-APRP), headed by Stokely Carmichael, who by this point was a citizen of Guinea and was known as Kwame Turé.

For all its other successes, however, it was in the small town of Gordon, Nebraska, just south of the Pine Ridge Reservation in western South Dakota, that AIM truly consolidated its reputation among native people as an organization that could get things done. There, one Saturday night in January 1972, a pair of local toughs, Melvin and Leslie Hare, tortured and murdered a middle-aged Oglala named Raymond Yellow Thunder. When local authorities refused to act—as was routine in those days—the victim's family appealed to AIM for help. Russell Means thereupon assembled a caravan of more than a thousand Indians to go to Gordon. At a rally in the town square, he announced that AIM had come to "put Gordon on the map," and, he concluded, "if these two guys aren't charged with murder within 72 hours, we're coming back to take this place *off* the map." In short order, the Hare brothers became the first whites in the history of Nebraska to be prosecuted, convicted, and imprisoned for killing an Indian.

AIM's unprecedented victory in the Yellow Thunder case attracted hundreds of new members, as well as the respect of traditionalists everywhere. The traditionalists in particular had begun to view the movement as a modern warriors' society, dedicated to defending the people's interests regardless of personal risk. For the younger people who flocked to AIM's banner, the movement's aggressively confrontational style of politics, which released Indians from a lifelong sense of disempowerment, was often reason enough to join. Soon, deliberately ostentatious displays of "Indianness"—braids, ribbon shirts, chokers, and the like—had joined bumper-stickers reading "Indian and Proud" as standard fashion statements wherever native people gathered. The "shame of being born into oppression" had definitely been cast off in Indian country.

Among those who had openly embraced AIM by 1972 was Leonard Crow Dog, a staunch Brûlé Lakota traditionalist from the Rosebud Reservation, adjoining Pine Ridge. In reciprocation, the movement anointed him its spiritual leader, with many members participating in his annual Sun Dance, conducted in early August. During an informal meeting convened after completion of the ceremonies that year, it was agreed that AIM had arrived at a point where it might "carry the struggle forward into a new phase." The best way of accomplishing this, it was decided, would be to organize delegations from as many peoples as possible to converge on Washington, D.C., on the eve of the U.S. presidential election, upcoming in November.

The strategy underlying what immediately became known as the "Trail of Broken Treaties" was to use the timing of the event to force Richard M. Nixon—the presidential incumbent, all but certain to win reelection—to publicly acknowledge a range of defects in the country's relations with American In-

On July 30, 1973, members of the American Indian Movement (AIM) gather in a show of solidarity at the Tulsa International Airport, en route to a convention at White Oak, Oklahoma. The emergence of AIM in the 1970s signaled a growing militancy among American Indians. *(AP Wide World Photos)*

dians. From there, it was reasoned that Nixon would have little alternative but to promise correction of the government's long-standing pattern of violating treaties with Indians, usurping their governments, and expropriating their lands and resources. As a result of this treatment, native people had been left by far the most impoverished of any population group reflected in the U.S. census. (Annual per capita income on Pine Ridge was barely $1,200 in 1972, for instance, while unemployment hovered at about 90 percent and male life expectancy averaged only 44.6 years.) "Trail" participants would thus be ideally positioned to submit a twenty-point program through which Nixon could accomplish the desired result during his second term.

Arrangements were made with federal authorities for the planned demonstrations to be conducted in an orderly manner, but officials reneged at the last moment. Permission was even refused for ceremonies to be held at the grave of the hero Ira Hays at Arlington National Cemetery. A Pima, Hays was one of the Marines who had raised the flag on Iwo Jima during World War II. When promised food and housing support also failed to materialize, several hundred infuriated protesters stormed the Bureau of Indian Affairs (BIA) headquarters in the government sector of the Capitol, renaming it the "Native American Embassy," conducting regular press conferences on its steps, and refusing to leave until Nixon personally agreed to a

point-by-point response to the twenty-point program they'd come to present.

Faced with the nightly spectacle of Russell Means appearing as a "noble savage" on the 6 o'clock news, the president not only consented but provided more than $66,000 of his own campaign funds to buy airplane tickets so that those in the BIA building could leave in a hurry. The occupiers then withdrew, taking with them a huge quantity of the Indian Bureau's most confidential paperwork in the process. Over the next several months, the files were copied, the originals returned to the BIA, and duplicates distributed to the various peoples whose assets and affairs they concerned. In some cases, analysis of these papers took years, but among the many revelations they contained, they uncovered the existence of an involuntary sterilization program secretly administered by the BIA's Indian Health Service (IHS). It has been estimated that about 40 percent of all native women of childbearing age were subjected to such treatment between 1970 and 1975. This disclosure caused the IHS to be relocated from the BIA to the Department of Health, Education and Welfare (now the Department of Health and Human Services) in 1976.

The papers also revealed all manner of duplicitous leasing practices and the like with respect to the minerals and other assets "managed in trust" by the BIA under an authority deriving from the "plenary power" over Indians asserted by the United States in 1903. On average, Indians were receiving through BIA-negotiated leases only about 10 percent of the royalties they would have received had they been allowed to sell their resources on the open market. Armed for the first time with the details of how they had been officially defrauded, many of the victimized peoples were eventually able to force changes in the way their lands and other resources were being administered. AIM's forced disclosures also revealed irregularities with regard to the disposition of rents, mineral royalties, and other revenues impounded by the BIA under pre-1972 interpretations of its trust authority and thereafter "lost." At present, an estimated $40 billion or more may have been involved in this "prima facie pattern of official theft."

The Nixon administration, of course, was nonetheless outraged by what had been done, comparing it to Daniel Ellsberg's leaking of the top-secret "Pentagon Papers" to the *New York Times* in 1971. As a result, a smear campaign was launched to discredit the movement and, by extension, whatever information it might seek to convey. Sensational stories quickly surfaced in the press claiming, falsely, that AIM "vandals" had done more physical damage to the Capitol than anyone since the British had sacked the city during the War of 1812. Figureheads from the federally funded National Tribal Chairman's Association were also flown in to denounce Banks, Means and other AIM leaders as irresponsible and independent revolutionaries with no constituency among Indians. Meanwhile, the FBI was instructed to target AIM and to politically neutralize the organization.

Wounded Knee

For their part, most AIM members returned home triumphant, or tried to do so. On Pine Ridge, Russell Means, despite the fact that he was enrolled and owned land there, found himself barred from the reservation by thugs working for the recently installed tribal president, Dick Wilson. Apparently intent upon establishing a "feudal barony" on Pine Ridge and willing to sign away a large and mineral-rich tract of reservation land in exchange for being allowed to do so, Wilson had been provided with federal funds to create a paramilitary entity calling itself first the Tribal Rangers and later the Guardians of the Oglala Nation (GOONs). Heavily overlapping with the local BIA police, the GOONs were employed in an effort to terrorize Wilson's opponents, mostly local AIM supporters, into submission. In response, the opposition organized itself as the Oglala Sioux Civil Rights Organization (OSCRO), headed by Pedro Bissonette, and set about impeaching him.

It was against this backdrop that Dennis Banks issued a call in January 1973 for AIM members to come to Rapid City to undertake a major civil rights campaign in western South Dakota. Barely had they begun to arrive in significant numbers when the news broke that a young Oglala named John Wesley Bad Heart Bull had been stabbed to death in the tiny adjacent town of Buffalo Gap. When, as in the Yellow Thunder case a year earlier, local authorities made no effort to bring appropriate charges against the killer, a non-Indian named Darold Schmidtz, the victim's mother requested assistance from the movement. However, when the resulting AIM contingent arrived in Custer, the county seat where charges against Schmidtz would have to be filed, things were much different than they had been in Gordon the year before.

For starters, an anonymous caller had caused the *Rapid City Journal* to print an announcement that morning, February 6, that the demonstration had been canceled because of bad weather. Hence, only about 200 Indians turned out to participate. They were met

by a combined force of local, county, and state police tactical units, overseen by FBI observers. In the ensuing mêlée, the Custer County Courthouse and the local chamber of commerce building were set ablaze. Most of the Indians, including Means, Banks, and Bad Heart Bull's mother, Sarah, were arrested on charges of riot and arson. The trials would last for years, resulting in convictions of virtually everyone accused. Sarah Bad Heart Bull was sentenced to serve a year in jail, while her son's killer never spent a day behind bars.

AIM had barely managed to bail the last of its members out of jail when word came that the impeachment effort against Wilson on nearby Pine Ridge had been thwarted. Although OSCRO had managed to obtain more signatures calling for his removal from office than had voted for Wilson in the first place, the BIA had placed him in charge of his own impeachment proceedings. A sixty-man Special Operations Group (SOG) of U.S. marshals—essentially a large SWAT unit—had been posted to the reservation to back him up. A day before the impeachment hearing was scheduled to occur, Wilson had instructed his BIA police *cum* GOON units to arrest all tribal council members likely to vote against him and hold them in jail until the proceeding was over. Afterward, he held a press conference at which he proclaimed a reservation-wide ban on political meetings of any sort "until further notice."

Stymied in their efforts to resolve their grievances by conventional due process remedies, the elders comprising the traditional Oglala leadership called upon AIM to intervene. Hence, on February 26, it was decided to convene a press conference the following morning at a symbolic site—the mass grave containing the remains of some 350 Lakotas massacred by the U.S. Army at Wounded Knee Creek in 1890—to expose what was happening on Pine Ridge. That evening, an advance party of about 150 AIM members entered the tiny reservation hamlet to prepare for the event, while a smaller group began to notify the media. At dawn, however, those inside Wounded Knee realized that, overnight, Wilson's GOONs had set up roadblocks on every road by which the press could enter the hamlet, simultaneously sealing the AIM people in. Shortly thereafter, SOG personnel began setting up reinforcing positions. Then, FBI men began to arrive. By the end of the day on February 27, a pair of "consultants"—special warfare experts, actually—had been dispatched to the scene by General Alexander Haig, Richard Nixon's military affairs adviser.

Thus began the seventy-one-day Siege of Wounded Knee, 1973. Initially unprepared for either an armed confrontation or a protracted occupation under South Dakota's severe winter conditions, the surrounded AIM contingent quickly equipped itself with weapons and ammunition from a local trading post and began to jerry-rig defensive emplacements—"bunkers," as they were called—at key points around the "Wounded Knee Perimeter." The expertise provided by several combat veterans among the besieged AIM members was shortly augmented by that of a seven-member, all-white countersniper team sent in as a gesture of solidarity by VVAW. (They stayed for the duration and were naturalized as Oglala citizens by traditional Lakota headman Frank Fools Crow.) A system was also worked out for area supporters to keep those inside Wounded Knee supplied, using the cover of darkness to backpack food and clothing, as well as additional arms and ammunition, through the federal siege lines.

The federal forces also geared up very rapidly. By March 7, nearly 300 marshals and over a hundred FBI agents had been deployed on Pine Ridge. Also on hand were about 250 BIA police officers, most of them SWAT team members imported from other reservations. Wilson's GOONs added another 150 or more, with non-Indian vigilante groups contributing an approximately equal number. State and local police departments in a five-state area surrounding South Dakota were placed on continuous alert to intercept persons suspected of heading for Wounded Knee. (Some 1,200 persons were arrested over a two-month period.) General Haig's on-site consultants, Colonels Volney Warner and Jack Potter, arranged for the provision of equipment ranging from armored personnel carriers (APCs) to M-79 grenade launchers out of restricted military inventories. An elite "rapid deployment force" was pre-positioned at Fort Carson, Colorado, in case an airborne assault of the hamlet was deemed necessary, while planes from Strategic Air Command's Ellsworth Air Force Base, just outside Rapid City, conducted continuous aerial reconnaissance.

Altogether, during the course of the siege, a half-million rounds of military ammunition were fired into the Wounded Knee perimeter, killing two Indians (an Apache, Frank Clearwater, and an Oglala, Buddy Lamont), and wounding numerous others. More flares were used to illuminate the perimeter at night than were expended by all U.S. forces in Vietnam during any year of the war. When this failed to staunch the flow of supplies, authorities resorted to burning off the grass for a half-mile in all directions. Wilson's

In efforts to reach a truce during the bloody siege at Wounded Knee, South Dakota, in 1973, a leader of the American Indian Movement hands a peace pipe to Kent Frizzell (right), assistant United States attorney general. To the left of Frizzell are Wallace Black Elk (kneeling), Russell Means, Dennis Banks (wearing a headband), and Carter Camp (wearing a vest). They are meeting in a teepee. *(AP Wide World Photos)*

GOONs are believed to have murdered as many as thirteen people captured while attempting to slip into the siege zone. In the end, however, even these draconian measures proved fruitless, and the confrontation ended only when federal officials agreed to conduct a full-scale investigation of the Wilson regime and to meet with traditional Oglala leaders concerning U.S. violations of the 1868 Fort Laramie Treaty, which legally defined U.S./Lakota relations.

To be sure, the authorities promptly sandbagged the ceasefire agreement, but AIM's purpose in going to Wounded Knee had been accomplished. By the time the siege ended on May 7, 1973, the situation on Pine Ridge—and conditions in Indian country more generally—had riveted international attention for more than two months. In barely a year, AIM would translate this media attention into establishment of its "diplomatic arm," the International Indian Treaty Council (IITC), directed by NASC's Jimmie Durham and charged with putting the question of indigenous rights before the United Nations. By 1977, IITC would be the world's first Native organization to have attained formal consultative status with the United Nations. In addition, Durham had been instrumental in organizing the so-called Indian Summer in Geneva, a conference that led, in 1982, to establishment of the United Nations Working Group on Indigenous Populations (a subdivision of the UN Economic and Social Council, ECOSOC). The working group itself was charged with providing a regular forum in which violations of native rights could be reported and with drafting a Universal Declaration of Rights of Indigenous Peoples for adoption by the General Assembly. The latter was completed in 1998 and is currently in the process of presubmission review.

In May of 1973, however, all of this lay long in the future. AIM's immediate task was to survive the 185 indictments of its members following in the wake

of Wounded Knee. On this front, Russell Means alone had been charged with thirty-seven felonies and three misdemeanors, and was facing a potential combined sentence of "triple life, plus 199 years," as he put it. Banks and others were in little better shape. The bail set in most instances was extravagant, especially considering that many of the accused were among the poorest people in the country: the amount set to obtain Pedro Bissonette's release was $152,000, for example; that for Means, $150,000; a $35,000 bond was required even to free the medicine man, Leonard Crow Dog. Scores of people languished in jail for weeks, sometimes months, before the funds could be raised to get them out.

The AIM Trials

The first to go to trial were Means and Banks, beginning in February 1974; they were charged with everything from criminal conspiracy and kidnapping to car theft and assaulting federal officers. For this one case, the prosecutors pulled out all the stops in an effort to win convictions; they even used the testimony of an "eyewitness" who had actually been in California when the event in South Dakota had occurred. After an eight-and-a-half month proceeding, however, the judge dismissed all charges with prejudice, observing that "the waters of justice have been polluted" by the introduction of the false witness and other extreme government misconduct. Worse than that, shortly thereafter, it was learned that the FBI had maintained an infiltrator in the defense team throughout the trial.

By the end of 1974, the government had prosecuted forty Wounded Knee cases, obtaining only five minor convictions. Late in the fall, the Wounded Knee Legal Defense/Offense Committee (WKLDOC; pronounced "Wickle-Doc"), an AIM legal defense apparatus created by attorneys Ken Tilson and Beverly Axelrod during the siege, mounted a challenge to the assertion of U.S. jurisdiction over the remainder of the accused as a violation of the 1868 Treaty. In January 1975, Judge Warren Urbom handed down a decision stating to the effect that, while this challenge would once have been true, the United States had so long and so regularly violated the treaty that its legal force had been eroded. On this novel basis, the way was cleared for the trials to continue. At that point, the Justice Department, apparently embarrassed by adverse publicity concerning the meager 7 percent conviction rate it was achieving in return for the expenditure of millions in taxpayer dollars, seems to have decided that the charade had for the most part served its intended purpose. Fifty pending cases were thereupon dismissed.

The remaining twenty "leadership trials" dragged on for another year, however, with the major government "victory" coming in June 1975, when Crow Dog, Oklahoma AIM leader Carter Camp, and Stan Holder, a Wichita combat vet who had served as head of security at Wounded Knee, were convicted of interfering with a group of marshals who had attempted to enter the AIM perimeter on March 11, 1973, disguised as "postal inspectors." All told, after more than sixty trials involving nearly three times that many defendants and literally hundreds of charges put to juries, federal prosecutors could boast of only fifteen guilty verdicts, and none of them for substantial offenses, setting an all-time record low. As it turned out, officials did not seriously expect to obtain better results. Instead, they had pursued a neutralization strategy perfected by the FBI in a 1967 campaign against RAM, making arrests on every possible pretext until the targeted activists were hopelessly mired in judicial proceedings, their organization bankrupted by the demands of bail and legal defense.

Nor did the government's legal offensive end when the Wounded Knee trials had run their course; it simply became more selective. Russell Means, for instance, was confronted with one charge after another for several years and was even tried for murder in 1976, despite the fact that his alleged victim, an Oglala named Martin Montileaux, repeatedly stated before dying that Means had *not* been among his assailants. Although every case ended with his acquittal, the sheer tediousness of it all eventually exhausted Means' patience. His and other AIM members' refusal to rise upon entry of the judge presiding over Sarah Bad Heart Bull's 1974 trial on charges stemming from the Custer Courthouse confrontation led to an all-out courtroom brawl and to Means' only felony conviction a year later. Found guilty of violating a riot clause in an ancient and never-before-used South Dakota antisyndicalism statute, he was sentenced to four years imprisonment (since the law was repealed while Means was in prison, he will forever be the only person thus convicted).

Dennis Banks was convicted of the Custer charges in July 1975 and, facing a fifteen-year sentence, skipped bail, becoming a fugitive. A year later, California governor Jerry Brown, a Democrat, granted him sanctuary in that state, citing a statement by South Dakota attorney general William Janklow that "the way to deal with AIM leaders is to put a bullet between their eyes" as evidence that Banks's life

would be in danger were he to return to Janklow's jurisdiction. (Janklow had also campaigned for his position on a pledge to "put the AIM leaders either in jail or under it.") In 1982, upon the election of Brown's republican successor, George Deukmejian, Banks again went underground, surfacing a few weeks later under another sanctuary arrangement on the Onondaga Reservation in upstate New York. It was not until September 1984, when satisfactory assurances of his safety were made by Janklow (who had been elected governor in the interim), did Banks finally surrender. Sentenced to two concurrent three-year sentences; he served thirteen months.

Meanwhile, in November 1975, during his first stint as a fugitive, Banks, along with his wife, Kamook, and AIM members Kenny Loud Hawk and Russell Redner, were charged with federal explosives and firearms violations. The case was dismissed in 1976 for lack of evidence but was reinstated by the Ninth Circuit Court in March 1980. In 1983, the case was again dismissed, this time on grounds that the government had violated the defendants' right to a speedy trial. But in January 1986, the U.S. Supreme Court again reinstated the charges. In July 1986, the case was again thrown out by an angry district court judge, Andrew Redden, because of "additional due process violations" by federal prosecutors. The Justice Department was seeking reinstatement yet again, when, in late 1988, a weary Dennis Banks accepted a bargain wherein he entered a pro forma guilty plea in exchange for a suspended sentence and the dropping of charges against his codefendants.

Still another exceptionally sordid case concerned Los Angeles AIM members Paul "Skyhorse" Durant and Richard "Mohawk" Billings, accused in 1974 of the ugly torture/murder of a cab driver named George Aird. Although the police arrested the likely culprits within hours of the slaying, and the district attorney's office was preparing charges against them, the FBI apparently convinced them to immunize the accused as state's witnesses and to charge Skyhorse and Mohawk instead. Pretrial maneuvering dragged on interminably, amidst a barrage of anti-AIM publicity and with the defendants denied bail the whole time. When the trial finally began in June 1977—it would last an astonishing eleven months—it soon became obvious that such evidence as existed was either meaningless or crudely fabricated. After one of the state's star witnesses admitted under cross examination that it was he rather than Skyhorse or Mohawk who'd stabbed Aird to death, their acquittal was an all but foregone conclusion. By then, however, they had spent nearly four years of their lives in lock-up, and AIM's reputation in California was irreparably damaged by a raft of news stories comparing AIM to the Manson Family.

WKLDOC attorney William Kunstler concurred, observing that "the purpose of the trials [was] to break the spirit of the American Indian Movement by tying up its leaders and supporters in court and forcing [it] to spend huge amounts of money, time and talent to keep [its] people out of jail, instead of building an organization that can work effectively for the Indian people." The approach, noted Charles Garry, attorney for the Black Panther Party, was identical to that the FBI had adopted in its drive to destroy the political effectiveness of Garry's clients during 1969–1971. The truth of such views was readily borne out during the 1990s, with the release after decades behind bars of one-time high-priority Panthers. In each case, it was conclusively demonstrated that the government had falsified evidence against the victims in precisely the same manner it had done in the Banks/Means, Skyhorse/Mohawk, and other AIM trials.

The Reign of Terror

During the siege, Dick Wilson had openly announced that "AIM will die at Wounded Knee." That venue, despite an official ban placed on media personnel going within fifteen miles of the perimeter, proved entirely too public for the commission of outright mass murder, however. Wilson was therefore deeply, and again quite openly, frustrated with the outcome. So, too, in its much quieter way, was the FBI, a matter clearly expressed in a 1973 internal document entitled "Paramilitary Operations in Indian Country." These sentiments were communicated by manifestations of hostility by both the GOONs and on-site FBI personnel toward the U.S. Marshals Service, which was nominally in charge of the siege and which both Wilson and FBI special operations expert Richard G. Held felt was entirely too "soft" in its handling of the situation.

When the siege ended, however, the marshals were withdrawn, leaving the FBI in charge of law enforcement on Pine Ridge. Even before the marshals departed, the GOONs—whom, after several confrontations, Chief U.S. Marshal Wayne Colburn had come to view as a "menace" and ordered his men to disarm—had begun to turn up with brand-new, fully automatic, army-issue M-16 rifles, state-of-the-art military communications gear, and the like. Years later, Duane Brewer, a prominent GOON leader, would acknowledge that the FBI had been secretly passing along weapons, munitions, and equipment

faster than the marshals could impound it. Once the marshals left, there was nothing at all to disrupt the flow of lethal paraphernalia. The FBI claims it provided such items only to the BIA police, but, as was common knowledge, about two-thirds of the reservation police force doubled as GOONs. The arrangement was quite similar to that prevailing between the FBI and local police *cum* Ku Klux Klan members in the Deep South during the early 1960s.

The result was that during the three years spanning the months March 1973–March 1976, at least sixty-nine AIM members and supporters were murdered on or near Pine Ridge. Calculated against the overall reservation population base of 10,000, the murder rate on Pine Ridge, using *only* documented political deaths, was 170 per 100,000. That is more than *eight times* the 20.2 per 100,000 rate evident in Detroit, the reputed "murder capital of the United States," during the same period.

The grisly particulars attending the Pine Ridge slaughter are often instructive. Among the first fatalities was OSCRO leader Pedro Bissonette, who was shot point-blank in the chest with a 12-gauge shotgun and then left on the road to bleed to death after being stopped at a police roadblock on the night of October 17, 1973. In the predawn hours of March 27, 1975, Bissonette's apolitical sister-in-law, Jeanette, was also—and, at the time, inexplicably—shot to death; according to Brewer, she had been mistaken for Ellen Moves Camp, a prominent Pine Ridge activist. On September 10, 1975, AIM supporter Jim Little was severely beaten by four men; he died during the hour it took for an ambulance to arrive from the BIA hospital, located only two miles away. On January 30, 1976, anti-Wilson attorney Byron DeSersa was shot and left to bleed to death in a ditch. Although numerous witnesses identified the assailants—all known GOONs—FBI personnel on the scene made no arrests, other than that of one of the *witnesses,* an elderly Cheyenne named Guy Dull Knife, who, the agents said, had become "abusive" when they failed to act.

Although the death toll rose at a rate described as "awesome" even by South Dakota's notoriously anti-AIM attorney general, William Janklow, another 340-odd AIM members and supporters on Pine Ridge suffered serious physical assaults and/or attempts on their lives. On the night of March 3, 1975, the home of seventy-year-old Matthew King, an assistant to Chief Fools Crow (and an uncle of Russell Means), was riddled with gunfire by "party or parties unknown." Two nights later, the same culprits burned Fools Crow's own house to the ground. The home of anti-Wilson tribal council member Severt Young Bear was shot up so frequently that he "lost track" of the number of incidents. On June 8, Russell Means himself was shot in the back, the bullet penetrating a kidney, by a BIA police officer who claimed the action was justified because Means was engaged in "rowdy behavior." On November 17, BIA police officer Jesse Stone opened fire on the house of AIM supporter Chester Stone with an M-16, wounding Stone, his wife, and two small children (one of whom, three-year-old Johnny Mousseau, was permanently crippled as a result).

From the outset, AIM and its supporters sought to resolve the conflict by resorting to due process remedies, beginning with OSCRO's effort to impeach Dick Wilson. This was followed by AIM's demand for a criminal investigation of the Wilson regime, advanced as a condition for ending the Wounded Knee standoff. (In 1975, the Government Accounting Office finally completed an audit in which it was concluded that the Wilsonites could not account for more than $300,000 in federal highway funds, but no charges were ever filed.) Then, in the fall of 1974, Russell Means faced off with Wilson in an electoral bid to unseat him. Means outpolled his opponent by a margin of 677 votes to 511 in the primary, but ostensibly lost the runoff by a 200-vote margin. The Denver office of the Justice Department's Civil Rights Division investigated Means's charge that the results were rigged and found evidence of massive fraud—Potato Creek, a district "swept" by Wilson, had forty registered voters but eighty-three ballots cast. Altogether, 154 such "problems" were catalogued, but the results were allowed to stand.

Since many or most of the crimes against AIM and its supporters were committed by the BIA police, no redress could be expected from that quarter. As for the FBI, which exercised preeminent jurisdiction on Pine Ridge during the critical period, George O'Clock, special agent in charge of the Bureau's Rapid City Resident Agency, explained to the press that he was too "short of manpower" to investigate homicides, attempted homicides, assaults, and other acts of political terrorism against AIM. On the other hand, O'Clock—who had at his disposal the greatest ratio of agents to citizens in the history of the FBI—had sufficient manpower available to amass more than 316,000 separate investigative file classifications on the victims. In June 1975, he had even assigned not one but two of his men to track down a seventeen-year-old AIM member named Jimmy Eagle, accused of stealing a pair of used cowboy boots. Given such

priorities, it is unsurprising that the FBI has been "unable" to achieve a satisfactory resolution of *any* of the scores of cases at issue. Many remain "pending" to this day.

In early July 1975, Denver Civil Rights Division investigators William Muldrow and Shirley Hill Witt returned to Pine Ridge for purposes of assessing the reasons for the "ubiquitous climate of violence" there. It was their mutual determination that the Wilson regime, with the complicity of federal authorities, including the FBI, had visited a veritable "reign of terror" upon reservation residents for more than two years. Among other things, they recommended that a planned congressional inquiry concerning the FBI's operations on Pine Ridge, "indefinitely postponed" a few weeks earlier, be immediately resumed. It never has been resumed. In 1987, however, Duane Brewer, still confident that his service as a GOON leader would immunize him and his "boys" from prosecution, confirmed much of what Muldrow, Hill Witt, and AIM itself had suspected. For all practical intents and purposes, the GOONs had functioned as a death squad, coordinated by the FBI in much the same fashion in which the Central Intelligence Agency (CIA) has controlled such entities in Latin America and elsewhere.

Such an arrangement is entirely consistent with the procedures outlined in "Cable Splicer" and "Garden Plot," a pair of "domestic counterinsurgency scenarios" developed by Louis O. Giuffrida, director of the California Civil Disorder Management School, at the behest of then-governor Ronald Reagan in 1970. It is a matter of record that both Giuffrida and British counterinsurgency expert Frank Kitson had briefed Pentagon and FBI officials on the nature of such "low-intensity warfare" strategies as early as 1971 and that one of Giuffrida's ranking staff members, Colonel Vic Jackson, was on-site at Wounded Knee in 1973. It is also telling that, in internal memoranda dating from the crucial period, the FBI referred to AIM members not as "radicals" or "militants"—the traditional vernacular employed by its political neutralization specialists—but rather as "insurgents."

Therefore, it appeared that the FBI was, in a sense, field-testing Giuffrida's scenarios against AIM in the years following Wounded Knee, and that what transpired on Pine Ridge, far from being an example of "law enforcement gone awry," was actually an exercise in outright counterinsurgency warfare conducted by domestic police agencies. To the extent that this is so, the FBI's campaign to neutralize AIM represents a dramatic escalation rather than an abandonment of the already highly illegal counterintelligence operations—known as "COINTELPROs"—that were revealed in the 1975 Senate Select Committee *Report on Intelligence Activities and the Rights of Americans* as having been conducted by the FBI in its drive to "disrupt, destabilize and destroy" the Black Panther Party.

In any event, when Ronald Reagan became president in 1981, one of his first significant acts was to create the Federal Emergency Management Agency (FEMA). A primary task of FEMA is to coordinate the operations of local, state, and federal (including military) forces, along with those of selected "private citizen organizations" in times of "civil disorder." This is exactly the script laid out in Garden Plot and Cable Splicer, and is very much the thrust of what was done on Pine Ridge. Accordingly, Reagan's choice as founding director of FEMA was Louis O. Giuffrida. In turn, Giuffrida concocted ever more refined versions of his original scenarios, "war-gaming" them in exercises dubbed "Rex-84," "Rex-85," and so on. The basis on which the 1973–1976 reign of terror on Pine Ridge was imposed has, as a consequence, been formally adopted as national policy, applicable to all dissident groups, and, at least in principle, to the citizenry as a whole.

Firefight at Oglala

The problem with the FBI's counterinsurgency initiative on Pine Ridge is that it didn't work. By the spring of 1975, having absorbed at that point some fifty fatal casualties, hundreds wounded or seriously injured, and the great bulk of the Wounded Knee trials, the resistance on Pine Ridge remained very much unbroken. Indeed, given that AIM's security component had begun to organize itself in armed defensive clusters at various places around the reservation, there was every indication that a resurgence was in the offing. Since this was beyond the capacity of the GOONs' roving hit teams to deal with—according to Brewer, they had already begun to back away, considering attacks upon the AIM strong points to be "suicidal"—a pretext was needed that would allow the FBI itself to (re)enter the reservation with sufficient force to wrap things up, once and for all.

The incident designed to serve this purpose materialized during the late morning of June 26, 1975, when two agents, Ron Williams and Jack Coler, approached an encampment established by the Northwest AIM Group, one of the movement's more proficient security teams, on the property of Harry and Cecelia Jumping Bull, elderly traditionalists who lived a few miles south of the reservation town of

Oglala. Although the FBI men were ostensibly there to serve the earlier-mentioned arrest warrant on Jimmy Eagle (a document that in reality did not yet exist), they made no attempt to do so. Instead, stopping their cars in an open field a short distance from the treeline in which the AIM camp was located, they opened fire. In short order, receiving heavy return fire, they were radioing frantically for backup. Soon thereafter, both were dead.

Given the remote location in which the altercation occurred, the help they had requested had nonetheless begun to arrive almost immediately. The FBI would later claim that some 150 BIA SWAT personnel prepositioned in the immediate area were "coincidentally" there because of an unrelated training exercise. This does not explain, however, why the bureau itself had an equivalent force of its own SWAT men already assembled at its Quantico, Virginia, facility, apparently awaiting the signal that the fighting had begun. (They, along with SWAT teams assigned to the Minneapolis, Chicago, Denver, and other FBI field offices, were on-site at the Jumping Bulls' before the firing stopped, late the same afternoon.) Nor does it explain why William Janklow just "happened" to be waiting by his phone in Pierre, the South Dakota state capital, a plane ready at the airport to whisk him halfway across the state to Hot Springs, in time to round up a group of local vigilantes and drive seventy-five miles to the scene while the firefight was still raging.

Although the FBI's planning is murky, it appears that Coler and Williams were sent to instigate a gun battle that would trigger first an overwhelming assault on the Northwest AIM position by BIA SWAT teams and then an avalanche of FBI SWAT personnel to mop up similar "compounds" elsewhere on the reservation. It was anticipated that there would be no more than eight AIM security men in the encampment when the two agents approached, however. In the event, there were more than thirty, and it was this miscalculation that cost them their lives. The BIA men, unnerved by the unexpected volume of gunfire coming from the AIM group, took up blocking positions around the Jumping Bull property rather than mounting an attack. As FBI units arrived, they did the same. Not only were Coler and Williams abandoned to their fate thereby, but—with the exception of an AIM member from Couer d'Alene, Idaho, named Joe Stuntz Killsright, killed by a sniper at long range—all the "insurgents" involved managed to escape.

Seeking to put the best face on a tremendously embarrassing situation, the FBI immediately barred the press from coming near the scene and, in the morning, convened a press conference. At that point, Tom Coll, a "public information specialist" flown in overnight from Washington, "explained" what had happened. The agents had been "lured" into an "ambush" by "AIM guerrillas" who had fired on them with "automatic weapons" from a "sophisticated bunker complex." Each man, Coll continued, had been "riddled by as many as thirty bullets fired at point-blank range," then "stripped," and, in one account, "scalped." Coll even provided reporters with the last words of one of the agents, supposedly uttered a moment before he was "viciously executed." How Coll could possibly have known this, unless he or some other agent had been close enough to hear, was an obvious question, left unasked by the assembled media representatives.

None of this was true, as the FBI was well aware. The bureau had, after all, *sent* the slain agents to the Jumping Bulls', so there was no question of their having been "lured." The FBI also knew that both men had suffered only three—not "thirty"—wounds and that neither had been stripped or scalped. It had also controlled the crime scene for more than eighteen hours before the press conference was held, so it knew there were no "bunkers." It would be more than a week before this admission came, however. In the meantime, headlines across the country were depicting AIM as "a gang of mad dog killers" (lurid stories concerning the Skyhorse/Mohawk case were running simultaneously). Misled in this manner, the public raised no objection as the FBI went swarming onto Pine Ridge 400 strong, decked out in army-issue combat fatigues, armed with military M-16s, and equipped with APCs and Huey helicopters. For the next two months, these forces conducted Vietnam-style "sweeping" operations across Pine Ridge, kicking in doors, and mounting what it referred to as "air assaults" on the properties of known AIM members on both Pine Ridge and Rosebud. Before it was over, several people were dead, and even a few of the GOONs were protesting that things had gone too far.

With attention thus distracted, federal officials seized the opportunity to have Dick Wilson fulfill his end of the bargain that had propelled him into office in the first place. In early July, he traveled to Washington where he signed a preliminary document transferring title to the northwestern one-eighth of Pine Ridge—an area known as the Sheep Mountain Gunnery Range—to the Interior Department's National Park Service, ostensibly so that it could be incorporated into the Badlands National Monument. Unbeknownst to the combatants slugging it out on the

reservation, and most likely to Wilson himself, the department had been aware for some time that the parcel contained a rich deposit of uranium intermixed with molybdenum. The public law by which Congress formalized U.S. possession during the spring of 1976 was later amended to allow the Oglalas to recover the surface area involved, but *not* the subsurface mineral rights.

This accomplished, and with AIM finally pounded into something resembling total disarray, FBI special operations chief Richard G. Held, who had been sent to Pine Ridge to oversee the bureau's blitzkrieg, quietly informed his superiors that his mission was complete. In September, he returned to Chicago, where he had earlier been assigned as the special agent in charge of handling the FBI's role in the 1969 assassinations of Illinois Black Panther leaders Fred Hampton and Mark Clark. So exemplary was his service considered in both the Pine Ridge and Hampton/Clark connections that, although he had already reached retirement age, his term of service was extended so that he could be promoted to the position of FBI associate director. Others involved in the reservation offensive—among them Held's son, Richard W., who had excelled in the Los Angeles field office's COINTELPROs against the Panthers a few years previously—were also proportionally rewarded.

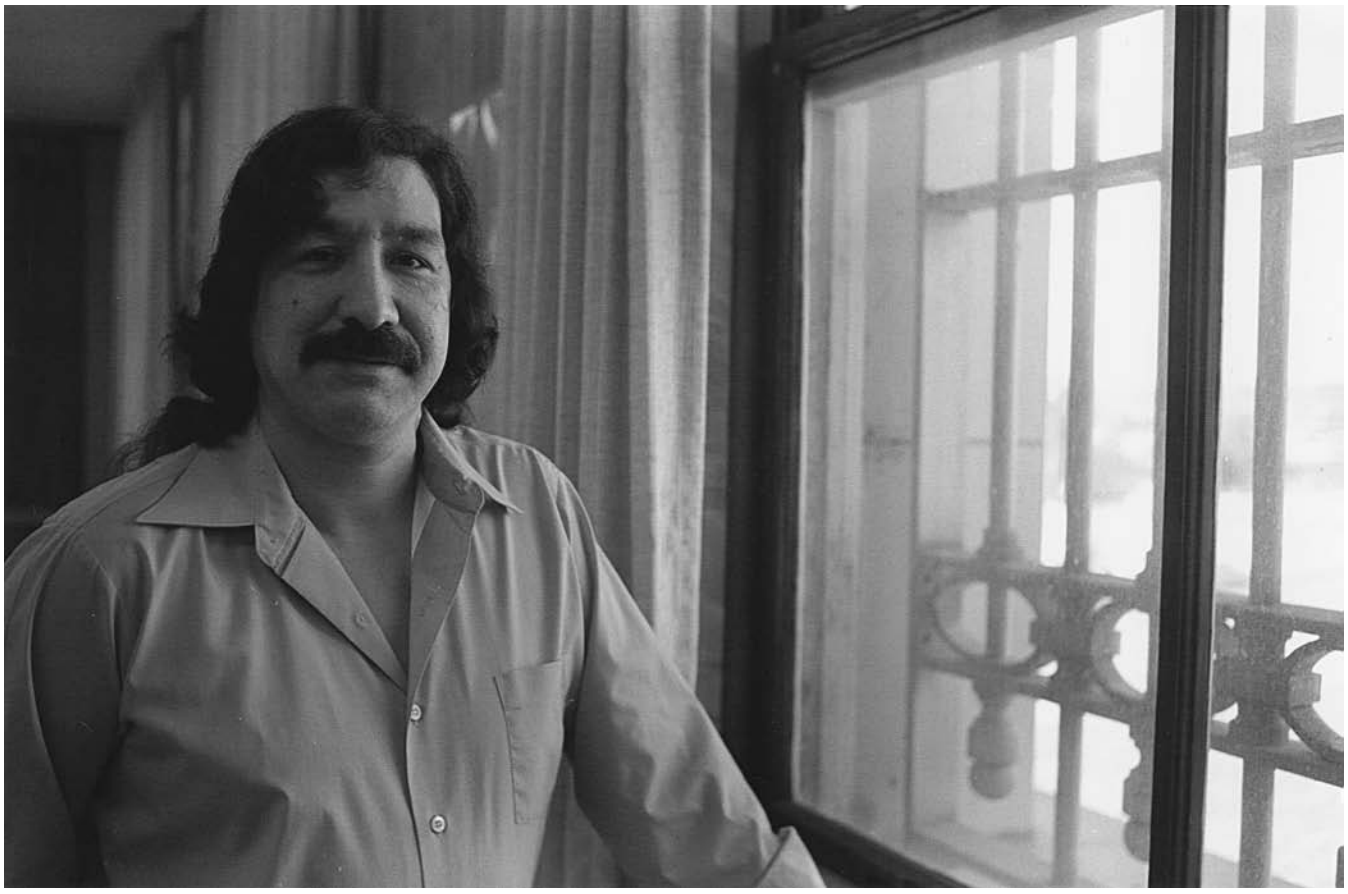
RESMURS and the Case of Leonard Peltier

By the fall of 1975, the FBI had undoubtedly come to view its Pine Ridge operation as an overall success, but a few loose ends remained to be tied up. One of these concerned the fact that the loss of Coler and Williams represented the first time two FBI men had been killed in a single confrontation since the bureau's "gangbuster days" of the mid-1930s. Public image and agent morale alike dictated that *somebody* would have to pay. It also seemed advisable to undertake follow-up measures designed to ensure that AIM would be unable to once again reconstitute itself in the wake of the battering it had received. The means to both ends resided in an "investigation" captioned RESMURS ("REServation MURderS"; the acronym applied *only* to the deaths of Coler and Williams, *not* to the scores of unsolved Indian homicides with which the bureau was then—and is still—backlogged).

Although the bureau was aware from the first that a number of local Oglalas had participated in the firefight, it elected to target Bob Robideau, Dino Butler, and Leonard Peltier, men perceived as forming the backbone of Northwest AIM. There is no indication that the FBI actually believed the three were any more responsible for what had happened than anyone else. Rather, since they were all "outsiders," focusing on them was simply a convenient way of dividing AIM and its supporters among themselves. In effect, defending the accused would require local Oglalas to potentially incriminate one or more of their own; their failure to do so, however, would sever the bonds of trust underlying AIM's effectiveness on Pine Ridge. Accordingly, charges initially brought against Jimmy Eagle as a "fourth defendant"—a matter of appearance, since Coler and Williams were supposedly pursuing him when the firefight occurred—were unceremoniously dropped so that "the full prosecutorial weight of the federal government" could be brought to bear against the preferred defendants.

Dino Butler was captured during an air assault on Crow Dog's Sun Dance in early August 1975, and Bob Robideau a short while later, after he was temporarily blinded by the explosion of his car on the Kansas Turnpike, near Wichita. Peltier had meanwhile escaped to Canada, where he found refuge in Small Boy's Camp, a traditional Cree community in the mountains of west-central Alberta. Arrested by the Royal Canadian Mounted Police in February 1976, he petitioned for a grant of political asylum. This petition was denied, and he was extradited to the United States in June the same year, mainly on the basis of a fraudulent "eyewitness affidavit" prepared by the FBI and introduced in Canadian court. This official submission of false evidence, a flagrant violation of the U.S./Canadian extradition treaty, was later revealed and led to a formal protest and demand that Peltier be returned to Canada's jurisdiction. So serious was the treaty fraud considered that, in 1986, the Canadian parliament also entertained the possibility of canceling its extradition agreement with the United States altogether.

It was originally planned that Butler, Robideau, and Peltier would be tried together, on the premise that they had acted in concert and as part of a mutual conspiracy to murder FBI agents. Since Peltier was still fighting extradition during the spring of 1976, prosecutors proceeded against Butler and Robideau in Cedar Rapids, Iowa, on June 7. At trial, the government's credibility was once again undermined by its reliance on transparently false witnesses. Contentions that AIM was a "terrorist" organization were countered by calling FBI director Clarence Kelley to the stand; questioned by defense attorney William Kunstler, Kelley was forced to concede that the



American Indian Movement activist Leonard Peltier stands in prison in 1986. Although he was convicted of the 1975 murder of two FBI agents, many believe he was innocent. *(AP Wide World Photos)*

bureau possessed "not one scintilla" of evidence to support such allegations. To cap things off, the plausibility of Butler's and Robideau's claim that they'd acted in self-defense received substantial reinforcement when they called William Muldrow to describe the FBI-instigated reign of terror he and Shirley Witt had discovered on Pine Ridge.

On July 16, an all-white jury returned verdicts of not guilty on all counts, noting that the defendants had "done only what any reasonable person would do, under the circumstances" created by the FBI itself. It was clear—since Bob Robideau had testified that he'd personally shot both agents—that the jury believed no murders had occurred. This placed the Justice Department in a serious quandary. The outcome of a high-level meeting to discuss their options, however, resulted in a stint of judge-shopping in which officials secured the services of Paul Benson, a North Dakota district jurist who was willing to restrict to the scope of evidentiary consideration solely "to the events of June 26, 1975," and thus rule the entire Cedar Rapids trial record inadmissible. Prosecutors then proceeded against Peltier with the argument that he had acted as a "lone gunman," a premise they could not have believed, assuming they were in the least sincere about the truth of the case they had presented against Butler and Robideau.

During Peltier's trial, which began on March 21, 1977, defense attorneys, unable to cross-examine effectively because of the judge's evidentiary rulings, were forced to listen as FBI men gave substantially different accounts of events from those they had sworn were true in Cedar Rapids. The capstone came with the testimony of an agent name Fred Coward, who had not even been mentioned during the Butler/Robideau trial. He claimed to have seen Peltier through a rifle scope on the fatal day, carrying an AR-15 rifle in close proximity to the dead agents' bodies. This evidence was crucial because FBI ballistics expert Evan Hodge also claimed, on the basis of a mysterious

shell casing allegedly found in the trunk of Coler's car, that the final rounds hitting Coler and Williams had been fired from an AR-15. Moreover, Hodge claimed, his overall examination of crime scene evidence indicated that AIM members had used only one such weapon during the firefight. *Ipso facto,* whichever AIM member could be linked to an AR-15, as Coward did with Peltier, would appear to the jury to be the killer. Hodge also testified that a toolmarks comparison matched the key shell casing to an AR-15 recovered from Robideau's burned-out car along the Kansas Turnpike (thus "proving" that the Northwest AIM Group had been in possession of the "murder weapon").

With this groundwork laid, prosecutor Lynn Crooks used his closing argument to depict in graphic detail exactly how Peltier was supposed to have cold-bloodedly "executed" both agents, even borrowing from Tom Coll's long-discredited fabrications to recount how one of the agents had begged his killer not to pull the trigger. On April 18, 1977, after only six hours of deliberation, the jury found Peltier guilty of double-homicide, and, on June 1, Benson sentenced him to serve back-to-back life sentences. Although this was his first conviction, he was taken directly to the federal "supermax" prison at Marion, Illinois, a draconian facility ostensibly reserved for "incorrigibles" who had already proven unmanageable in regular penal settings.

WKLDOC attorneys quickly submitted an appeal based on Benson's handling of the trial. It was considered by a three-judge panel of the Eighth Circuit Court, chaired by Chief Judge William Webster. Toward the end of 1978, the panel delivered a finding that, although the record revealed more than thirty reversible errors, any one of which would have been sufficient to send a normal case back to trial, Peltier's conviction would be allowed to stand. The opinion had been written by Webster, who by the time it was read had already left the court to take up a new position as director of the FBI. The Eighth Circuit declined to conduct an *en banc* hearing to reconsider Webster's plainly conflicted decision, and the U.S. Supreme Court refused to review it as well.

While all this was going on, WKLDOC had also filed a suit under the Freedom of Information Act (FOIA) to obtain all FBI documents relating to the RESMURS investigation. This resulted in the release, in 1981, of some 12,000 pages of often heavily redacted material that had not been disclosed to the defense before or during Peltier's trial. (The FBI stated that it was withholding an additional 6,000 pages on "national security" grounds, but, in 2002, it was forced to admit that it had "overlooked" a further 42,000 pages when the original release was made.) Among the documents was an October 12, 1975, teletype flatly contradicting Evan Hodge's trial testimony. A comparison of the firing-pin markings made by the "Wichita AR-15" and those on the all-important mystery shell casing had actually produced negative results. Peltier's attorneys were therefore able to file a second appeal, resulting in hearings on the FBI's ballistics evidence in 1984. Interrogated by William Kunstler, Hodge unraveled on the stand, being caught in the process of committing perjury and having to admit that AIM members had used not one but *several* AR-15s during the Oglala firefight.

In oral arguments before another panel of the Eighth Circuit Court on October 15, 1985, Lynn Crooks did his best to salvage the situation, arguing—in diametrical opposition to his own closing statement to the jury—that, although he had "no idea who actually shot the agents," it didn't really matter, since Peltier had "actually" been convicted, not of murder, but of "aiding and abetting whoever committed the murders." When a judge asked who Peltier might have aided and abetted, since his codefendants had been acquitted, Crooks replied that perhaps he had aided and abetted himself. It took the three judges eleven months to craft a finding in which they both rejected Crooks's new theory and declared the circumstantial case presented against Peltier at trial to have been false and misleading while *still* allowing his conviction to stand. Once again, the U.S. Supreme Court refused to review the matter.

Since then, although Peltier has been moved to the "normal" federal maximum security prison at Leavenworth, Kansas, he has been routinely denied parole. (He is still serving the first of his life sentences.) The government has ignored petitions for a retrial signed by more than 14 million people internationally, requests by several foreign governments to the same effect, a finding by Amnesty International that Peltier is a "prisoner of conscience" (i.e., a wrongfully incarcerated political prisoner), and much else. In January 2001, faced with significant public protests by FBI agents—the first such demonstrations in the history of the bureau—President Bill Clinton failed to sign a long-promised commutation of his sentence. Peltier therefore continues to serve his time, a symbol of the federal government's arbitrary ability to repress the legitimate aspirations to liberation of indigenous people.

AFTERMATH

By the time of Peltier's conviction and initial appeal, the movement was in serious decline. Its reputation even among activists suffered badly as the result of rumors, quite possibly true, that in February 1976 AIM members had murdered one of their own, a Mik'maq named Anna Mae Pictou Aquash, in the mistaken belief that she was an FBI informant. (Aquash had been "bad-jacketed," a standard COINTELPRO technique—employed with devastating effectiveness against the Black Panther Party—by which legitimate activists are made to appear to be police infiltrators.) In 1979, shortly after his entire family—his wife, Tina, their three children, and his mother-in-law, Leah-Hicks-Manning—were murdered on the Duck Valley Reservation in Nevada, John Trudell resigned his position as the only remaining "national" AIM officer and announced that all comparable positions had been abolished. No one disputed his statement, for there had been no general membership meeting since 1975.

There were occasional flurries of activity, as when, in 1978, Dennis Banks utilized his California sanctuary as a base from which to organize The Longest Walk, a march from San Francisco to Washington, D.C., designed to protest pending legislation introduced by reactionary Congressman Lloyd Meeds and others to repeal all treaties with American Indians. The walk undoubtedly figured in the bills' subsequent defeat, but a larger reason was probably the fact that U.S. claims to the legitimacy of its territorial title are based largely on those very same treaties. Thereafter, although he has coordinated a virtually endless series of walks and runs meant to draw attention to native issues, Banks, too, announced his "retirement" from AIM.

In 1979, Jimmie Durham, along with IITC's associate director, Paul Chaat Smith, resigned their positions as well, citing the development of the organization's overly cozy relations with certain governments and an encroaching sense of "professionalism" on the part of several of the organization's trustees as their reason. During the mid-1980s, Durham's and Smith's observations were amply borne out when the IITC incorporated itself and appointed a handpicked board to replace the council of traditional elders at whose behest it had been founded and who had overseen its functioning. The new board immediately propelled the Treaty Council into alignment with Nicaragua's Sandinista government, in opposition to the self-determining rights of the country's indigenous peoples. This maneuver splintered what was left of AIM and fractured the unity previously displayed by native delegations to the UN. Founding trustee Russell Means, who protested IITC's abandonment of principle, was thereupon "expelled." Although IITC continued to claim representation of "98 indigenous nations throughout the Western Hemisphere," most of these had distanced themselves by 1986. The Treaty Council itself continues to exist but without a discernible base of grassroots support. It has thus become essentially an appendage of the very statist entities it was created to oppose.

In 1981, having by then completed the parole stemming from his criminal syndicalism conviction, Means spearheaded the seizing of an 880-acre tract in the Black Hills National Forest, near Rapid City. Dubbed "Yellow Thunder Camp," after Raymond Yellow Thunder, the site was continuously occupied until 1985, during which period the FBI and U.S. Marshals Service were legally enjoined from intervening as AIM battled the National Park Forest Service in court for the right to stay. AIM actually won a landmark decision at the district level: Judge Robert O'Brien entered a ruling that the Lakotas, and thence other Indians, were entitled to view entire geographic areas as sacred sites, and therefore to enjoy use and in certain instances occupancy of them. But the victory was soon nullified by the U.S. Supreme Court's adverse decision in the so-called G-O Road case (*Lyng v. Northwest Indian Cemetery Protective Association* [1988]).

Probably the last major hurrah of the American Indian Movement came during the early 1990s, when Means, along with Colorado AIM leader Glenn Morris, organized a coalition of twenty-five local organizations in Denver to conduct a sustained series of demonstrations protesting the annual Columbus Day parades held in that city. The outcome was a last-second cancellation of the event in 1992, the year a particularly extravagant "celebration of genocide" was planned in honor of the five hundredth anniversary of Columbus's "discovery of America." A particular highlight occurred during the summer of 1992, when a jury considering charges that Means, Morris, and two other Colorado AIM leaders had violated the First Amendment rights of Columbus Day organizers in 1991 by blocking their parade route, not only acquitted the four but stated their belief that the city of Denver had violated international law by issuing a permit for the event.

AIM's Denver victory stimulated signs of life in chapters located elsewhere in the United States. These flashes of even modest resurgence produced indica-

tions that the FBI was still at work making sure the genie stayed in its bottle, however. In a bizarre twist, a barrage of notices were shortly issued by an entity calling itself the National American Indian Movement, claiming that the Colorado chapter was fraudulent, that its leadership was composed of "white men masquerading as Indians" and "probable police agents," and that the entire group had therefore been "summarily expelled" from AIM. As it turned out, "National AIM" was actually a Minnesota-chartered/Minneapolis-based nonprofit corporation, with no "membership" as such, subsisting on hefty infusions of federal funds. Nonetheless, the confusion it generated before its true nature was revealed was sufficient to negate any potential for a genuine revitalization of the movement.

Despite their demise after the mid-1970s, Red Power politics—those of AIM in particular—transformed the circumstances of native North America in ways that may well prove irreversible. If nothing else, the "shock troops of Indian sovereignty," as a grassroots Lakota named Birgil Kills Straight once called them, moved "like a hurricane" through Indian country long enough to instill a sense of pride among people in whom it had been long and terribly diminished, forced Indian issues into the public consciousness for the first time in generations, and proved that gains could be made by going—and sometimes *only* by going—toe-to-toe with the oppressor. That such understandings have not been lost is reflected in the armed confrontations with authorities undertaken by the Mohawk Warriors Society at Oka, near Montreal, and elsewhere during the 1990s. Where this will lead during the new century remains to be seen, but the future surely seems brighter than it did a half-century ago, given the success of militant struggles for Native American rights.

Treaty Rights and Indian Activism from Alcatraz to NAGPRA

American Indian lands are, in some sense, *not* truly Indian lands. Reservations, established by treaty (or, after 1871, by executive order), are held "in trust" for the tribe by the federal government. The federal government has maintained quasi-colonial oversight of tribes and their territories, administered by the Bureau of Indian Affairs (BIA) in the paternalist tradition of the guardian-ward relationship. Established in 1824, the BIA has the dubious distinction of being the oldest and most deeply entrenched federal agency. By the 1960s, many BIA employees were Native Americans hired to facilitate federal administration of tribal lands and lives. Tribal governments, meanwhile, especially Indian Reorganization Act (IRA) governments, were "puppets": elected and organized according to federal guidelines. Dependent upon federal appropriations and approval, they were seriously disconnected from their constituent communities. With the BIA and tribal government determining policy and process, the majority of reservation residents were left without power or voice. Fueled by military experience, urban residence, and education, intertribal associations developed to fill the political void. Emerging demands for "Treaty Rights" and "Red Power" evolved into a social movement for self-determination that continues to be pressed, with uneven success, to this day.

Native American treaty rights, always lurking in the background of federal-native relations, paradoxically gained the spotlight during Termination. Serving the goal of getting the federal government "out of the Indian business," the Indian Claims Commission, established in 1946, sought to settle old grievances and allow the government to move on to new concerns. Terminating old grievances was often associated with terminating tribes themselves and thus tribal treaty rights. Everyone "knew" that tribes were disappearing, and with their disappearance, the future of treaties was also clear: they would become vacuous, null, and void. The Indian Claims Commission was established in part to hasten, or at least facilitate, that process, compensating treaty violations with cash payments. By its very focus on treaties as the source and substance of claims, however, the commission catalyzed treaty rights activism. It is not surprising, then, that the occupation of Alcatraz, which initiated a new era of Native American activism, asserted their "treaty rights" to the island.

Treaty rights, as special rights of legally distinct groups of American citizens, defy civil rights as the equal rights of individual American citizens. In 1968, the Indian Civil Rights Act (ICRA) made all too clear the tension between tribal rights and civil rights; ICRA provided protections to individual tribal members and simultaneously extended federal controls on tribal governmental process. The same year saw the founding of the American Indian Movement (AIM) in Minneapolis to advance native civil rights there (especially in regard to poor housing, high unemployment, and police brutality). Energized by the broader civil rights movement, Native American activists elsewhere publicized the contemporary relevance of treaty rights and the contemporary reality of native peoples and "Indian issues" in their occupation of the decommissioned federal penitentiary on Alcatraz Island and at many other sites across the country.

Alcatraz

Actually, there were two occupations of Alcatraz: both claimed the island based on the 1868 Fort Laramie Treaty with the Sioux Nation. In 1964, five Lakota men occupied Alcatraz for four hours, claiming it for all Native Americans but on the basis of the 1868 treaty with their tribe. Five years later, eighty-nine Indians of All Tribes, only some of whom were Lakota, claimed their right to occupy the land based on the same 1868 Sioux treaty. The treaty, they asserted, gave Native Americans the right to unused or decommis-

Demanding that the federal government return possession of Alcatraz Island to Native Americans, members of the Indians of All Tribes Inc. stand in solidarity on November 25, 1969. The seizure of the island in San Francisco Bay five days earlier marked the rise of modern Native American militancy. *(AP Wide World Photos)*

sioned federal land anywhere in Indian Country. A devastating fire at the San Francisco Indian Center had left the local native peoples without a gathering place: Alcatraz was reclaimed in part to provide a new, intertribal space in the Bay Area.

The occupation of Alcatraz included and introduced hundreds of Native Americans from around the country, catalyzing a new activism later described as "Red Power." The occupation itself lasted nineteen months, until June 1970, when the remaining fifteen protesters were removed by federal marshals. Failure to gain the land, however, was offset by success in winning media attention and public support. Vine Deloria has said that "Alcatraz was the master stroke of Indian activism," simultaneously galvanizing native identity and action and demonstrating the continuing, contemporary reality of native peoples and Native American issues in America. Wilma Mankiller, later highly acclaimed principal chief of the Oklahoma Cherokee, said of her Alcatraz experience:

> I'd never heard anyone actually tell the world that we needed somebody to pay attention to our treaty rights, that our people had given up an entire continent, and many lives, in return for basic services like health care and education, but nobody was honoring these agreements. For the first time, people were saying things I felt but hadn't known how to articulate. It was very liberating.

Wilma Mankiller's experience typified that of many other "warriors without weapons," who resisted by their silence, often melting into the formal educational pot. Eventually, this silence grew into civil disobedience and political demonstration under the leadership of urban intertribal organizations and individuals. Tribal issues and treaty rights were what distinguished Native American issues and were of paramount concern to activist groups, including AIM and its gender-based offshoot, Women of All Red Nations (WARN). In the United States, tribes were "domestic dependent nations," compromised in their sovereignty and vulnerable—especially after the U.S Supreme Court's *Lone Wolf v. Hitchcock* (1903) decision—in their treaty rights. Well aware of this conundrum, the members of the International Indian Treaty Council pursued self-determination and treaty rights in the international arena. Their work led to the convocation of the first United Nations meeting of Indigenous Peoples in Geneva (1977), the United Nations Working Group on Indigenous Populations (1982), and eventually, to the Declaration of Rights of Indigenous Peoples (1992), which established a new standing for native nations in international law.

Since the 1961 American Indian Chicago Conference (AICC), intertribal "Indian" identity, arbitrarily imposed by federal policy and legislation, had become a proactive political and social reality. The NIYC (National Indian Youth Council), formed at the AICC, ensured the future of such intertribal activism. NIYC members cut their political teeth on treaty rights activism in Washington and Oregon. "Fish-ins," although named and organized following the civil rights "sit-ins" in the South, focused on the special rights of Native Americans as tribal citizens, not the equal rights of all people as American citizens. Many of those involved in the fish-ins were not members of the tribes whose treaty rights to fish at the "usual and accustomed stations" had been violated: they demonstrated on behalf of the specific rights of certain native peoples, but also on behalf of treaty and tribal rights in general. Fish-ins were followed by legal action in regard to reserved fishing rights, notably in

what is generally known as the Boldt decision (*U.S. v. Washington*, 1974), upholding a century-old treaty guaranteeing off-reservation fishing rights to tribes in the Northwest. The Boldt decision was seen throughout the country as a substantial victory for treaty activists and provided hope that the legal institutions of the United States would provide a forum for redress for native peoples.

A small group of attorneys, including John Echohawk and others associated with the University of New Mexico law school, began to pursue tribal and treaty rights in the courts as others advanced Red Power by political action. The Native American Rights Fund, now located in Boulder, Colorado, was established for this purpose in 1970, the same year the occupation of Alcatraz ended and 48,000 acres including Blue Lake, taken illegally from the people of Taos, were returned to the Pueblo. While the differing modes of action—political and legal—were not coordinated, they served the same goal and were, in general, mutually supportive.

Alcatraz had convinced young Native Americans of the possibility and the potential of political protest. It contributed directly to the AIM-organized cross-country "Trail of Broken Treaties" caravan from the West Coast to Washington, D.C., in 1972. The Twenty Points position paper, drawn up by Minneapolis AIM, put treaty rights first. The document called for the repeal of 1871 legislation ending federal treaty making with American Indian nations; sought the establishment of a treaty commission to sign new treaties and a presidential commission to recommend corrective action for federal violations of existing treaties; called for Senate review of the many signed but unratified treaties; and noted that a federal injunction on actions that threatened treaty rights was to be available during lengthy court determinations. Finally, and importantly, the *Indian* interpretation of treaties was to be declared binding unless successfully challenged in court. Unfortunately, serious consideration of the Twenty Points was lost in the organizational and spatial melee of the BIA takeover with which it unexpectedly ended. Perhaps it is not surprising, then, that, mere months later, violence became part of AIM action at Wounded Knee.

American Indian Movement

AIM organized and energized the 1973 siege of Wounded Knee as it had the Trail of Broken Treaties only months before. Its involvement on Pine Ridge had begun the year before with a protest march in reaction to the murder of Raymond Yellow Thunder in nearby Gordon, Nebraska. That earlier action was lauded by the majority of Pine Ridge residents, whereas the Wounded Knee action addressed and inflamed intratribal and intergenerational tensions. An AIM-encouraged effort to impeach Chairman Richard Wilson as a puppet leader had solidified tribal political factions, which ultimately expressed their differences in a violent and armed conflict with repercussions well beyond the reservation borders. The seventy-one-day conflict resulted in the death of two Native Americans, federal causalities, and injuries of unknown numbers of people on both sides, and it also ended in lawsuits and prison terms. When the siege ended on May 9, 1973, political tensions persisted. The now familiar Treaty of 1868 was again invoked; again in a questionable manner, by Russell Means, reiterating the central role of treaties in Native American social movements:

> The FBI must have known from the first day, when we presented our demands . . . that Wounded Knee was about our treaty rights—about the [1868] Fort Laramie Document that affirmed Oglala sovereignty. We were risking our lives not only for the right to select our own officials, but also to choose our own system of government.

AIM occupation and activism on reservations continued, and continued to point out differences in political perspective between generations as well as between urban and reservation native peoples. On the newly restored Menominee reservation, the Menominee Warrior Society adopted AIM tactics in its takeover of the Alexian Brothers novitiate building, in an effort to dramatize self-determination. Much of the focus of activism, AIM or otherwise, seems to have been about self-determination. The number and voice of native peoples residing in cities were important aspects of this focus. During the 1970s, the number of Native Americans in cities was approaching, if it had not already equaled, the number on reservations. (Census counts of the urban native population are notoriously low, whereas reservation counts tend to be more accurate.) The urban experience, including formal education, the impact of 1960s-style radical thinking and activism, and the construction of difference in urban identity politics encouraged a rethinking of Native American cultures and histories and a renewed commitment to self-determination.

Improbably, President Richard Nixon agreed. Nixon's policy of "self-determination without termination" meant that the federal government would be

held to its treaty agreements with Native American tribes, and tribes would take a more active role in their own governance and development. In addition, to prepare Native American children for a self-determined future, tribes were to be afforded the primary role in education. The 1975 Indian Self-Determination and Education Assistance Act was the legislative expression of this new federal policy. It directed the secretary of the Interior to contract directly with tribal organizations to plan, direct, and execute tribal programs, including those currently administered by the BIA. That 1975 act has been amended, improved, and expanded over the years, but it continues today as the fundamental legislative assertion of tribal right to determine and administer services owed as a result of treaties.

In 1975, "education" referred primarily to pre-college education in survival schools that followed the AIM model in the Heat of the Earth school in Minneapolis. The future of self-determination, however, depended upon succeeding generations of tribal leaders being able to hold their own in government-to-government negotiations and being educated in tribal and Native American histories and issues. Tribally controlled community colleges developed to fill the postsecondary void in reservation education, taking as their mission education for self-determination and self-determined education. A new type of "warrior" had arisen. The "warriors without weapons" gave way to groups like AIM and the Menominee Warrior Society; the new warrior was the "briefcase warrior," whose weapons were education and the law.

The Tribally Controlled Community College Assistance Act, providing federal education funds for tribal colleges, was passed in 1978, still under the Nixon administration. The same year saw the American Indian Religious Freedom Act, the Indian Child Welfare Act, the land claims settlement for the Passamaquoddy in Maine, and the *Santa Clara v. Martinez* and the *Oliphant v. Suquamish* U.S. Supreme Court decisions, which interfered with tribal self-determination and sovereignty. It was a legally schizophrenic year, reflecting the fundamental contradictions between the reality of treaty rights, federal Native American law, and "domestic dependent nation" status, and the inevitable tensions arising out of these often conflicting realities.

Most important in the American Indian Religious Freedom Act were the *whereas*-es, which recognized the limitations on religious rights. The act itself carried scant remedy and compelled little change, but it certainly and clearly acknowledged the (sometimes incidental) abuse of the native peoples' religious freedom by federal departments and agencies. First Amendment nonestablishment protections defeated essentially every sacred lands case that came before the Court, making it clear that Native Americans were to have their religious freedom, but not the sacred lands upon which that depended, even though the control of those lands had been taken from them in violation of treaty agreements. A ski resort in the West, camping and motorcycles in the Black Hills, recreational boating on Lake Powell, logging in California, were all considered "compelling state interests" that trumped Native American claims to sacred lands. The differences in native and Court interpretations were highlighted in the *G-O Road* case (*Lyng v. Northwest Indian Cemetery Protection Association,* 1988) where the Yurok high-country stood between finished segments of a major logging road and was considered unimportant in terms of Yurok religious freedom since, it was claimed, so very few people ever went there.

The Indian Child Welfare Act (ICWA), however, had a large and lasting impact. ICWA affirmed tribal control of tribal domestic issues, especially in regard to the removal and placement of neglected and abused children. More than any other act, ICWA caused non–Native American court systems to recognize and respect tribal courts. Indeed, it led to the establishment of courts in many tribes that had not yet developed them. In these ways, ICWA provided a strong legislative statement of Native American sovereignty and self-determination. Native families were supported in both titles of the act: extended family members were given priority in the placement of children removed from their parents, and family supportive services were mandated.

In the Court, *Martinez* seemed to underscore tribal self-determination by supporting the tribal right to determine its own membership through sovereign immunity as rendered in the decision. *Oliphant v. Suquamish* decidedly interfered with tribal sovereignty and self-determination, denying tribal criminal jurisdiction over nonmembers. The Court seemed in some sense at odds with the Congress: that was not new. But at odds with itself, again, the inherent tensions in federal Native American law were revealed. The legal struggle continued and continues: when the Court is understood as conservative and ill-disposed to Native American rights concerns, attention is focused on congressional lobbying efforts. Such is the situation at

the time of this writing. Briefcase warriors must be politically savvy as well as legally knowledgeable to defend and assure tribal sovereignty and self-determination.

The conjunction of legal action and political demonstration addressing both land rights and religious freedom can be seen in the struggle over the Black Hills. In 1979, the U.S. Court of Claims ruled that the 1877 federal seizure of the Black Hills was unconstitutional, and entered a judgment in favor of the Lakota for $105 million. The decision was affirmed by the U.S. Supreme Court in 1980. The tribe, however, would not accept compensation and sued for the return of the Black Hills as well as $11 billion in damages. The case was dismissed on the grounds of the sovereign immunity of the United States. Members of AIM then established the "Yellow Thunder Camp" (named after Raymond Yellow Thunder, whose murder first introduced AIM to the Pine Ridge reservation) to gain public support and reiterate the Lakota claim. To this day, the Lakota have continued to refuse financial compensation for the taking and to press for the return of their lands.

Although the Nixon administration supported significant advances in Native American self-determination, the appropriations to support that self-determination were lacking. Native American social movements in the decade of the 1980s focused on reservation economic development. Reservation communities invariably came in at the bottom of all the poverty and social parameters measured by the census and other instruments. Self-determination, it was argued, cost money: without funds, sovereignty was a ruse. But a few voices called for a new perspective on the relationship between sovereignty and economy: the relationship was inevitable, but the order was reversed. Sovereignty preceded economic development instead of following it: sovereignty was the foundation upon which tribal economic development could and must proceed.

Gaming is certainly the best-known and most lucrative example of this logic. Tribal gaming depends on the special legal and political status of recognized tribes and the exemption of reservations from state regulations, including state gaming regulation. Tribal business became the new locus of tribal self-determination. Certainly, however, it is not the only such endeavor. As Rennard Strickland summarized: "A shift from the courtroom to the boardroom" had begun. With improved funding for the PL 638 Indian Self-Determination and Assistance Act contracts, more and more were negotiated, expanding tribal autonomy. Tribes continue to decrease their reliance on the BIA and other federal agencies and to increase their own direct control of tribal services and governance.

Reservation economic development commonly implies environmental deterioration. In the 1970s and 1980s, coal development on the Northern Cheyenne reservation in southeastern Montana provided a potential source of revenue to one of the poorest of the nation's tribes. Yet, a vocal and active group of tribal members derailed major coal development, seeking to sustain both natural resources and the environmental quality of the reservation for the generations to follow. Tribal members were between a rock and a hard place. Members of that small but successful group became the butt of physical and verbal attacks on the reservation for many years thereafter: they had effectively denied badly needed income to reservation families. Environmental issues rose to the fore throughout Indian Country in the 1980s as another expression of land, treaty rights, and religious freedom. Environmental concerns were addressed in both legal action and political demonstration. The relationship between tribe and national environmental groups was complex and problematic: the banning of eagle feathers, listed as one of the *whereas*-es in AIRFA (American Indian Religious Freedom Act), certainly anticipated this. Tribal air and water rights included rights to air and water quality, however, and such rights protected non–Native American as well as native peoples, as was clear in the Ladysmith mining case. In the region of the Ladysmith mine, the Great Lakes Indian Fish and Wildlife Commission (GLIFWC) consulted on behalf of constituent tribes on issues of the environment and treaty rights management. That the GLIFWC helped to organize treaty rights demonstrations makes clear the coincidence of legal, political, scientific, and social action work typical of the time. Most tribes today have enacted environmental and conservation ordinances that guide executive action.

As might be expected, anti–Native American backlash organizations and attitudes began to develop: among them, ERFE (Equal Rights for Everyone), STA (Stop Treaty Abuse), and PARR (Protecting American Rights and Resources) attracted a considerable following based on what were considered to be "sacred" American principles. Such groups were notable, especially in the Midwest, where the legacy of Fred and Mike Tribble's action to claim off-reservation inland spearfishing rights reserved to Great Lakes

Ojibwe set off widespread anti-spearfishing demonstrations and a chain of legal decisions. The popularity of "Treaty Beer," a fund-raising scheme for anti-treaty groups, attests to both the marketing ability of these groups and the continuing lack of understanding of Native American status and issues in the general population.

An unintended but nonetheless significant consequence of native activism was the "hardening" of ethnic categories and the identity markers by which they are claimed and ascribed. As tribal and Native American rights became front-page news, as the newly recognized and racially diverse Pequot Tribe established the largest and most lucrative gaming enterprise in the country, as Wilma Mankiller made the cover of *Time* magazine, and as *Dances with Wolves* (1990) played on romantic ideals, Native Americans began to focus on ownership of their own representations. Ownership and control of cultural resources became as important as ownership and control of land and natural resources. Museums were criticized as colonialist institutions, and museum collections came under scrutiny for holding sacred objects illegally obtained. The Smithsonian returned two war god statues to the Zuni, and the Heye Foundation repatriated sacred wampum belts to the Iroquois, both as the result of tribal legal and political initiative. Human remains held in museums became the focus of native activist interest in this period of time. The "civil rights of bones" and the human rights of native peoples were hotly debated, as local demonstrations, many of which included members of AIM, publicized Native American perspectives and claims. In Illinois, for example, the Dickson Mounds exhibit over a burial of unknown tribal affiliation was forced to change as a result of intertribal (including AIM) action.

The remarkable result of such actions and such claims was the Native American Graves Protection and Repatriation Act (NAGPRA) of 1990. Recognizing tribal ownership interest in human remains and associated funerary items and in sacred objects or objects of cultural patrimony, NAGPRA mandated the return of such remains or objects to recognized tribes that could clearly identify their affiliation with them. The legal reasoning behind NAGPRA holds that sacred items and items of cultural patrimony are owned by the community, not by individuals within it, and can only be alienated by the community: those held by gift or purchase from individuals, then, are illegally held. NAGPRA became the first federal act not only to acknowledge but also to incorporate Native American perspectives in a legal definition. Consultation with tribal representatives in the identification of sacred objects and objects of cultural patrimony is mandated by the law, thus recognizing diversity in worldview and requiring the incorporation of tribal knowledge into mainstream legal process. The legislation envisions a consultative rather than an adversarial approach. Federal Native American policy as articulated in NAGPRA clearly shows the impact of more than two decades of political and legal action. NAGPRA process and pragmatics, however, remain problematic.

The success of NAGPRA has been stymied by lack of congressional funding. The cost of reviewing inventories, consulting with museums and universities, and the logistics of particular repatriations are frequently beyond the financial abilities of the tribes. As a result, human remains and sacred items languish in federally funded institutions across the United States, still waiting to be returned. Demonstrating the cultural affiliation of human remains and sacred items has also proved cumbersome and contentious. Some academics and museum personnel have preferred pursuing their own research agendas to working in a cooperative spirit with the tribes, as has been amply illustrated in the controversy surrounding The Ancient One/Kennewick Man. Sacred items and objects of cultural patrimony held in private collections in this and other countries are, moreover, not covered in the act, which addresses only institutions receiving federal funding.

Native American activism around treaty rights, land, and religious freedom took its initial energy from urban communities where diversity of tribe, class, education, and experience provided significant fuel. Action was focused, however, on tribes and reservations considered to be the locus of native identity and community. By the 1980s, the integration of an urban-reservation social system became clear to Native Americans, if not to the government, which continued to insert a wedge between reservation and urban communities. Indian Country expanded: gaming moved off reservations and into Duluth, Detroit, Milwaukee, and other cities. Tribes set up satellite offices in urban communities, and several included representation on the tribal council for off-reservation members. Treaties clearly never stipulated Native American identity nor recognized it as synonymous with reservation residence: the reservation-based wedge began to lose its grip.

Throughout the quarter of a century between Alcatraz and NAGPRA, and beyond, treaty rights, land, and religious freedom were frequently and signifi-

cantly understood to intersect or even coincide. Modalities of social action have included silence, education, peaceful demonstration, civil disobedience, legal action, economic development, and environmental protection. While Native American social movements are clearly encouraged and influenced by issues and modes of activism in other ethnic communities, the political and legal status of Native Americans always and inevitably differentiates their issues from those of other "minorities." Native American activism, from Alcatraz to NAGPRA, whatever its specific focus or modality, has reiterated the spirit and the significance of treaties (constitutionally described as "the supreme law of the land"), advanced tribal self-determination, and established the continuing and contemporary insistence of the recognition of an American Indian presence in the greater American population.

Pan-Indianism Movement

The term *Pan-Indianism* refers to the joining together of different American Indian peoples, tribes, or nations for a common purpose. Pan-Indian movements include political confederacies such as the Haudenosaunee, or League of the Iroquois; military alliances such as those led by Pontiac and Tecumseh; and civil rights organizations such as the Society of American Indians and the American Indian Movement (AIM). The term itself is redundant, since Indian already refers generically to the native peoples of the Americas, each of whom has his own specific community, language, and traditions. Pan-Indianism is frequently used today to describe gatherings or events sponsored by and attended by a variety of Native American peoples, particularly the powwow.

Powwows are social gatherings of native peoples from one or more tribes, centered around drumming, singing, dancing, and feasting. Traditional powwows are more community-focused, usually held on tribal powwow grounds or at urban native centers; while contest powwows feature competition drumming and dancing, and often attract more spectators from outside the community. Powwows grew out of traditional dances from many different parts of Indian Country, but external forces in the nineteenth and twentieth centuries, including intertribal contact, exhibition dancing, the world wars, hobbyist participation, and the standardization of competition, helped to shape the powwow as a modern Pan-Indian movement. At the same time, many powwows retain specific regional or tribal elements.

The Indian Removal Act of 1830 began the forced relocation of eastern tribes to Indian Territory, west of the Mississippi River. Under pressure from expanding American settlements, other tribes began moving westward. Shifting into new territories meant increasing contact with other native peoples. The pace of intertribal borrowing accelerated from subsistence techniques to spiritual movements. Dance complexes were exchanged, and by the late 1800s, the war dance, grass dance, and drum dance had spread throughout the Plains and Great Lakes.

Indian boarding schools were another avenue for intertribal contact. The federal government established schools, removed Indian children from their families, and brought them together. Students from many different tribes were thrown together and began to interact. They were not allowed to speak tribal languages, and English became the *lingua franca* of the boarding schools, making intertribal communication easier. Taken from their homes and required to learn a new language and culture, students formed strong emotional ties with fellow students, which fostered an overall "Indian" ethnic identity.

By the late 1800s, native tribes had been brought into the reservation system. No longer a threat to expanding white settlement, they became objects of curiosity. White showmen and entrepreneurs recognized the potential entertainment value in exhibitions of native dancing and began recruiting Native Americans for participation in entertainments for white audiences. Gloria Young chronicled the rise of the Wild West shows in "Powwow Power: Perspectives on Historic and Contemporary Intertribalism" (1981). Wild Bill's Wild West Show, the Pawnee Bill Historic Wild West Exhibition and Indian Encampment, and Comanche Bill's Wild West Show toured the United States and Europe. Native Americans from many different tribes participated, sharing their dances and learning from each other.

World War I and II influenced the development of the Pan-Indian powwow in several ways. Native Americans who served in the military came in contact with native peoples from other areas, creating new intertribal contacts. Friendships begun in the military continued after the wars, with intertribal visiting and sharing. Dances and songs shared by soldiers became part of the developing powwow repertoire. Returning veterans from both wars were honored at celebrations

At a powwow in Peshawbestown, Michigan, on May 28, 2000, Chris Bussey, a member of the Grand Traverse Band of Ottawa and Chippewa Indians, performs a ceremonial dance. An ancient tradition of native peoples, powwows are intertribal gatherings that feature music, dance, storytelling, and contests. *(AP Wide World Photos)*

in their home communities. Traditional war songs and dances were revived to acknowledge the deeds of Native American soldiers in World War I. New songs and dances were borrowed or created and added to the existing traditions.

White interest in native culture also contributed to the expansion of the powwow. As William K. Powers has documented, beginning in about 1900, American Indian "hobbyists" emerged as a group of non-natives interested in Native American culture, particularly dancing and singing. The Boy Scouts, Girl Scouts, Indian Guides, Camp Fire Girls, and other youth groups focused on outdoor activities and native crafts and lore. Some adults continued this interest, giving public presentations of native dancing and costumes, and sometimes participating in powwows. Hobbyists leaned toward Plains-style dress and dance, contributing to a Pan-Indian flavor at powwows.

Many scholars mark the beginning of the modern powwow in the 1950s, with the introduction of competition and standardized categories in which dancers compete. Categories for contests include men's traditional, grass and fancy dances; women's traditional, jingle and fancy shawl dances, and junior or children's categories. Prize money can be substantial, particularly at large powwows with several hundred contestants. Even in traditional powwows, these cat-

egories have become standardized. Rather than contests, there are demonstration dances in the various categories.

Despite these substantial Pan-Indian influences, differences in powwows exist at both the regional and tribal level. Two styles of powwows are recognized today, Northern and Southern, reflecting differences in histories of intertribal contact. In the Northern Plains, reservations are more isolated, and so intertribal exchange has been slower than in the South. In the Southern Plains, exchange has been more prevalent, particularly reflecting the influence of southeastern tribes removed to Oklahoma. Northern-style drums usually have four to six singers, who sing at a higher pitch than Southern singers. Southern drums have more singers, as many as ten or twelve. Northern-style traditional dancers more often wear buckskin and furs, while Southern-style traditional dancers tend to wear cloth shirts and dresses.

Today, many powwows emphasize tribal elements in language, dress, dance, and community recognition. As Anya Peterson Royce pointed out in *The Anthropology of Dance* (1977), as native peoples have worked to revive their cultures, they have incorporated their own traditions into the Pan-Indian powwow. The invocation at a powwow is almost always given in a tribal language, most often in the language of the host tribe. Individuals who speak their tribal languages are in demand for powwow blessings. Dancers seek to incorporate stylistic elements that mark their tribe into their powwow outfits, particularly in traditional dance styles. Iroquois men dancers incorporate their traditional headdresses, *gustoweh*, with specific numbers and placement of feathers to denote membership in one of the Six Nations of Iroquois. Seminole women dancers wear the distinctive patchwork dresses, with multiple layers. Ho-Chunk (Winnebago) women wear ribbonwork decorations on their cloth dresses, in a style known as Ho-Chunk Applique. The Ho-Chunk people have even created a new contest category just for this style of dress.

Powwows serve as an important gathering place for native peoples, a coming together of the community. Particularly in urban areas, powwows can be a way to bring a diversity of tribes together, as described by Joan Weibel-Orlando in *Indian Country, L.A.: Maintaining Ethnic Community in Complex Society* (1999). However, as examined in *Powwow: Native American Performance, Identity, and Meaning* (2003), edited by Luke Eric Lassiter, powwows can and do reinforce and revitalize specific tribal traditions, in addition to strengthening a sense of shared purpose and identity among Native American peoples.

Sovereignty and the Self-Determination Movement

As the twenty-first century unfolds, indigenous people will have to struggle against the same forces that wreaked havoc on uncounted numbers of their cultures, both in the Americas and throughout the world, during the last 500 years. Just as monocultural agriculture can be threatened by a single pathogen, a social monoculture often lacks the diversity and flexibility needed to survive in an uncertain and quickly changing world. So, given the unique worldview of each indigenous culture, Native Americans will be working to preserve each and every culture and each and every bit of knowledge that has been assembled within these cultures over thousands of years. The major thrust of their efforts to survive as intact cultures will be the assertion of their sovereignty and their inherent right to self-determination.

Of course, preserving cultures will be a futile effort if industrial societies render the planet as unlivable. Therefore, indigenous societies will focus much of their future efforts on educating the dominant society as to the necessity to maintain a livable planet for those generations yet unborn.

Environmentalism

The popular culture belief that indigenous people are natural conservationists is indeed based on their connection to the land, but indigenous people did not survive and thrive on this planet by conserving its resources. Instead, they figured out how to utilize and change the natural environment so that it would not only benefit those alive at the time, but also "improve" the existing resources in order to ensure their availability for future generations. So we see a tremendous movement today by indigenous people to continue to live in harmony with the planet as human beings have done for all but a brief period of our existence on this planet (that is, since the Industrial Revolution).

Such environmental philosophies are embodied in an indigenous worldview, which, in turn, is embodied in Native American languages. So, the next 500 years will see a movement to revitalize tribal languages, together with the cultures and worldviews that are embodied within those languages. This is a critical time in human history. Of the thousands upon thousands of world languages extant in 1492, many thousands have already been lost; and of the 6,000 to 7,000 remaining in the world today, it has been estimated that half of these will not survive into the next century. Only a few languages indigenous to North America are expected to be among those that survive, so the work of tribal people struggling to maintain the cultural workings of their language and worldview hovers on the edge of desperation. It is a huge challenge, made even more difficult by the ubiquitous nature of Western culture and its influence on individuals, cultures, and societies around the globe.

Although cultural survival is embodied within the Native American languages and worldview, the modern political world also demands that Native Americans fight to maintain what vestiges of sovereignty they have been fortunate enough to retain. In the United States, the fact that American Indian tribes signed treaties with the government is an implicit recognition of their sovereign status. Canada's constitution recognizes the "inherent rights" of Aboriginal people, although the definition and interpretation of those rights (and who is and who is not "Aboriginal" in both the American and Canadian context) are always subject to judicial review.

Of course, sovereignty is only as valid as it is accepted by other sovereign peoples, and the record all over the world has not been good for indigenous people. Although the United Nations has recently set up a forum for indigenous voices, not one of the United Nations 191 member-states is representative of any indigenous peoples—they are truly "stateless" and virtually without a voice in world affairs. With the world's political organization based quite simply on the nation-states that grew as a result of European

Nita Gonzales (seated, left) of Escuela Tlatelolco, Glenn Morris (seated, right) of the American Indian Movement, and members of the Transform Columbus Day Alliance gather on the steps of the Colorado State Capitol Building in Denver on October 5, 2001. The group, which represents more than eighty community-based organizations, opposes traditional celebrations of Columbus Day and seeks alternative ways to commemorate the first encounter between Europeans and Indians in 1492. *(AP Wide World Photos)*

colonization and domination of indigenous peoples, we can expect that this struggle will only intensify as our "global village" shrinks in size and as the world moves closer to a true monoculture—which will be "Western" and "modern" to be sure.

Rights to Resources

The survival of a livable planet, sovereignty, and the struggle against cultural genocide are obviously global issues, but there are some more "local" issues that should be recognized as important for the survival of future generations. Water rights in the Western United States are one of those critical, local concerns, as indigenous tribal rights are often set aside in favor of individual "rights." In the case of water in the West, Native American tribes are struggling to regain rights to waters that were, decades ago, "allocated" to various farming and industrial interests in violation of treaties. This is not merely one parochial interest trumping another parochial interest, but rather a struggle to see which worldview will prevail—that of native people or the "water as a commodity" view of the dominant society.

As the tribes of the Western United States struggle to regain their rights to their own resources, Canada may provide some guidance on where Aboriginal people are going in their continuing struggle for self-determination. Canada's Constitution contains this clause: "The existing aboriginal and treaty rights of the aboriginal peoples of Canada are hereby recognized and affirmed" (Section 35[1]). This clause gives the Aboriginal people of Canada constitutional protection that their counterparts in the United States do not enjoy. Of course, just as in the case of a unilateral assertion of sovereignty, aboriginal rights are only those that can be fought for and won in the Canadian court system.

In a famous Canadian Supreme Court case, *Mitchell v. MNR* (2001), a chief of the Mohawk asserted an aboriginal right to bring some goods for personal use and trade with other First Nations people into Canada without having to pay duty. This right to bring goods across the border duty-free has been a long-standing concern for native people all along the U.S./Canadian border, and Chief Mitchell's case was just one more in a very long string of cases that all refer back to Jay's Treaty (1794) where the right of duty-free passage was expressly stated—"nor shall the Indians passing or repassing with their own proper goods and effects of whatever nature, pay for the same any impost or duty whatever" (Article III).

Although Chief Mitchell won in the lower courts when they agreed that he had a constitutional "aboriginal right" to bring a small quantity of personal goods into Canada from the United States, the Canadian Supreme Court ruled against him, stating that it is the sovereign right of nations to impose import duties and that, therefore, it would be an abrogation of Canadian sovereignty to allow anyone—including Aboriginal people—to abridge that right. So, for the immediate future, the struggle of Canada's Aboriginal people will be to test the limits of their constitutionally protected "aboriginal and treaty rights."

Another very important feature of the Canadian Aboriginal experience is the fact that Aboriginal people in British Columbia have no historical treaty relationship with the government, either with the

Crown or with provincial authorities. The first of these "modern" treaties was negotiated with the Nisga'a people and ratified on April 13, 2000. It gives the Nisga'a sovereignty over 2,000 square kilometers and a degree of self-government that will be the precedent for other First Nations peoples across Canada as they negotiate modern agreements with Canadian government officials. This, of course, not only is an agenda of those Aboriginal people in Canada, but will serve as a model for Native Americans in the United States as they assert their rights.

Federal Recognition and Casinos

Although there are over 550 federally recognized tribes in the United States, there are over 200 more that seek federal recognition. Federal recognition allows tribes to enter into a government-to-government relationship with the United States. The effort by tribes to gain federal recognition is a process that has been going on for many decades. Some tribes were denied recognition during the Depression when the government simply couldn't afford to recognize any more tribes, so their applications have been "pending" since the 1930s. For other tribes, the effort to gain federal recognition is a more recent phenomenon, fueled in some cases by the desire to obtain official recognition in order to open a casino. Casinos are often seen as the means whereby tribal people can achieve a degree of economic well-being that has been denied to them by centuries of exploitation and neglect by the dominant society. Of course, gaming is only one of the economic areas that tribal people are hoping to exploit in order to bring themselves out of the abject poverty that many have faced for a long time—and successful casino operations can only be mounted in areas that have a population large enough to support them, making gaming an option that is not available to many of the poorest, rural tribes.

Casinos and other economic enterprises are only one element of the huge puzzle that indigenous people are struggling to piece together in order to achieve even a minimal level of self-sufficiency. Obviously, the "wardship" status of native people severely restricts their ability to provide services that adequately meet the needs of their members. As can be seen by any discussion of the last 500-plus years of government "reform" efforts, these efforts have often not borne any fruit that is worthy of being emulated and repeated. So the dilemma facing many Aboriginal people both in the United States and in Canada has been to determine how to balance their absolute need for government assistance—often mandated by treaty—with their strong desire to escape from the yoke of dependency, which is engendered by that very same life-support assistance.

Economic Survival

So while Aboriginal people on both sides of the U.S. and Canadian border face different governments and different dependency relationships to those governments, the one thing that all will agree upon is the need to escape the grinding poverty and hopelessness that large numbers of native people face. It's not because they live in resource-poor areas—although many do—but more because those resources are generally not being managed for the benefit of the tribe from whose land these resources are being extracted. Perhaps the most egregious example of the U.S. government failing in its responsibility to Native people can be seen in the unfolding scandal over the government mismanagement of tribal "trust funds." These trusts are established to manage the many billions of dollars the government collects on tribes' behalf (often in the form of lease revenue or royalties from resource extraction activities on tribal lands). The scandal that is now unfolding is pointing at the inability of the Bureau of Indian Affairs to account for over $2 billion in just a twenty-year period (from 1973 to 1992). No one can even estimate how many more billions have disappeared over the last 180 years (the Bureau of Indian Affairs was established in 1824).

But the economic sustenance provided for by even the admittedly mismanaged trust funds was often all that was available to many of the poorest of tribal people. And it is difficult to think about how to achieve economic self-sufficiency when you're not sure where your next meal will come from. So, the very strong movement toward economic self-sufficiency that is being promoted by many tribal leaders is often tempered by the reality that governments can—and often do—implement programs that will adversely affect the people that these same programs are ostensibly designed to help.

The road to self-sufficiency that many tribes will be traveling in these next 500 years will be found to be full of potholes with numerous detours along the way—many down blind alleys. But Native American people are still going to travel those back roads because their cultures demand that they look to providing for future generations. The dual goals of self-sufficiency and self-determination can be viewed as simply the two sides of the same coin. It seems that these are the challenges of native people everywhere. As the world moves closer and closer to a universal

monoculture based on the "American" standards of *individual* "democratic" and economic rights, more local and "parochial" concerns seem to be moving to the fore.

For the long term, we may hope that people are discovering that a consumer-driven need for instant (and private) gratification doesn't make for a culture that sustains the very human need to be a *social* creature (especially when contrasted to the media-derived "need" to be an *economic* creature). In the next 500 years, people may discover what indigenous people have known all along: that we need each other to survive and that the "meaning of life" (if such a thing can be examined) can be explained as a need to live in harmony and balance with all of the elements of creation, not just those that can be bought and sold at a profit, and, of course, with each other. Perhaps it's not too late. Perhaps the way that worked so well for over 2 million years and was only abandoned in the last 200 will once again provide people with what they need. Perhaps all that is needed for the next 500 years is the example provided by indigenous people, who have survived this last 500 years with their cultures, if not unscathed, at least still alive. The struggle then is to maintain (or, in some cases, regain) the cultural knowledge that Native Americans have developed over time and to maintain that worldview as embodied in their languages.

Identity, Mascots, and Playing Indian

At the 1754 Albany Congress held near the Mohawk Nation in Albany, New York, Benjamin Franklin stuck a feather in an Englishman's cap and called him an American by making direct, and allegorical, reference to the Iroquois Confederacy in the drafting of the Albany Plan of Union. When Franklin dipped his quill into the inkwell and wrote the words "Sachem and Grand Council" as a way of describing a union of thirteen English colonies, in this famous precursor to the Articles of Confederation and the U.S. Constitution, he symbolized a new national movement. At this early stage of revolutionary sentiment, Franklin's words marked the beginning of what would become an age-old association with the stereotypical image of the American Indian. Thereafter, the American Indian, converted to a standardized and usable image, became an emblem of American identity and the origin of the stereotypical Indian mascot and logo.

In 1773, nineteen years after the Albany Congress and on the eve of the American Revolution, the Sons of Liberty paid tribute to this earlier effort at union by dressing as Mohawk warriors and throwing English tea overboard into Boston harbor. On that glorious oak stage, for the world to see, the Boston Tea Party participants identified themselves as Mohawks as a symbol of their American background and patriotic protest. With this purposeful display, they directly associated themselves with Benjamin Franklin's Albany Plan of Union, the first intellectual discourse on federal representative self-rule and confederation. The Sons of Liberty first appeared in the 1760s as an organization created in opposition to "taxation without representation," the Stamp Act, the Quartering Act, and other oppressive legislation.

At the Boston Tea Party, men dressed as and played Indian for symbolic, and revolutionary, purposes; they had no desire to become "savages" themselves. The Boston Tea Party "Mohawks" planned no subterfuge to disguise their identities. They fully expected arrest and trial. In fact, they avoided the pitfalls of savage behavior, as they perceived it, by practicing peaceful civil disobedience and dramatic and symbolic protest. A broadside issued in Boston in 1774 and entitled "Tea Destroyed by Indians" emphasized this point: "Ye GLORIOUS SONS OF FREEDOM, brave and bold, / That has stood forth—fair LIBERTY to hold; / Though you were INDIANS, come from defiant shores, / Like MEN you acted—not like savage Moors." Even though war paint and war clubs do appear on the surface as implements of savagery, the Boston Tea Party "Mohawks" demonstrated to the world that they were not savage warriors but civilized men making a symbolic point. They did no harm to anyone, nor did they destroy property other than the hateful tea.

The Sons of Liberty and Its Descendants

The Sons of Liberty created the archetypal model of invented American Indian ritual, warrior look, custom, and caricature. With the image and symbol of their invented Indian, they made their European social antecedents decidedly "American." They did not reject their Western civilized origins. To convert socially accepted secret organizations of European origin, like the society of Free and Accepted Masons, to a uniquely American version, or to invent new ones with an American flavor, the image of the Indian served the American patriots well. Often, a weathervane, fashioned in the form of a Native American archer, identified a secret meeting place, usually a barn, where Sons of Liberty patriots would gather. Like the Freemasons, the Sons of Liberty adopted elaborate rituals, but instead of creating rituals echoing and paying homage to ancient Egypt, the Americans invented rituals echoing the culture, dress, and manners of the American Indian. They donned an Indian warrior guise, sang Indian songs, and smoked an Indian pipe of their own invention. Tar and feathering, tomahawks embedded in entranceways, and the menacing presence of Americans dressed as In-

dians at doorsteps signaled to their enemies their patriotic and serious intent. They acted in a controlled savage manner against their English opponents, but they still believed in their civilized and European origins. Because they communicated an American identity rather than a Mohawk one, the Sons of Liberty sought to portray a generic, standard image of an American Indian with very little relation to any existing tribe.

According to Sons of Liberty lore, the Delaware chief, Tammany, was their source of indigenous inspiration. Tammany, or Tamanend, was believed to be the Delaware "king" of the Lenni Lenape Confederacy, which was a precolonial power occupying the territory later known as Pennsylvania. His legendary life and history are purported to be an invention of the Sons of Liberty, though some aspects of his life are supposedly based on fact. R.G. Horton writes in his *History of Tammany Society, or, Columbian Order* (1865): "The Sons of Liberty were determined that America should not be behind other countries in the illustrious character of her productions, and hence they invented the legendary accounts of the distinguished chieftain." These legendary accounts told of a proud and brave leader of native people who was vigorous in mind and body. And though he "devoted himself to the acts of peace," he waged war on the "evil spirit" that would deny his people liberty and happiness. To colonial Americans, these notions of liberty through self-determination and defended with a warrior's strength were powerful and admirable concepts. The sanctity of these notions was embodied in the very person of Chief Tammany, the fierce warrior hero who would not submit to a loss of his liberty or of his rights. Because of these qualities, and the fact that he was a product of the American environment, he was "without question, one of the most distinguished red men who ever lived"; therefore, he was ideally suited to symbolically represent the revolutionary cause. "Liberty" was a word that became synonymous with the word "Tammany" and was thought to be a direct translation of the Delaware word and name of the great chief. According to R.G. Horton, "Their watchword was 'Tammany and Liberty.' " Not surprisingly, the Sons of Liberty were often called the Sons of Tammany.

Once the association with the American Indian was clearly established as symbol and mascot, the newly formed American government would also honor their war heroes with medals bearing this image, or logo. During the American Revolution, for example, Anthony Wayne, for his retaking of Stoney Point, and Daniel Morgan, for his heroism at the Battle of Cowpens, were each awarded a medal that displays an American Indian warrior with a quiver of arrows bestowing a wreath of *laurus nobilis* to a white gentleman dressed in a military uniform of the Revolutionary army. Clearly, the association is symbolic. The civilized gentleman honored by and associated with the noble savage is the meeting of the two halves of American identity. The minting and the granting of these peculiar medals show the importance of American Indians as emblems of independence and democracy. The most famous and enduring examples are the U.S. coins that depict the head of an American Indian warrior, a tradition carried on with the issuing of the Sacajawea dollar coin in 2000.

After the Revolution, the Tammany Society and the Society of Cincinnati would continue the prerevolutionary traditions of the Sons of Liberty; they were organizations that incorporated "classical" history as myth as well as "Indian democracy." They, too, would adapt features of American Indian warrior life into their organizations and rituals. In 1830, the Improved Order of Red Men was formed along similar lines. This order claims to be the oldest secret society of purely American origin. The Improved Order of Redmen did not admit "real Indians" as members. "Improved" meant that members had to be an American of *European* descent. American meant those males who could trace ancestors to the American colonial experience and to the American Revolution. Civilized Americans, in this sense, "improved" the natural condition of the positive qualities of the savage redman. They, like the Sons of Liberty, believed they were the true sons and inheritors of North America who would, in a predestined manner, replace the original inhabitants.

The most famous descendants of the Sons of Liberty were the Sons of St. Tammany; they were officially known as the Tammany Society or Columbian Order. They were organized in 1789 in favor of democratic ideas and principles as opposed to monarchical and aristocratic ones. As Marcus Jernegan notes in his study "The Tammany Societies of Rhode Island" (1887), they were strictly a political organization rather than a hobbyist or honor society. Their original purpose was to perpetuate and protect principles that "grew out of their belief in liberty, representative government, social and political equality." To symbolize this purpose, they adopted the banner of the spirited patriot soldiers and zealous Sons of Liberty. Jernegan adds: "It is usually maintained that certain troops from Pennsylvania under Washington's command first inscribed St. Tammany on their banners and dubbed him a saint." Tammany, the American Indian warrior, phi-

losopher, statesman, and patron saint of America, served as the emblematic model for native warrior virtues.

Games and Rituals

After the American Revolution and once native populations were killed or otherwise displaced, "playing Indian" became a common game among children of all generations, past and present, to the point that it became a rite of passage of sorts. Young boys will often play with toy forts, toy Indian warriors, toy cowboys, and toy cavalry. These games provide a way for children to experience something about the hardships of settlement and survival in the North American continent, the invention of the United States, and Manifest Destiny. Often the play centers on the fighting of American Indians in heroic and romantic settings. Killing them in mock "cowboy 'n' Indian" fights, the role playing of "braves or chiefs," or even the practicing of native skills, like canoeing, archery, stalking, and scouting, can teach children something about the myth of the American frontier and its place in American history.

In Massachusetts, around 1853, William Wells Newell, a collector and analyzer of games played by American children, remembered how much native tribes occupied the imagination of young Americans. He recorded numerous American Indian games played by boys and girls alike. Such games of the early 1800s would be adapted and played by generations of American children in the years after. Games are rituals, and the games played by children are often unique and revealing of subliminal cultural beliefs and practices. Once real Indians were no longer a threat, American adults and children alike were free to imagine their own versions of fantasy warriors for play and for more utilitarian purposes as well.

In the early 1900s, Ernest Thompson Seton's handbook, *The Birch-bark Roll of the Woodcraft Indians*, and his other books, including *How to Play Indian* (1903), would carry on traditions of playing American Indian. Although Lord Baden-Powell of England wrote the first Boy Scout handbook, he has acknowledged that most of its organizational content was adopted from Seton's *Birch-bark Roll of the Woodcraft Indians*. Baden-Powell merely eliminated reference to Native Americans and adopted a more conventional military uniform for his boys. Nevertheless, in 1910, when the Boy Scouts of America (BSA) was formed in New York City, the American Indian was considered integral to America's scouting movement. Seton's *Boy Scouts of America: A Handbook of Woodcraft, Scouting, and Life Craft* (1910) was written as the American version of the British Boy Scout handbook. American heritage and American ideals had to be made a part of the organization, handbook, and movement. American Indians are especially highlighted in the BSA's honor society, called The Order of the Arrow. Within a few years after 1910, the BSA had in itself become an American tradition. By 1926, according to the BSA handbook, the popularity of this movement had been confirmed, for over half the men attending college at that time had been Boy Scouts.

Logos and Mascots

Paralleling the rise of the Boy Scout movement was the rise of the use of images of American Indians as commercial symbols that became very popular eye-catchers because they are subliminal reminders of American heritage and identity. As trademark designs, American Indian warriors mark the product as authentic, American, and original. From the late 1800s to today, Hiawatha Corn, Wampum Canned Goods, Bow-String Rubber, Cherokee Coal, American Copper and Cable, Calumet Baking Powder, American Baking Powder, Red Warrior Axes, Savage Arms, Red Cloud Chewing Tobacco, and Big Chief Sugar, to name a few, have successfully used images of American Indian warriors to sell and promote their products.

By the 1950s, names, war weapons, cognomens, and caricatures suggesting American Indian warriors or culture were appearing not only as logos for consumer products but as logos and mascots for sports teams. In the arena of sports, team names like Chippewas, Redskins, Indians, Chiefs, Braves, and Warriors reveal a connection to Americanism and the invented Indian of Revolutionary times. The display of the invented Indian as a logo or a mascot to a hungry spectator culture eager for these historical and contemporary distortions stands for, and symbolizes, the ultimate appropriation and conquest of the North American continent. The use of American Indians as logos and mascots shows the end development of an emblematic and readily consumable native warrior guise. Spectators and players recognize the symbolic qualities of the indigenous identity. The practice of the so-called tomahawk chop at Atlanta Braves baseball games is yet another example of this symbolic use.

With the seemingly endless visual, oral, and dramatic representations of the invented Indian in contemporary society, Americans find it difficult to sort through the pseudo-Indian fabrications and art fakery to find some sense of authenticity that is not steeped in romanticism and nostalgia. This is especially evi-

Carrying a poster of various sports team Indian mascots, Jan Saiz of Madison, Wisconsin, and Hugh Danforth of Oneida, Wisconsin, denounce the stereotyped images as racist and demeaning at a demonstration in Madison on March 22, 2002. The mascot in the center represents the Cleveland Indians, one of Major League Baseball's oldest teams. *(AP Wide World Photos)*

dent when you consider the lack of attention and interest in the historical place and role of contemporary Native Americans in modern society. As can be easily ascertained, Americans want to keep Indians in the past, dressed in war paint and moccasins. Examine some of the images found on the wrappers and packaging of products sold at your local grocer, like *Big Chief Sugar*, or examine closely some of the American Indian logos pasted to the helmets and caps of high school, college, and professional sports teams to confirm this point. Not many Native Americans are depicted in graduation caps and gowns, grasping their diplomas in eager anticipation of what the future holds for them. Although dressing up like an American Indian warrior, or accepting a team's logo that depicts one, may be symbolic of what it means to be an American, it is at the same time an ominous expression of prejudice and racism because its adherents do not realize that what they do is harmful to current-day Native American people. However, the majority of Americans believe the use of these images is harmless and, ironically, respectful.

Apart from the fact that the Sons of Liberty were predisposed to use deadly force, their behavior—the dressing up, the war paint, the cult of violence—had much in common with the modern-day sporting event, especially with the use of American Indian mascots and logos, and the "dressing up" of spectators. Contemporary Americans, however, are befuddled over questions concerning the "proper" or "improper" use of American icons such as an image or caricature of an American Indian. Unlike the Boston Tea Party Mohawks who knew the difference between the Mohawks they depicted and the real Mohawks they fought and killed on the frontier, fans and players in modern times do not understand the distinction between the "Indian" invented by the Founding Fathers and real-life, flesh-and-blood, natives who signed treaties with the United States. On the other hand, Colonial Americans, the Sons of Liberty in particular, understood the origin of the native people they honored and Benjamin Franklin realized that the use of American Indians as symbolic devices had historical significance. Over the course of 200 years of American history, this historical connection has diminished to a litany of unanswered questions and has dissolved into the vagaries of mass culture.

In other American art forms—literature, sculpture, paintings, and photography—and in forms of American popular culture—dime novels, Wild West shows, movies, and television—the image of the American Indian endures with ever-increasing popularity. In this new millennium, corporations, universities, and grade schools throughout the United States still adopt the visages of the invented Indian for use as trademarks, logotypes, and mascots. These images of Indians, which often symbolize corporate identity and school pride, affirm the importance of the invented Indian and of playing Indian in American history and culture. The image and likeness of the native warrior has certainly become an enduring feather stuck in Yankee Doodle's cap but has little to do with real Native Americans themselves.

Indigenous People and Environmentalism

The Indigenous environmental movement grew steadily throughout the last decades of the twentieth century and continues to grow in the twenty-first. Its growth correlates with the resurgent native religious systems that are built on earth-centered values: most aboriginal cultural groups have deeply rooted ecological traditions, even though they vary widely in the specifics of their religious beliefs. Traditional teachings generally refer to the interconnectedness and sacredness of all organisms within the web of life; the importance of respect for the Earth Mother; and the understanding that any damage done to flora, fauna, and the land itself affects all living things, including humankind, because all things are interconnected. Traditional native belief is built on a "theology of place" in which people do not separate themselves from the land: to that end, Gregory Cajete quotes an elder's explanation that "This is the place that made us." The religious connection to the earth, as well as a history of complicated and protracted land conflicts, may explain the focus of the most visible and publicized contemporary environmental movements. In recent decades, aboriginal activism has been predominantly focused on protecting traditional lands from development, stopping destructive land use, reclaiming lost land rights, and battling against widespread environmental racism. Environmental racism is broadly defined as economic and political policies that disproportionately expose discrete communities of color to dangerously poor environmental conditions, negatively affecting public health and safety. The Economic Justice movement arose as an answer to the devastating impact which systematic exposure to toxic waste, highly polluting mineral extraction, environmental degradation, and economic divestment were having on communities. (For more information on Environmental Justice, see Robert A. Bullard's *Dumping in Dixie: Race, Class and Environmental Quality* [2000] and *Unequal Protection: Environmental Justice and Communities of Color* [1994.])

Environmental Activism

It is useful to think of the history of native peoples since the arrival of Christopher Columbus as an ongoing struggle for the right to occupy and determine the use of land. The continuing conflict over natural resources results from very different views of what land is and what it is for. Euro-American environmental policy has been built on the ideas that the human is the child of God, land is a commodity, and natural resources are gifts from God for people to consume. Most indigenous cultures believe that they are part of the land and that they have an enduring religious/ecological obligation to protect it—and therefore protect themselves. As a result of this conflict, when there was a question over who would retain possession of any particular area, Euro-American economic needs (such as grazing lands and commercial fishing) nearly always outweighed aboriginal cultural heritage (roaming buffalo herds and summer subsistence fisheries). In most situations, the governmental body would reallocate natural resources as it desired, and the native community was relocated, decimated, or prevented from continuing their traditional practices. Native peoples continue to view environmental conflicts as attacks upon culture, religious rituals, and their entire cosmological system.

There are other ways in which indigenous activists are different from other parts of the environmental movement. In contrast to large-scale organizations such as No Nukes, the Nature Conservancy, and Greenpeace, contemporary native environmental activists have often been weakened by their relative isolation. They frequently come together as a grassroots response to specific, localized problems associated with toxic waste, fishing rights, resource extraction, and other instances of Environmental Racism. The dif-

ficulties that these organizations face are endemic to their problems. Many campaigns emerge in rural communities (such as reservations and reserves) with a specific problem, so they have less political clout and fewer sources of funding for their campaigns. They are often led by people with less organizational experience and less access to high-quality legal representation, and they have staffs that can't match the media savvy of the corporations and political bodies they challenge. Without financial resources, publicity, and wide-ranging expertise, they have had limited success in fighting their battles.

They have been aided, however, by communication channels such as the Internet, which helps to combat the divide-and-conquer strategy often used to weaken individual environmental initiatives. The Internet has enabled the maintenance of umbrella organizations such as the Indigenous Environmental Network (IEN), which coordinates international symposia and acts as an information clearinghouse for regional campaigns. Organizations such as the IEN have implemented Internet-based initiatives, significantly augmenting the small amount of mainstream broadcast media coverage with native-produced news stories across all forms of media.

Saving the Land from Developers and Polluters

The increasing numbers of activists have begun to overcome the historic limitations of the indigenous environmental movements, and today's many campaigns continue to focus on a broad range of primarily land-related issues. Among the best places to begin searching for examples of issues-based campaigns is two-time Green Party vice presidential candidate and Mississippi Band Anishnaabe Winona LaDuke's *All Our Relations: Native Struggles for Land and Life* (1999), which explains much of the root of land-use issues in native communities: "our lands are home to a wealth of resources. Two-thirds of the country's uranium; one-third of all western low-sulfur coal; and vast hydroelectric, oil, and natural gas resources are all situated on Native land." LaDuke provides primers and historical frameworks for understanding such issues as the impact of coal mining on the Northern Cheyenne. She tells how the Northern Cheyenne fought to void substantially underpriced mineral-rights contracts negotiated on their behalf by the U.S. Bureau of Indian Affairs. They have invoked federal clean air standards to protect their communities, and they have helped form an organization called the Council of Energy Resource Tribes (CERT) to aid other tribes in their negotiations with corporations and the U.S. government.

At a demonstration at the University of Minnesota on May 20, 2002, environmentalist and former Green Party vice-presidential candidate Winona LaDuke denounces gene mapping of wild rice. LaDuke and many fellow Native Americans liken the dangers of using plants for genetic research to desecrating sacred land. *(AP Wide World Photos)*

LaDuke describes the Mother's Milk Project, which advocates for the rights of the Akwesasne Mohawk people, who have been exposed to PCB poisoning in the St. Lawrence River for decades. They continue to fight for reparations and cleanup by corporations such as General Motors, Reynolds Aluminum, and Domtar. Aside from the direct impact of PCBs on individuals, the Akwesasne Mohawk have had to systematically change their diets and forego

their fishing culture, contributing to significant public health changes such as increased rates of diabetes, heart problems, and obesity. She also explains the impact of Everglades destruction on the Florida Seminole, low-level jet combat training on the Nitassinan Innu, and nuclear weapon testing and waste storage on the Western Shoshone.

The Western Shoshone have consistently opposed the establishment of a centralized nuclear waste dump within Yucca Mountain, a site that is sacred to them and has also been deemed scientifically unfit for this sort of storage. In the summer of 2002, President George W. Bush cited the $8 billion of research into the project as his main justification of its continuance. Native groups and other environmentalists pledged to continue to fight during the construction phase, which will take nearly a decade. Yucca Mountain is a particularly good example of the issues that face native peoples, especially reservations. Because of their comparative remoteness, control of large tracts of land, and long history of impoverishment, reservation lands are excellent candidates for hosting toxic dumps. When an economically destitute community is presented the opportunity to bring in millions of dollars in exchange for allowing waste sites on their lands, the overwhelming temptation is to gamble that there will be no seepage into ground water or containment leaks. Communities must choose between poverty today and the potential for illness in the future. Many are tempted to opt for the latter, hoping that they are not contributing to irreparably harming the land to which their people have historical, cultural, and religious ties.

For these same reasons, Inuit whaling and aboriginal fishing rights in the United States and Canada are continuous points of contention. As outgrowths of treaty land-rights issues, they seem to be places in which native peoples would split from the mainstream environmental movement. However, these conflicts are nearly as much about resource management and the prevention of devastating effects on commercial fishing as they are about maintaining traditional cultural practices. What often gets lost in the conversations is the fundamental difference between a permanent community engaging in subsistence-style fishing versus broad-based harvesting of a series of regions. The former helps to maintain populations, whereas the latter devastates them and moves on to the next. Among the newest issues is a growing conflict over the introduction of genetically modified wild rice to the rice fields of Minnesota. Because wild rice is a staple that the Anishnaabeg consider one of the Creator's most significant gifts, and one that must be protected and maintained, there are significant religious implications if that crop is substantially altered or harmed.

This same conflict—with the same underlying politics of land ownership and stewardship—arises in Donald Grinde (Yamasee) and Bruce Johansen's *Ecocide of Native America*: *Environmental Destruction of Indian Lands and Peoples* (1995) which adds several more cases to LaDuke's. After discussing historical approaches to the last 400 years of indigenous ecological history, they focus largely on mining and farming in Navajo country, fishing rights, and uranium mining, and they provide another perspective on PCBs in Akwesasne. Ward Churchill's *Struggle for the Land: Native North American Resistance to Genocide, Ecocide, and Colonization in Contemporary North America* (1999) provides an in-depth analysis of the relationship between aboriginal sovereignty and land issues. He includes additional perspectives on some of the issues mentioned above, and he discusses hydroelectric dams in Quebec, the Alberta Lubicon Cree's claims of cultural genocide and land misappropriation, and land wars in Navajo country. Other sources, such as Jace Weaver's *Defending Mother Earth: Perspectives on Environmental Justice* (1996) and Jill Oakes et al.'s *Sacred Lands: Aboriginal World Views*, *Claims*, *and Conflicts* (1998), further explore aboriginal world-views and environmental justice.

When looking at the broad range of abuses that native peoples are combating, often the fear becomes pervasive that all the sacred lands are being destroyed and that no fights can be won. This is not the case: there have been some successes. Perhaps the most visible recent example was led by the Gwich'in Athabaskans, who have sought to stop exploratory oil drilling in the coastal plains of the Arctic National Wildlife Refuge in northeast Alaska. In preventing the development of oil fields, they have been able to maintain the calving grounds of the porcupine caribou and protect one of the largest tracts of pristine land in the United States. LaDuke also writes of the White Earth Land Recovery Project, in which the White Earth Ojibwe of Minnesota have reacquired a portion of their traditional lands, largely through purchase. She also describes the successes of the NativeSun project, which is introducing alternative, renewable energy sources to the Hopi and Navajo communities. NativeSun hopes to empower the Hopi and Navajo peoples by ending their reliance on the

power grid and helping them to assume control of their own energy needs in a way that will be respectful to the earth and reduce pollution as much as possible.

Struggle for the West: U.S. Indian Policy from Sand Creek to Wounded Knee

U.S. Indian policy went through a number of changes from the time of the Civil War, but in almost all cases, despite the good intentions of many people, the policies were unsuccessful. American Indians were stripped of their land, their culture, and, in some cases, their very lives. In almost every case the desires of the native peoples were discounted, while the individuals struggling to help the natives thrust upon them their own personal views of what would be best.

When the Civil War broke out in 1861, many of the western tribes found the pressure that had been placed upon them was temporarily relieved, as soldiers were withdrawn to fight further east. The Five Civilized Tribes in Indian Territory found themselves caught up in the struggle between North and South as each side struggled to gain the loyalty of these strategically located tribes. The Confederacy, through the promise of more liberal treaties than the United States had ever offered, and the more active presence of agents, eventually won the support of the majority of the members of the Choctaw and Chickasaw tribes. The Cherokee, Creek, and Seminole were more deeply divided.

Inaction by the Lincoln administration and early Confederate victories on the battlefield bolstered support for the pro-Confederate factions of these tribes, and in October 1861 the Cherokee formally severed their relationship with the United States. Within a year, however, the tides of war had begun to change, and the Indian Territory became vulnerable to Union attacks. Many Native Americans who had supported neutrality or the North quickly abandoned their loyalty to the South and tried to rebuild their ties with the Union but met a cold reception.

Forced Concessions

When the war came to an end, the Union used the Five Civilized Tribes' defection to the South as justification to force new concessions from them. Each of the tribes was forced to sign a treaty that effectively cut its land holdings in half. The confiscated lands on the western half of Indian Territory would be used to create reservations for other Western tribes.

The Civil War also affected the Sioux on the Northern Plains. The Santee Sioux, who had agreed to settle on reservations prior to the Civil War, were especially affected. With the advent of war, keeping reservations properly supplied was a low priority. The lack of promised supplies combined with poor crops caused the Santee Sioux to become restless. As hunger increased on the reservation, the Sioux were forced into action. A group of natives broke into the reservation's storehouse to steal enough food to feed themselves and avoid starvation. The government and the Indian agents' continued neglect called for more extreme action. Many young warriors talked openly of attacking the whites in the area and driving them out. Abraham Lincoln's withdrawal of several units of soldiers to fight the Confederates further emboldened them. Only the dire warnings of Little Crow, one of their chiefs, kept them from taking immediate action.

The telling blow occurred in 1862 when a group of Sioux stole eggs from a party of settlers and, after a brief altercation, murdered five of them. When Little Crow was told of the event, he immediately called a council and, despite his feelings to the contrary, decided to lead a preemptive strike against the settlers of Minnesota before they could seek revenge for the murders. The Sioux rose up *en masse* and attempted to rid the Minnesota Valley of white settlers. Their key mistake came when, ignoring the advice of Little Crow, they refused to launch an immediate attack on Fort Ridgely, the only stronghold in the vicinity. As a result, when the Sioux finally turned their attention to the fort, the number of defenders had swelled considerably, having been augmented by refugee pioneers.

It was nearly a month before General Henry Hastings Sibley led a party of Minnesota volunteers and militia to defeat the Sioux in a battle at Wood Lake. The victory dispersed the natives and ended organized resistance. Many fled west to join their kinsmen on the plains, while others surrendered. A hastily held trial of almost 400 captured Native Americans led to the conviction of 303, who were sentenced to death. President Lincoln eventually overturned all but thirty-nine of the sentences. In the largest mass execution in U.S. history, thirty-eight were eventually hanged. Tensions between the settlers and the Minnesota Sioux eventually led to the complete expulsion of the native peoples from the state, and a new reservation was created for them in the Dakota Territory.

Sand Creek Massacre

In the Central Plains, the Cheyenne and Arapaho found themselves under pressure when gold was discovered in their region. For several years, the natives attacked miners and settlers who invaded their lands, alarming local Coloradoans. A group of Cheyenne and Arapaho under the leadership of Black Kettle desired peace and agreed to relocate to the area of Sand Creek. Other natives, however, continued to harass settlers and miners, hoping to drive them from the area. In 1864, Colonel John Chivington led a force of cavalry and militia to suppress the hostiles but attacked Black Kettle's band of peaceful Native Americans instead. The result was the Sand Creek Massacre, where over 100 men, women, and children were killed and their bodies were horribly and sexually mutilated. Although the carnage was widespread, Black Kettle and others did manage to escape.

When word of the Sand Creek Massacre reached Washington, D.C., there was widespread condemnation of Chivington and his actions. Many congressmen began agitating for a new policy concerning Native Americans, but the demands were necessarily set aside because of the constraints of the Civil War. A new treaty was finally negotiated in 1865 with the Cheyenne and Arapaho, as well as with the Comanche and Kiowa on the Southern Plains, but amendments to the treaties by the Senate ensured that the nations would not get the land promised by the treaties.

Militarism and Repression

Still, with the Civil War concluded, pressure mounted to establish a new policy to deal with the Indians. In December 1866, when Captain William Fetterman and eighty soldiers were ambushed and killed by a party of Sioux led by Chief Red Cloud on the Bozeman Trail in Wyoming, the need for a new policy became more urgent. After an intense investigation into the causes of conflict and the reasons for the decline of the tribes, two opposing factions emerged. One group favored peace, while the other favored a military solution. The peace faction urged creating reservations for each of the various tribes and teaching them English, farming, and the other skills thought necessary to make them productive citizens. The force faction argued that nothing less than continuous military harassment of the Native Americans, until their spirit was broken and their numbers decimated, would subdue them.

The resulting policy, often referred to as the peace policy, was actually a combination of the two. Tribes would be given individual reservations to live on and would receive subsidies and gifts to encourage them to accept their new lives. Those Native Americans who refused to settle on the reservations were to be suppressed militarily. Some tribes, realizing the futility of resistance, reluctantly accepted reservations obtained through treaties.

In 1867, a government commission met at Medicine Lodge Creek in southwestern Kansas to negotiate with the Southern Plains Indian tribes. Five thousand Comanche, Kiowa, Kiowa Apache, Arapaho, and Cheyenne attended the discussions. The treaty that emerged created two reservations in the western half of Indian Territory. One reserve would be established for the Comanche, Kiowa, and Kiowa Apache, and other would be created for the Arapaho and Cheyenne. Through a combination of gifts, promises, and threats, the commission acquired the agreement of all five tribes.

Two prominent chiefs, Roman Nose of the Cheyenne, and Satanta of the Kiowa, however, refused to sign the treaty and took their followers out into the plains. The commission, feeling that it had accomplished the majority of its goal, headed north to treat with the Northern Plains Indians. At Fort Laramie, in 1868, the commission gradually negotiated and signed treaties with the Crow, Northern Cheyenne and Arapaho, and the Sioux. The treaty created the "Great Sioux Nation" and called for the expulsion of all U.S. military from the region. Even the recalcitrant Red Cloud, who had been holding out, eventually signed the treaty.

Many individual Native Americans refused to accept reservation life and continued to travel across the plains to hunt the buffalo and, at times, cause depredations. The army had the impossible task of policing the entire plains and hunting down these

"nontreaty" natives and forcing them to submit. Corruption by government officials exacerbated the problem. Indian agents received huge sums of money to keep the native peoples well-provisioned and to pay them subsidies, but often used the funds to purchase inferior-quality supplies or spoiled food while pocketing the savings. Increasingly, natives fled the reservation to live the freer life on the plains where they could obtain their own supplies and fresh buffalo meat.

In late 1868, General Philip Sheridan launched an extensive winter campaign to subdue the natives on the Southern Plains and force them to stay on their assigned reservations. One detachment pursued warriors into the peaceful encampment of Black Kettle, the survivor of the Sand Creek Massacre, who had scrupulously obeyed the provisions of the Treaty of Medicine Lodge Creek. The soldiers attacked the village, killing over 100 warriors, including Black Kettle. By early 1869, Sheridan's campaign of total warfare had killed many hostiles and nonhostiles, but concluded with the confinement of the remaining members of the tribe on their reservations.

The death of Black Kettle and other peaceful Native Americans led Congress to create the Board of Indian Commissioners that same year. The board was led by Christian leaders, determined to win over the natives through missionary programs. Although the board members no doubt believed that they were serving the best interests of the tribes, they refused to take into consideration the Native American beliefs or customs and insisted that they convert and accept Christian ideals. Interdenominational rivalry and resistance from government officials bent on profiting from the natives' plight caused most of the board's recommendations to be rejected. The board did abolish the treaty system, however, as this idea fit well with Congress's plans. After 1871, Native Americans would no longer be considered members of a nation or tribe but wards of the federal government. Within a decade, the original members of the board had been replaced with individuals more malleable to the desires of Congress and government agencies.

Expropriation and Annihilation

Meanwhile, the army had realized that as long as the buffalo roamed the plains, the natives could not be forced to stay on the reservation. In fact, many treaties had granted the Native Americans permission to leave the reservation to hunt buffalo to supplement their food supply. Any time they felt abused or mistreated, or sometimes because they simply wanted to return to their old lifestyles, groups would flee the reservations to live the free life on the plains, which supplied them with all the necessities of life.

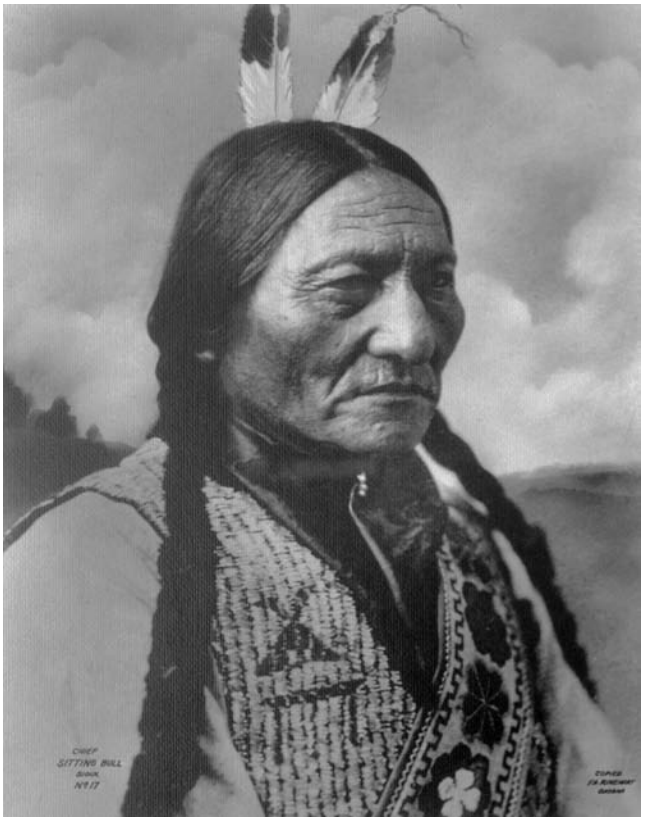
Prior to the 1870s, buffalo had been hunted sporadically by hunters hired by railroad companies to supply cheap meat for workers, or by sportsmen for the thrill of the kill. But by 1871 eastern industries discovered a commercial use for buffalo hides, and professional hunters joined the action. Within a decade the buffalo herds were decimated to the point of near extinction. Indian hunting parties rarely if ever encountered buffalo on their off-reservation jaunts and now had little choice but to accept the dismal life on the reservation.

As the organized buffalo hunts began, and the Native Americans saw their way of life being obliterated, Indian raids flared up once again. In 1874, a large party of Kiowa, Comanche, and Cheyenne attacked a party of buffalo hunters at Adobe Walls in the Texas panhandle. Although the hunters held off the attackers, their eventual withdrawal after the fight encouraged more natives to join the uprising. Soon the Southern Plains in Texas, New Mexico, Kansas, and Colorado were swarming with native warriors intent on driving the buffalo hunters out. General Sheridan was once again called upon to subdue them in what would become known as the Red River War. Sheridan launched a multipronged invasion of the area and ruthlessly pursued the Native Americans through the winter of 1874–1875, burning camps, destroying supplies, and killing or capturing natives. One by one, the tribes surrendered. By the summer of 1875, the last holdouts, a band of Comanche, surrendered at Fort Sill.

Once the war ground to a halt, the government hoped to ensure there would be no further outbreaks by imprisoning a number of prominent chiefs. As further insurance, additional native leaders and prominent warriors were exiled to Florida, where they remained until finally released in 1878. By that time most of the southern tribes had realized the futility of resistance and reluctantly accepted reservation life.

Aggression and Resistance on the Northern Plains

On the Northern Plains relations had been relatively peaceful. The powerful Sioux nation was effectively divided into two groups. One group led by Chiefs Red Cloud and Spotted Tail lived on the Great Sioux Reservation in South Dakota. The other group roamed the unceded lands in the Powder River and Bighorn Mountains region. The nomadic, nonreservation na-



Chief Sitting Bull led Sioux warriors in a victory over General George Armstrong Custer at the Battle of Little Big Horn on June 26, 1876. *(Denver Public Library)*

tives were led by Sitting Bull and Crazy Horse. Both groups lived virtually unmolested until gold was discovered in the Black Hills, an area held sacred by the Sioux and part of the Great Sioux Nation. The flood of prospectors into the area—led by General George Armstrong Custer in violation of the 1868 treaty—necessarily caused friction with the natives. As hostilities erupted, the government stepped in and ordered all the Sioux to congregate at the reservation, thereby reducing their contact with gold hunters and freeing the gold-rich lands. The order was followed by an announcement that all Indians not on the reservation by early 1876 would be considered hostile and would be hunted down and brought in by military force.

Many Sioux had no intention of returning to the reservation; they, along with some Cheyenne allies, rallied around Sitting Bull and Crazy Horse. When the deadline passed, troops were sent to round up the natives. On June 26, 1876, General Custer led his troops in an attack on a large party at Little Big Horn and was annihilated. Custer's defeat caused a public outcry in the East and resulted in more troops being sent to subdue the Native Americans. The natives, having no supply lines, could not keep a large force in the field for any length of time and eventually had to break into smaller bands. One by one, the bands were hunted down and forced to surrender. Crazy Horse and more than 1,000 natives surrendered in the spring of 1877. Sitting Bull and his followers fled to Canada, refusing to submit, although he eventually returned and surrendered in 1881. With Sitting Bull's surrender, even the powerful Sioux tribe realized the futility of resistance and, without the buffalo, survival off the reservation was all but impossible.

Other western tribes soon capitulated as well. In 1877 the Nez Perce led the U.S. Army on a dramatic 1,700-mile chase in a largely unsuccessful effort to escape to Canada. The Bannock, Shoshone, and Paiute in the Northwest rose up briefly in 1878–1879, only to be crushed by the army and ushered back to their reservations. Likewise, the Ute in Colorado staged a brief rebellion in 1879. The last Native Americans to be subjected to the force of military campaigns were the Apache in the mountains of New Mexico and Arizona. There, a small band led by Geronimo, successfully defied the army's attempts to contain them on reservations until the Apache, too, surrendered in 1886. In order to prevent any further problems, the government shipped Geronimo and 500 Apache to Florida to be imprisoned.

Efforts at Incorporation

With the conclusion of organized resistance, and the gradual reduction of the size of reservations, the government attempted to incorporate the natives into the American system. The goal was to eventually eliminate the need for reservations completely and convert the natives into "productive" citizens. The assimilation policy revolved around two basic tenets. First, tribal unity had to be destroyed to teach the Native Americans individuality. This would be accomplished by taking them away from tribally owned reservations and giving them individual allotments of land to live upon. Second, children would be educated in specially created Indian boarding schools. They would be taught American culture away from the influence of their parents and the tribal mentality.

The passage of allotment legislation was hindered by reformers who feared that Native Americans did not sufficiently grasp the concept of private property. Reservations were community property, and few Indians understood how land could be "owned." To as-

sign them allotments, argued many reformers, would simply result in them selling these parcels of land off to the first white person who offered them money, resulting in a population of destitute, homeless natives. The problem was nuanced with the passage of the Dawes Act in 1887. According to the act, Indians would be allotted 160-acre plots, which would be held in trust by the government for twenty-five years, thus preventing them from selling it off. Once the reservation lands had been allocated to individuals, the "surplus" lands would be sold to white settlers.

The Dawes Act was an unqualified failure. It resulted in the loss of approximately 70 percent of tribal lands. The Native Americans, most of whom saw farming as degrading "women's work," refused to become the farmers that reformers expected. Instead of making them more independent, the Dawes Act actually increased their reliance on the American government for sustenance and support.

Education of the native children resulted in similar disappointment. The concept of educating the native peoples was not a new idea. Almost every Indian policy had included provisions for education, but they had all failed to yield the desired results. The latest idea was to remove the native children from the influence of their parents and tribal culture and place them in Indian boarding schools miles away from their families. In these more remote schools, it was reasoned, the children could be immersed in American culture and would be more susceptible to conversion. The first boarding school, the Carlisle Indian Industrial School, was opened in 1879; additional schools soon followed. The schools were set up in military fashion, with students wearing uniforms and held to a strict regimen, and emphasized learning English as the first step toward "civilization" (those caught speaking a tribal language were often subject to severe discipline). They also taught subjects like reading, writing, and arithmetic, but focused more on pragmatic skills that they thought would help students successfully blend into American society. Therefore, female students learned domestic skills, while male students were introduced to farming and industrial pursuits.

The success of the boarding schools is arguable, although school attendance increased fourfold between 1877 and 1890 (attendance was compulsory). The schools did have some success in destroying the Native American identity of many students, but at the same time that success caused resentment toward the white American culture that had destroyed this identity. Many of the graduates also found themselves outcasts when they returned home, seen almost as traitors by their families and friends.

Massacre at Wounded Knee

The final blow to the Native Americans came at Wounded Knee in 1890. In the 1880s, a Paiute mystic named Wovoka emerged as an "Indian messiah." Wovoka preached that the Indians should give up their warlike ways and that if they performed a ceremonial dance known as the Ghost Dance, God would reward them by returning the buffalo and allowing their people, both living and dead, to (re)inherit the earth. Wovoka's influence spread rapidly across the west as Native Americans who lived degraded lives on reservations grasped at the glimmer of hope offered by his teachings.

The Sioux sent a delegation to interview Wovoka and learn more of his teachings. The delegates returned to the Sioux reservation with a more militant version of the Ghost Dance, which spread quickly among the reservation's population. Sitting Bull became one of the religion's staunchest advocates. As the natives became more and more frenzied with their performance of the dance, Indian agents became alarmed and called upon the army to end the dance. The army decided that the most effective way to disrupt the performances would be to arrest the leaders, especially Sitting Bull. Realizing that soldiers would not be allowed to take Sitting Bull without violence, the army sent in Indian police to arrest him. Sitting Bull's followers realized the intent of the native police force and moved to protect their revered leader. In the scuffle that ensued, Sitting Bull was killed. In the hope of escaping the army, many native people, under the leadership of Big Foot, attempted to join Red Cloud on his reserve and fled the reservation. Custer's old unit, the since re-formed Seventh Cavalry, was sent to return these Native Americans to the reservation. The cavalry caught up with the natives at the small village of Wounded Knee and surrounded them on December 28, 1890. The next morning, as the army was disarming the natives, one of their guns discharged and the army opened fire. When the smoke cleared, over 200 Sioux men, women, and children lay dead. Apparently in retaliation for Custer's defeat, and in a repeat of the shameful acts at Sand Creek, the bodies were again horribly mutilated.

The Wounded Knee Massacre brought a final and decisive end to armed native conflict. There would be no more uprisings, but the issue of how to handle the Native American population still remained. Attempts to concentrate the native peoples on reservations had

failed when both natives and whites violated the boundaries set up in treaties. Attempts to Americanize the natives through individual plots of land and educating them to the American way also ended in failure. Wounded Knee only re-emphasized the need for a new policy to deal with Native Americans and showed clearly the failure of previous policies to have the desired effect. A new wave of legislation would be introduced at the turn of the century, and several new policies would be attempted to bring the American Indian into the American melting pot, but most would have no more success than those of the previous 100 years.

Identity and Literature

The use of literature to explore identity issues is not unique to the indigenous culture of North America. Some of America's most renowned works, for example, J.D. Salinger's *Catcher in the Rye* (1951), deal with the subject superbly. Yet, long before Salinger, native people used literature to explore identity issues and to present themselves and their culture to the broader, dominant society. Early works by native authors were often autobiographical religious tracts like those of George Copway and Peter Jones, missionaries who used their English-language skills and indigenous identity to spread Christianity among native people. Others, like Simon Pokagon and Andrew Blackbird, used their literary skills to tell the stories of their lives and their tribes, often with the intent to bring to light the many problems faced by native people struggling against the encroachments of "civilization."

These early authors (and many, many others) faced the issue of indigenous identity directly by working in the genre of autobiography. Others, like D'Arcy McNickle in *The Surrounded* (1936), turned away from autobiography to tell the story of native people struggling to maintain their identity through a more fictional and tribal approach. Often, these early fictional accounts of native people on the cusp between traditional life and "civilization" met with wide success and brought a large measure of respectability to the emerging field of Native American literature.

The rise of the civil rights movement in this country, coupled with the emergence of "Red Power," led many authors to write stories that confronted the issue of Native American identity as less of a tribal issue—like *The Surrounded,* for instance—and created unique characters whose identity crisis could be confronted head-on through personal and probing literature. One of the most stunning of these works is *Winter in the Blood* (1974), by the Blackfeet/Gros Ventre author James Welch. In this dark novel, the main character is not even given a name; instead, he is a young man very troubled about his identity who spends much of the book searching for his roots and his place in modern society (when he's not drinking or off on some seemingly self-destructive adventure). Of course, by the end of the book, Welch has the protagonist finding his home—both physically and spiritually—back on the reservation of his birth.

Another dark and troubling story of the search for identity can be found in Oscar Zeta Acosta's *The Autobiography of a Brown Buffalo* (1972). Although Acosta returns to the autobiographical style utilized by earlier indigenous authors, his is not a story of "my life as an Indian." Instead, Acosta painfully explores American discrimination and alienation by delving deep into his Chicano roots, eventually finding himself broke and broken in Mexico, where he finally escapes from his tormented life to discover his place in North America as an indigenous person (hence the *Buffalo* reference in the title). In the end, he returns to his native California and embarks on a public life of activism for Chicano/Native American causes. Oscar Acosta, ironically true to the tumultuous, troubled life he led, disappeared around 1974 and is presumed dead.

Many other writers have focused on the cultural confusion that confronts many people of mixed blood and is manifested in identity crises typified by that of Oscar Zeta Acosta. In the Ojibway author Louise Erdrich's widely acclaimed novel, *Tracks* (1989), the character Pauline is tortured by her mixed-blood status; she is not truly comfortable or accepted in either the white or the native world. For the teenage Pauline, the ambiguity is too much to bear, and she rejects her identity as an American Indian, converts to Christianity, and eventually claims that Christ has declared her to be "pure white," like her grandfather. Contrasted to Pauline in the novel is an elder of Pauline's tribe, Nanapush, who is anything but confused about his heritage. Instead of doubt and rejection, Nanapush sees his mission in life as the teacher and exemplar of

native identity not only for his fellow tribal members, but for those in the surrounding (and encroaching) white community. For Louise Erdrich (herself a mixed-blood), the novel *Tracks* is a masterful and imaginative exploration of what it means to be Native American in a world that demeans such traditional ways as superstition and seeks to impose a modernity upon a people who are—up to that point of culture conflict—comfortable knowing who they are.

Another brilliant exploration of native identity in modern fiction can be found in Laguna Pueblo author Leslie Marmon Silko's *Ceremony* (1977). Here the main character, Tayo, is another very confused and troubled mixed-blood who is rejected by both cultures. After failing to protect his full-blood cousin in World War II, and abandoning his uncle (who dies while he is gone) to go off and fight in the "whiteman's war," Tayo returns to his Southwestern reservation, which is in the midst of a drought. Suffering from post-traumatic stress syndrome and his personal guilt over the effects of the drought (he cursed the rain while in the South Pacific during the war), Tayo embarks upon a ceremonial process to restore his mental health, end the drought, and find his uncle's lost, half-breed cattle. Along this ceremonial path, he comes to accept that his "cure" lies in a warm embrace of his indigenous culture, always just outside of his reach owing to the fact that his rejection by the community was always a corollary to the pride and hope that was lavished on his full-blood cousin with whom he was raised as a brother. In the end, Tayo finds the mixed-blood cattle—who were returning to their southern, Mexican "roots"—and by doing so, completes the healing ceremony as it was laid out by a mixed-blood "medicine man." Aside from the obvious comparison between the lost cattle and Tayo's struggle for identity, Silko also uses the identity of Tayo's cousin/brother, Rocky, to explore the difficulties inherent in rejecting one's cultural heritage. Here she has Rocky as a full-blood who is hell-bent on rejecting his Native American heritage and making a "success" of himself in the dominant, non-native society. Yet he is senselessly killed fighting in "their" war, while his half-blood cousin/brother—in tune with his indigenous roots—survives. Profound ironies abound.

A distinctly different portrayal of a native protagonist is found in Pueblo/Yaqui writer Martin Cruz Smith's *Stallion Gate* (1986). In this novel of the building of the atomic bomb, Smith creates a "Super Indian" character named Joe Peña. Joe Peña, the driver for General Groves of the Manhattan Project, is as far from the unnamed James Welch character or Silko's Tayo as you can get—an accomplished jazz pianist, a combative and anti-authority GI, a champion boxer, a confidant (and adviser) to those building the atomic bomb, a spy-chaser, a womanizer, an important Indian dancer, an expert marksman, and general all-around Super Everyman. In this novel, Smith uses the accomplishments of Joe Peña to undermine and dispel the stereotypes of the lost, identity-less, and searching character so common in many of the books that explore Native American identity.

A great number of other important indigenous writers explore the theme of identity in their works—such as Charles Eastman (*Indian Boyhood*, 1902), Mourning Dove (Hum-ishu-ma) (*Cogewea, the Half-blood: A Depiction of the Great Montana Cattle Range,* 1981), Sarah Winnemucca (*Life Among the Piutes: Their Wrongs and Claims,* 1883), and the Pulitzer Prize–winning N. Scott Momaday, who won the prize for his novel *House Made of Dawn* (1968) in 1969. Native writers also produce and publish a tremendous amount of poetry based on the theme of identity—poets like E. Pauline Johnson, Joy Harjo, Paula Gunn Allen, Duane Niatum, and Gerald Vizenor have all used their poetic skills to explore what it means to be indigenous in a predominantly non-native world. It should also be noted that the world of "identity politics" is not restricted to the writings of novelists and poets. Contemporary North American playwrights like Drew Taylor, screenplay writers like Sherman Alexie, film directors like Chris Eyre, comedians like Charlie Hill, songwriters and musicians like Robbie Roberson, and rap-artists like Lightfoot all bring identity issues to their work and all serve the broader movement toward cultural survival and self-determination that is at the heart of what it means to be a Native American in today's world.

Rural, Social, and Political Movements

Introduction

For most of its history, America has been mostly a rural society. Indeed, from the early seventeenth century to the early twentieth century, the majority of Americans lived and worked in the countryside. Many of the nation's most significant rural social movements developed in these years. The essays in this section tell the stories of fifteen such social movements from the late colonial era to the late twentieth century and from the completely local to those nationwide in scope. The following writings, though not a definitive accounting of America's rural social movements, include the most important ones. All bear on fundamental themes of political and economic power, class and race, and, at least in one case, gender roles in the countryside.

Readers may note a common thread in the essays explaining rural political and economic protest movements. With only a handful of notable exceptions, America's rural common people usually lost their battles. Their experience, then, is at odds with the dominant American national myth of triumph through virtue. Their setbacks made them in a sense—as historian C. Vann Woodward observed of Southerners in particular—"un-American." Rural Americans shared something important in common with the rest of the world: firsthand knowledge of defeat. Yet, these movements are not essentially about defeat but about struggle. Rural people, like others elsewhere, struggled throughout their history for the sometimes contradictory goals of autonomy, security, and comfort.

These struggles began early in the American experience. In the late colonial era, a series of rural protests in western Massachusetts and in the Appalachian and Southern backcountry united country people in "Regulator" uprisings, Shays' Rebellion, and the Whiskey Rebellion. In each case, these social movements resorted to violence to achieve their goals in much the same manner as those in the East which had just resulted in the winning of independence from the British Empire. Yet, contesting elites defeated these resistance movements in part because of their reliance on violence. Violence as well as other forms of political struggle accompanied the New York State Anti-Rent movement of the 1820s and 1830s, which fought the hereditary land barons of the Hudson River Valley whose claims to tenant farmers' land dated from the seventeenth century. From the same era, various antebellum American communities explored perfectionist social models from the 1820s through the 1850s. Far from using violence, most of these utopian movements sought ordered perfectionism through experimental cooperative social structures.

The decades following the Civil War saw a dramatic increase in rural social movements. Freedmen from the South fled from oppression to opportunity in the 1870s, and a host of protest movements flowered among disgruntled small farmers in the Midwest, South, and Great Plains. In the 1860s, a century of cooperation, protest, and education began with the formation of the Patrons of Husbandry, known as the Grange. While the cataclysm of Civil War permanently dampened utopian dreams, its outcome created some uncertain opportunities for formerly enslaved African Americans. Hopeful "Exodusters" fled white supremacy in the South to Great Plains settlements during the 1870s and 1880s with varying outcomes. Another social movement took political form in the 1870s and 1880s with the Greenbacker Party seeking to forge links between rural and urban labor militancy. In the 1870s, rural Texans founded an organization that became the Farmers' Alliance whose branches would reach throughout the South, the West, and Midwest during the 1880s. On its deathbed, the Farmers' Alliance combined with the Knights of Labor to create the most significant rural protest movement in American history with the formation of the People's Party (Populists). The Populists of the 1890s represent the highwater mark of rural social movements in the United States in total numbers for good

reason. The conditions against which they protested would inexorably empty out the people of the countryside into the working class of the great twentieth-century American cities. Yet, in spite of diminishing numbers, the most discontented of those remaining on the land would seek to voice their point of view in a number of militant twentieth-century rural social movements.

The twentieth century saw the virtual elimination of the rural "plain folk" as an economic class, with the most painful adjustments occurring in the first forty years of the century. These economic changes provoked a variety of responses among rural people, but most endured the transformation in social silence. Some, perhaps, even rejoiced at its demise. A vocal minority, however, expressed disagreement with the trends of the nationwide marketplace. Discontented farmers produced a brief, but radical, critique of the new economic order in the agrarian Socialist movement of the Southwest. While World War I-era repression killed off the Socialist movement, remnants survived and briefly flourished on the northern plains and upper Midwest in the rural Nonpartisan League of the Dakotas and Minnesota. The coming of the Great Depression created misery in the American South, where profoundly impoverished black and white sharecroppers fought their landlords, the Depression, and unintended consequences of the New Deal through the Southern Tenant Farmers' Union. And in the midst of such generally hard times for rural people, American farmwomen struggled to provide for their families with the aid of the U.S. Department of Agriculture's Home Demonstration movement.

World War II diverted even more rural people into the new jobs of the cities, especially in the South, but rural social movements continued among the remaining rural population. In some cases, such movements grew from early twentieth-century roots but persisted into the late twentieth and early twenty-first centuries. A uniquely Minnesotan rural social movement arose in the Farmer-Labor Party. Unlike many other rural movements, this expression of rural-urban working-class solidarity experienced significant long-term success, eventually becoming the majority political party throughout much of the twentieth century. Perhaps the longest-lived rural social movement in U.S. history is that of West Coast farm workers whose movement stretches from the late nineteenth century into the twenty-first century, from the first struggles for improved treatment to the gains and losses of the United Farm Workers. By the late twentieth century, rural Americans were few in number. Yet, enough remained—and remained discontented—to produce the late-twentieth-century phenomenon of rural protest by otherwise conservative farm owners known as the American Agricultural Movement from 1979 to the present.

The essays in this section suggest the complexity and richness of America's rural past—where disparate movements have struggled to define, control, reshape, or maintain various groups' places in that countryside since the late colonial era.

Kyle Wilkison

Regulator Movements and Other Rebellions 1760s–1790s

Agrarian protest movements were a regular feature of late colonial and early republican politics, taking place in every colony or state during the last half of the eighteenth century. These protests were driven by complex and sometimes overlapping issues, such as disputed land titles, burdensome debt and taxation, and ineffective or corrupt government. They had a class dimension, often pitting poor and middling family farmers against wealthy merchants and land speculators. They also had a sectional or geographic element, with residents of the backcountry (the rural, developing, recently settled region in the western parts of the colonies/states) challenging a coastal establishment that monopolized political and economic power. Although protesters typically used legal channels to state their grievances, they did not hesitate to resort to violence, including broadly organized armed insurrection, to achieve their ends. Yet the "radicalism" of these agrarian movements is ambiguous. In one sense they were cut from the same fabric as the American Revolution, appropriating its language and seeking to extend its benefits more broadly. In another sense, they hearken back to the traditional crowd rituals of early modern Europe, seeking to change local conditions but not challenging the social and political system more broadly.

North Carolina Regulators

Among the earliest agrarian protest movements was the North Carolina Regulation, which had its origins in part in the land wars of the mid-1760s. During the preceding decades, Henry McCulloh, an English merchant and Crown favorite, had amassed some 1.2 million acres of land in North Carolina, much of it in the piedmont or backcountry. By the time McCulloh sorted out his surveys after the Seven Years' War, hundreds of small farmers had migrated into the piedmont and established themselves on his claims, some with legal title, others with surveys only, and still others claiming squatters' rights. McCulloh pressed his claims all the same, sparking violent opposition from farmers who resented the efforts of an absentee speculator to control land they had improved. Angry farmers in Anson County seized and beat McCulloh's agents, but in the end his claims prevailed, forcing farmers to purchase lands they still believed they owned. Resentment from these land wars would fuel the much broader and more explosive Regulator movement later in the decade.

This second phase of the movement was driven by class antagonism, ineffective government, and political corruption. By the late 1760s, backcountry farmers were complaining to Governor William Tryon about a whole host of abuses: local officials were corrupt, they claimed, charging extortionate fees for services, seizing farms and jailing farmers for delinquent taxes and debt, and monopolizing local political control through multiple officeholding. Taxation was also an issue: provincial taxes were especially burdensome for people who lived in a cash-poor region, whose economy was based primarily on barter, who saw little in the way of government services, and who were underrepresented in the colonial assembly. Led primarily by Herman Husband, a prosperous yeoman farmer and passionate evangelical who fused country politics with millennarian thinking, backcountry farmers organized as the Regulators. At its height, the Regulation numbered around 6,000 members, approximately three-fourths of the backcountry's adult white male population. Between 1766 and 1771, Regulators repeatedly petitioned provincial leaders, openly refused to pay taxes, destroyed property, disrupted government, and even took up arms against the colonial militia. In September 1770, an angry mob assaulted local officials and judges at the Orange County courthouse in Hillsborough, destroyed the home of one particularly detested official, and staged a mock court. In the wake of the Hillsborough riot, Husband was

arrested, acquitted, and released, but Tryon, determined to put an end to the insurgency, marched into the backcountry with 1,200 provincial militia and arrest warrants for key Regulation leaders. On May 16, 1771, Tryon's forces engaged a poorly armed and undisciplined Regulator army at Alamance Creek. Within three hours his forces had routed the Regulators; thirty were killed, 200 wounded, twelve were tried, and seven were later executed. The remaining Regulators were pardoned. Herman Husband escaped to Pennsylvania, where he would later play a minor role in the Whiskey Rebellion. Tryon's heavy-handed approach ended the insurgency but did not address its causes; unresolved Regulator grievances would surface again in the coming years, fueling Revolutionary sentiment in the North Carolina backcountry.

South Carolina Regulators

Whereas local political corruption drove agrarian protest in North Carolina, the absence of local political control fueled conflict in the South Carolina backcountry. This conflict had its origins in South Carolina's unique demographic makeup. After 1710, coastal rice planters comprised a shrinking white minority surrounded by hostile slaves at home and potentially hostile Indians in the interior. Seeking to create a human buffer zone on the frontier and increase the colony's white population, after 1730 provincial authorities in Charleston sponsored a settlement scheme that brought thousands of white farmers into central and upper South Carolina. By the mid-1760s, the majority of South Carolina's white population was concentrated in the interior, but both political power and the center of provincial government remained in Charleston, some 200 miles from some of the most densely populated backcountry communities. In the absence of local courts, upcountry settlers could not convey property, prosecute debts, or resolve boundary disputes without traveling to Charleston. Law enforcement was weak; warrants were issued from Charleston, and suspected criminals were transferred to lowcountry precincts to await trial.

This institutional vacuum became acute in the wake of the Seven Years' War, when a crisis of law and order erupted in the upcountry. Settlers reported that gangs of bandits were roaming the countryside, stealing livestock, kidnapping women, harboring slaves, and beating, torturing, and robbing settlers. Among these outlaws were veterans of the recent Cherokee War, farmers who had been bankrupted by drought and crop failure, and career criminals capitalizing on the region's weak law enforcement. In addition to these outlaws, backcountry settlers complained of hunters who subsisted through foraging and killing game and whose way of life went against the emerging social order centered on family farms; the settlers demanded vagrancy laws to control the hunting population. When the General Assembly was slow to act on these grievances, upcountry farmers took matters into their own hands. In 1767, they organized as the Regulators. Led by storekeepers, militia captains, and prosperous planters like Moses Kirkland and Patrick Calhoun, the Regulators whipped, banished, and arrested suspected bandits and forced hunters to work on farms. For the most part, provincial authorities in the lowcountry were sympathetic with Regulator goals and methods. However, in July 1768, a lowcountry militia unit clashed with Regulators at Marrs Bluff when a constable tried to arrest Regulator leader Gideon Gibson. In the pitched battle that ensued, Regulators wounded a number of lowcountry militiamen and whipped several others. Although such conflict raised tensions between coastal and upcountry authorities, it also prodded the General Assembly to move swiftly. That year the Assembly extended political representation into the upcountry, and in 1769 it passed the Circuit Court Act, which established district courts and sheriffs in the interior. Thus, whereas the North Carolina Regulator affair only deepened sectional tensions, in South Carolina the grievances of backcountry settlers were amicably resolved and served to build solidarity between the regions.

Shays' Rebellion—Massachusetts Regulators

A different kind of agrarian uprising took place in Massachusetts in the wake of the Revolutionary War. As in the Carolinas, rural Massachusetts was populated by independent family farmers. These yeomen relied largely on family labor to work their small freehold farms, exchanged their meager surpluses with neighbors and storekeepers for goods and services, and participated in a rich communal life based on interdependency and neighborliness. By contrast, in the urban trading centers along the coast, wealthy merchants dominated a commercial money economy centered on profits and long-distance trade. An elaborate credit network extended from these coastal merchants to inland storekeepers and increasingly to small farmers.

Two developments occurred after the war to pro-

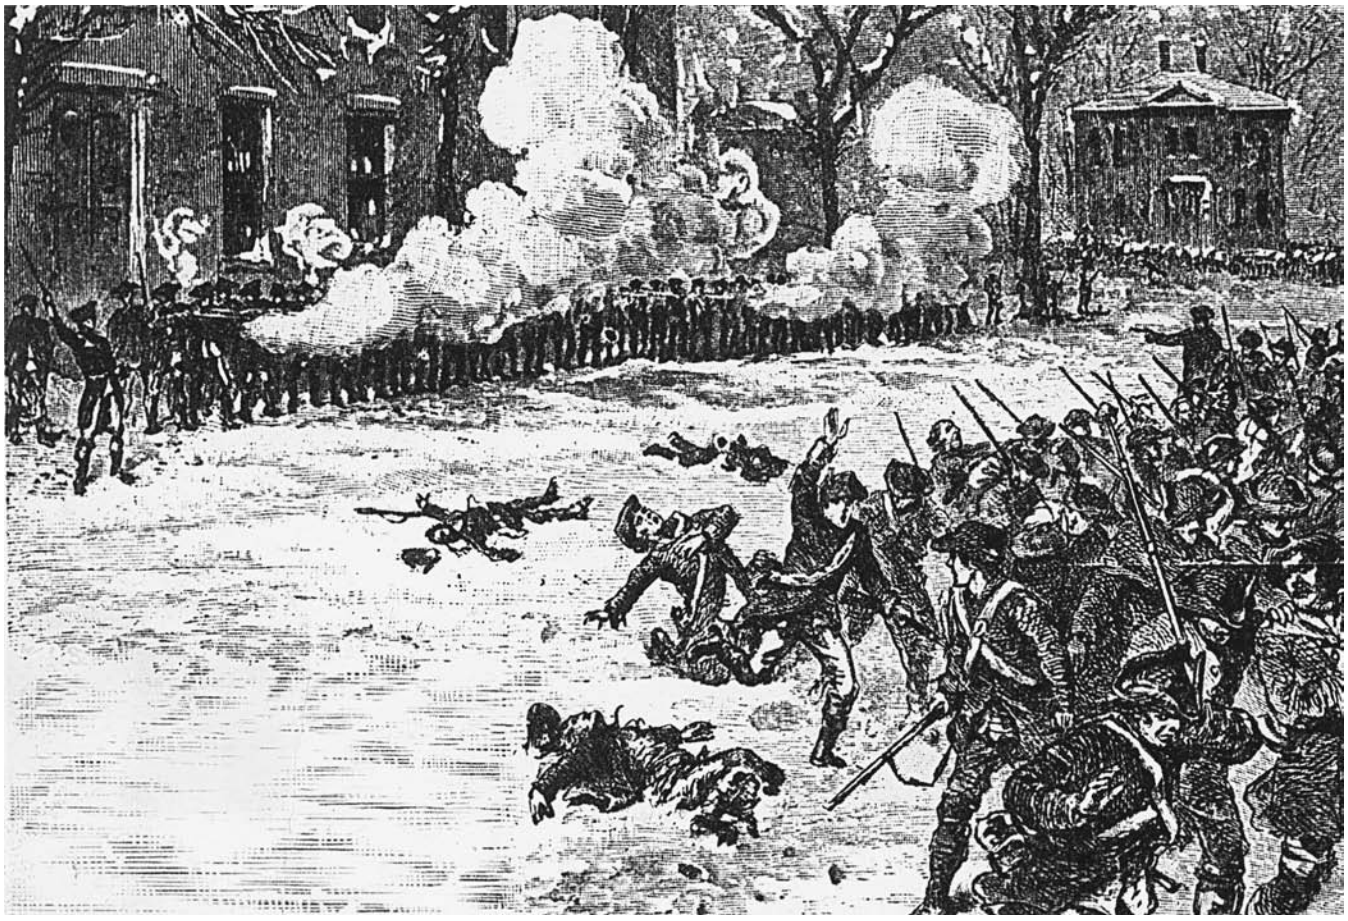
duce an economic crisis and fuel sectional conflict in Massachusetts. First, American merchants reestablished trade with the British. Encumbered with massive inventories, British merchants were only too willing to accommodate American demands for English goods, offering easy credit and reasonable prices. At the same time, however, the British shut American merchants out of the West Indian trade, leaving them with few markets for their exports and little cash to pay for British goods. The resulting trade deficit siphoned off the supply of hard money in the United States, creating an economic depression. When British merchants called in their loans, a debt crisis ensued. Coastal merchants sued country storekeepers, who in turn sued and jailed farmers for debts. (The idea was to force friends and family to pay these debts in order to free the head of household from jail.) Second, the state's need to retire the huge war debt led to increased property taxes. These taxes were especially burdensome to inland farmers, who were accustomed to paying in goods and services and had little hard money, especially as the postwar depression deepened. Thus, while creditors were jailing farmers for unpaid debts, state officials were seizing and selling their farms to recover delinquent taxes.

Inland farmers initially responded to this crisis by organizing county conventions and petitioning for relief and reform through legal channels. Between 1784 and 1787, they pleaded with the state to print paper currency, enact tender laws that permitted in-kind payment of debts, and replace the Court of Common Pleas with elected committees of arbitration to mediate tax and debt delinquency suits. They also called for more equitable taxation through reductions in property taxes and increases in poll taxes. However, the state sided with the mercantile interests and rejected these petitions. Wild rumors circulated about the insurgent farmers—that they were backed by the British, that they were levelers seeking to engender equality, that they were bent on destroying commerce—leaving little room for conciliation between the two parties. In late 1786, farmers organized as the Regulators, forcefully closing several inland courts and freeing jailed debtors. In January 1787, the movement turned more violent when some 1,200 men, led by Daniel Shays, a captain in the Revolution, advanced on the federal arsenal at Springfield. The governor mustered a force of 4,400 coastal militia to meet the "Shaysites" and routed them with little difficulty. Thereafter, the Shays' rebels resorted to guerrilla tactics, leading raids on merchants, lawyers, and storekeepers through the summer of 1787. Violence ceased soon thereafter, when an economic upswing put an end to the depression and brought peace to the countryside. Moreover, the new state legislature proved more sympathetic to Regulator demands, lowering government fees, passing tender laws, and providing tax relief. Similar debt insurgencies took place throughout New England as well as in Maryland, Virginia, South Carolina, and Pennsylvania. This agrarian unrest fueled support for the new federal constitution, with its powerful chief executive and its standing federal army.

The Whiskey Rebellion

The new federal government would soon get its first opportunity to test its strength against agrarian protesters in western Pennsylvania. This movement, too, was rooted in the postwar economic crisis. As part of his vision for a strong national economy, Alexander Hamilton, secretary of the Treasury under George Washington, proposed to secure the nation's credit by retiring the national debt and assuming the remaining war debts of the states. Hamilton's plan had several controversial elements. First, it benefited New England states disproportionately because, unlike most Southern and Mid-Atlantic states, they were still mired in debt. (Hamilton won Southern support for his plan by agreeing to relocate the national capital to Virginia.) Second, it benefited wealthy speculators who had purchased bonds from poor, cash-starved veterans at a fraction of their value but who now stood to receive the full face value of these bonds from the federal government. (Hamilton made no apologies for seeking to win the support and trust of the wealthy.) Third, Hamilton proposed to raise the revenue for retiring the debt from a new excise tax on distilled spirits. This whiskey tax gave a break to large producers—the more they produced, the lower the tax per gallon—and hurt small, home-based distillers the most. Despite these controversial measures, Congress enacted Hamilton's credit program in 1791.

The whiskey tax was especially hard on small backcountry farmers who depended on whiskey sales for their livelihood. Corn was too bulky and cheap to ship profitably to coastal markets, but corn liquor could be traded to distant markets for profits or among neighbors as a key commodity in the local barter economy. In the eyes of poor Western distillers and farmers, the excise tax took a big bite out of their already meager incomes; it was imposed by a federal government that did not represent the interests of common people and from which much of the Western



The Massachusetts militia rebuffs an attack by Daniel Shays and his agrarian rebels at the federal arsenal in Springfield in January 1787. Although Shays' Rebellion failed militarily, it induced the state legislature to enact laws providing relief to farmers and galvanized support for a new federal constitution. *(Brown Brothers)*

region was already alienated; and the revenues it produced went to service the debts of other states or line the pockets of rich bond speculators. To further fuel class tensions, large landowners and absentee land speculators frequently served as excise tax collectors. From Georgia to Pennsylvania, agrarian protesters resisted the excise tax through petitions, nonpayment, and violence. Resistance culminated in western Pennsylvania in 1794, when protesters tarred and feathered tax collectors, closed county courts, burned the home of one exciseman, and marched on Pittsburgh, vowing to destroy the town and kill its leading citizens. In September, President George Washington declared western Pennsylvania in rebellion and ordered 12,950 militiamen—a larger force than he had commanded during the Revolution—to occupy the region, put down the rebellion, and arrest the leading insurgents. Although clearly an exaggerated response to an exaggerated problem, Washington's show of force was effective: the protesters dispersed, twenty were arrested, and two were convicted of treason and later pardoned by the president. For the agrarian rebels, the lesson of the Whiskey Rebellion was all too clear: the federal government had proved itself fully capable of dealing with local resistance. On the other hand, Hamilton's whiskey tax was never adequately enforced, even after the rebellion was put down, and the insurgents had shown that the tradition of agrarian protest and the Revolution's spirit of political dissent was still alive and well.

Liberty Men

Many agrarian protest movements turned on issues of land ownership that pitted small freeholders against wealthy, often-absentee speculators or proprietors. Such was the case in post-Revolutionary Maine,

Pennsylvania farmers opposed to the whiskey tax carry a tax collector they have tarred and feathered. Although Americans had long protested higher taxes and economic injustices, the Whiskey Rebellion of 1794 proved the first major insurrection under the new U.S. government. President George Washington sent nearly 13,000 troops to suppress the uprising. *(Brown Brothers)*

where thousands of poor farmers clashed with distant but powerful proprietors (landlords) in the 1790s and early 1800s. A series of proprietary grants for large tracts in Maine had been issued under Charles I in 1632, and they were extremely problematic: there were no precise surveys, claims overlapped, and the proprietors' tendency to contest titles deterred potential buyers and settlers. This changed during the Revolutionary War. Under the assumption that Massachusetts would confiscate the proprietary lands (most proprietors were also Loyalists) and redistribute them to common people, tens of thousands of settlers poured into Maine from southern New England and established themselves on the proprietors' claims. These immigrants were among the poorest of New England's poor; their lives turned upside down by the war, they were desperate for land. Massachusetts did not confiscate these lands, however, and after the war the proprietors regrouped. Recruiting powerful allies like Henry Knox and Josiah Little, both of whom were American military leaders with extensive political connections, the proprietors redrew their boundaries precisely and reasserted their claims to the Maine lands, aiming to lease, sell, or eject the "squatters" from their lands. The region's growing population and its improved farmsteads now promised lucrative returns for the absentee proprietors, who wielded nearly absolute political power in the assembly as well as in the courts.

Much of the subsequent contest between proprietors and farmers turned on the meaning of land ownership. The proprietors' claims rested on legal title that was conferred by a sovereign, regardless of actual physical possession. For their part, farmers argued that legitimate ownership was conferred through their use of the land: it was rightfully theirs because they took only what they needed to support their households and more importantly because they possessed and improved it with their labor. Moreover, they viewed land ownership as essential to a democratic society; only as freeholders could they maintain their autonomy and avoid the slavish dependency of tenancy. Speculators and absentee landlords were in their view parasites profiting from the labor of the common people. Settlers petitioned the state, but they could not match the costly, high-pressure legal tactics used by the proprietors. Instead, they quickly turned to extralegal solutions aimed at intimidating local supporters of the proprietors and terrorizing the proprietors' agents. Disguised as Indians, agrarian insurgents beat and mutilated surveyors, destroyed property of the proprietors' local allies, and vowed to kill anyone who tried to evict farmers or who harbored proprietary agents. Dubbed White Indians by their enemies, agrarian protesters were seen as half-savage, the enemies of civilization and social order. Deeming themselves Liberty Men, militant farmers claimed

the heritage of the Revolution and its promise of liberty and local autonomy. The ongoing struggle between proprietors and Liberty Men was not resolved until the Jeffersonian Republicans defeated the Federalists in 1800–1801 and achieved a compromise on the question of land ownership: labor would not confer title, but neither could landlords extort the improvements of settlers. The proprietors were forced to offer a just price. Nonetheless, agrarian conflict would continue in parts of Maine for more than a decade after the Jeffersonian revolution.

The Context of Agrarian Conflict

Geography interwove with class and cultural differences to create a complex context for agrarian conflict in the late colonial and early national periods. The backcountry was by definition a developing region. Western communities often lacked access to navigable rivers and were forced to ship their goods over poor roads, limiting their access to commercial markets. Farmers were preoccupied with clearing land and providing for the basic survival needs of their families; they exchanged their surpluses locally, but commercial markets took time to develop. Most immigrants were poor, many were desperate, and nearly all were poorly educated. Few owned slaves or servants, depending on family labor and, during peak periods, on the shared labor of neighbors. Not until the second or third generations would these backcountry households achieve a comfortable subsistence or "competence." Even the wealthiest and most ambitious planters and merchants were modest by Eastern standards. Socially and economically, Westerners stood in stark contrast to the established communities to the East, with their rich commercial markets and extremes of wealth and poverty. Furthermore, backcountry communities were far from the centers of power; they were politically alienated, with little or no voice in the decisions that affected their lives. The peculiar economic, social, and political geography of eighteenth-century America provides the context through which agrarian conflict must be understood.

But there was also an important cultural gap between East and West. Religious differences played a role in agrarian conflict. Most North Carolina Regulators belonged to dissenting churches and resented paying taxes to support a distant and, to them, anti-Christian Anglican establishment. In Maine, the insurgent evangelicalism of the Liberty Men glorified the poor and produced charismatic leaders who fused religion and politics, making the land war into a holy war. Cultural differences also surfaced around economic issues. Backcountry communities used a borrowing system based on personal, face-to-face exchanges of goods and labor, not the impersonal money economy based on cash transactions that prevailed along the seaboard. Although grounded in strong notions of private property and economic autonomy, these communities survived because of neighborliness and interdependence. In South Carolina, the absence of local courts made for a low level of litigiousness in the upcountry and forced residents to turn to informal ways of resolving disputes, through their churches or among neighbors. In fact, agrarian protesters frequently targeted the courts, viewing them as the tools of wealthy creditors, distant speculators, and powerful taxmen, not as dispensers of justice. In Maine, Liberty Men fashioned a theory of use-value to justify their property claims, while the proprietors relied on notions of legal right and saw land purely as a commodity or source of profit, not as the source of livelihood and autonomy. These cultural differences deepened the conflict between East and West by making it about basic values, assumptions, and social relationships, not simply about resources.

How Radical Were Agrarian Protesters?

Eighteenth-century agrarian protest movements were not radical in the sense that insurgents hoped to overturn or transform an unjust system. Instead, agrarian rebels typically sought to redress specific local grievances. They regarded the political and social system itself to be sound, but believed it had been betrayed by specific monied interests intent on enriching themselves at the expense of the common good. This was as true under the colonial "patronage" system, where the ruling class was expected to serve the interests of the whole and protect the common people from abuse, as it was under the new "republican" system, where virtuous and enlightened citizen-leaders protected democracy from any who sought to exploit or betray it. When such men failed to protect the interests of the whole, it fell to the people (the "mob," as they were known to the elite) to set things aright. In the absence of interest group or party politics—political parties were viewed as a threat to national unity before 1800—the only workable alternative for oppressed farmers was violence. They thus stood within a long tradition that regarded violence as a necessary and legitimate part of the political process (a senti-

ment echoed by Jefferson himself). After the Jeffersonian triumph of 1800–1801, it became increasingly clear that partisanship and interest-group politics would not destroy the republic. As agrarian protesters were absorbed into the Jeffersonian Republican fold, they abandoned violence as a political weapon. Consequently, agrarian protest movements declined with the emergence of party politics.

Anti-Rent Movement 1830s–1860s

The Anti-Rent movement convulsed several counties in upstate New York in the period between 1839 and 1865, as tenants living on the estates of wealthy landlords, called "patroons," revolted against leases that were essentially feudal tenures. Through a combination of political activity, rent strikes, and violent action, the Anti-Renters built a movement that at its height threatened not only public order but also the status of land as a commodity to be traded in freely. Divisions in the Anti-Rent movement between those who thought of land as a natural right and those who simply sought to question particular land titles condemned the movement to instability, however, and this, combined with government opposition, led to the decline of the movement in the early 1850s.

Like the populist movement of the late nineteenth century, the Anti-Rent movement was primarily one of small farmers facing untenable economic change. The hill-country tenant farmers of Albany, Delaware, Rensselaer, and surrounding New York counties were united by a common ideology and experience. The tenant farmers were linked to the wealthy families whose manor houses dotted the valleys of upstate New York through a peculiar device called the "lease-in-fee." Through these contracts, most of which had been signed before the Revolutionary War, the land of the farms was conveyed as if outright, but the tenants were contractually obligated to pay a perpetual rent in the form of crops to the landlords. They also owed something approaching feudal service, in the form of an agreement to provide "four fat fowls" per year, along with one day's horse-and-cart hire and personal work for the patroon. Nor were they allowed to sell the farms they occupied, unless they remitted to the patroon families one-quarter of the purchase price. If the occupier of the land violated any of these stipulations, the patroon had the right to reoccupy the land.

The "lease-in-fee" was a legal structure that existed nowhere else in America, and did not even exist in monarchical Britain, where such feudal services had been abolished in the 1200s. Nonetheless, because ancestors of tenants or occupiers of the land had once freely contracted with the patroons, there seemed to be no legal way for the tenants to free themselves from the disagreeable and undemocratic elements of their contracts. The United States Constitution specifically prohibited even legislatures from interfering with the freedom of free individuals to create contracts.

Despite the disagreeable nature of the leasehold system, the tenants had created what historian Reeve Huston has called "independent, productive, patriarchal households . . . marked by rough economic equality, household autonomy, and widespread access to natural resources." They insisted on their version of property rights, having rebelled in the 1750s in support of the Lockean idea that he who actually lived on and cultivated the land should own it. They cooperated with their neighbors through exchanges of labor and produced much of what they needed through the labor of the female members of their families. Like English peasants, they exploited the local woods for fuel and building materials, and allowed their livestock to graze on the common lands of the patroon's estate. Access to the commons meant that poverty was either a life stage or perhaps due to bad luck, but it was not endemic. The rough equality of the hill-country households cohered well with Americans' ideas about economically independent citizens.

Precipitating Factors in Anti-Rentism

The relative contentment of the hill farmers changed with the death of Stephen Van Rensselaer III, one of the area's largest landlords. For several generations, the Van Rensselaer family, recognizing that during

THE ANTI-RENT MOVEMENT

Anti-Rent activism in upstate New York lasted from 1839 to 1865. Tenants living on the estates of landlords were granted property rights analogous to feudal estates. Tenants living on the land revolted, organizing rent strikes and mass action against their landlords, even calling for the end of land as a commodity to be traded freely. The following is an excerpt from "The 'Anti-Rent' Movement and Outbreak in New York," chronicling resistance by tenants against landlords.

Last winter the sheriff was resisted in Cattaraugus by an armed force, when attempting to execute a writ of possession. The writ was against a man who had taken a contract for his farm of 150 acres in 1821, nearly a quarter of a century before, when he had paid one dollar. He paid neither interest nor principal till 1837, when he was induced to take a new contract, and pay *fifty dollars*; and after that he utterly refused to pay any more. He had a most valuable farm, for which he was required to pay, principal and interest, at a rate rather below than above the value of new land. And this was regarded in that quarter, quite extensively, as a case calling for sympathy, if not for violence. The truth is, not that particular form of indebtedness for land which is called rent—it is indebtedness *for land* in any and every form—which makes the trouble. The agrarian spirit of the times is alive with a special hostility to this indebtedness. The claim is for land to every man without paying for it. Property in land, beyond what a man can personally occupy and cultivate, is especially denounced; and so is property, or debts, due for land. It is denounced as monopoly, it is branded as "feudal," and inconsistent, therefore with "the spirit of our institutions!"

We think it not unimportant to put to silence so far as truth can do it, the customary clamor in which many persons indulge about feudal tenures in the "Manor" of Rensselearwyck. Many, we doubt not, are deceived; but some, who use this "argument" most freely, must know better, or they ought to know better.

hard times it was impossible for tenant farmers to pay high rents, had been accepting whatever the tenants could pay and carrying the rest as arrears. This strategy could no longer be followed by the next generation, since Stephen Van Rensselaer IV also had creditors eager to collect mortgage payments. Social and economic changes taking place in the hill towns accelerated the accumulation of rent arrears. The transportation revolution that opened up canals and roads in the 1820s and 1830s enabled the easy transportation of grain from far Western lands to Eastern markets, putting New York tenant farmers with their exhausted soils at a competitive disadvantage. Tenants who did own land were passing regulations that barred the landless from access to the commons. This also made it difficult for marginal farmers to supplement their home production with products gleaned from nature.

In 1839 the tenant farmers appointed a committee to represent them to Stephen Van Rensselaer IV. These were no landless proletarians; the men who were chosen to speak were largely good burghers, 65 percent of whom were forty years of age or older. They were almost all farmers of some wealth, chosen to represent the area's ethnic diversity (English, Dutch, and German immigrants). They had political experience, through leadership positions in their churches, in town offices, or in county-level political parties. They called for their rent arrears to be forgiven, and they also hoped that they would be able to convert their rental contracts to mortgages. They were unwilling to grant the patroon families any compensation for the feudal services they would lose, although they did agree to mortgage values that represented the loss of the perpetual rents. Stephen Van Rensselaer refused their request, adding insult to injury by accusing them of attempting to renege on legal contracts.

On July 4, 1839, the aggrieved tenants crafted their reply—a manifesto in the form of the Declaration of Independence, which set forth their grievances and promised that the rent would not be paid. It was the first, rhetorical, shot fired in what came to be called the Helderberg War, after the Helderberg Mountains of the region. Men who had been deputized to serve warrants on behalf of the landlords were threatened with tar and feathers. Others had to perambulate from one tavern to another, buying drinks for the angry mob. On other occasions, people with sympathy for the landlords were held captive until they agreed to shout the motto of the Anti-Renters: "Down with the Rent!" The war finally abated when Governor William H. Seward threatened the rebels with violence and promised legislative action to consider their concerns.

Anti-Rent and Politics

When Governor Seward appointed the Manor Commission to consider the question of the leases-in-fee, the concerns of the Anti-Renters began to intersect with larger political changes taking place in the nation. The 1840s were a key moment for reformers; white men of little property now had the vote, and the political parties were in flux, so that reform groups could court either party, or both. Ideologically speaking, rank-and-file Anti-Renters had most in common with the Democrats, who argued against monopolies of all kinds. The Bank War of the mid-1830s had been predicated on just this type of opposition. But the tenants were not completely given over to the Democrats. Many of the landlords were Democrats. The landlords insisted on strict construction in interpreting the Constitution because the Contracts Clause prevented any legislative meddling with the power of free individuals freely to contract.

Furthermore, many Anti-Renters believed, along with the Whig party, that government intervention in the economy was necessary to promote social happiness. As the Anti-Rent war developed, the Whigs set forth a potent justification for opposing the feudal titles: that they interfered with a free market in land, the only thing that would ensure the proper economic development of upstate New York. The Manor Commission, populated largely by Whigs, endorsed the Anti-Renters' view of the contracts as oppressive and suggested that the government's power of eminent domain might be used in order to assume stewardship of the land. Unfortunately for the Anti-Renters, these ideas were not successfully translated into action.

Anti-Rent as a Popular Movement

In 1843, William Van Rensselaer, one of Stephen Van Rensselaer's heirs, began to sue his tenants for back rents. The tenants fought the lawsuits with lawsuits of their own. They investigated the patroons' titles and found many areas of weakness in them, including the absence of certain boundaries and the failure of the grantors to fulfill all of their responsibilities. But they were unable to use these weaknesses against the patroons because nothing could excuse the tenants from their obligation to pay rent. Legislative attempts to abrogate the contracts failed when, in 1843, the Supreme Court found unconstitutional any legislation that tended to hinder the enforcement of contracts.

The inability of the Anti-Renters to gain redress through the legislature or the courts caused them to switch tactics again in 1844. Charismatic speakers like Smith Boughton, a doctor with previous radical experience fighting to free Quebec, circulated through the mountain towns, encouraging the tenants to withhold their rent and to form organizations for the promotion of the cause. They also promoted Anti-Rent candidates for the New York State Assembly. By 1845, there were between 25,000 and 60,000 Anti-Rent supporters in eleven counties.

The Anti-Renters also began to model their movement after highly successful evangelical reform movements such as temperance and abolition. They had their own newspaper, the *Albany Freeholder*, which reported on the movement's doings and encouraged Anti-Renters through its documentation of their united strength. Balladeers wrote songs and poems that celebrated Anti-Rent ideas and commemorated the Helderberg War. People who identified with the Anti-Rent cause could express this element of their identities by joining the legally focused Anti-Rent associations, supporting the nexus between Anti-Rent and party politics, or even joining the enforcement arm of the movement—the "Indians."

The Indian bands were coordinated groups of neighbors, presided over by "chiefs" at the neighborhood and town level. Unlike members of the Anti-Rent associations, who were older and more respectable, more than half of the "Indians" were under thirty and owned little property. Their relative poverty was only partly a function of life stage, since the Indians were coming of age at a time when earning a competency from the land was becoming more and more difficult. Since their function was to intimidate and act in raucous ways, the Indians had a lot in common with the early modern ritual of the charivari, a ceremonial harassment of newlyweds or similar notables by local men and boys. The ritual was a holdover from premodern Europe that persisted in rural America. The rite was designed to accommodate change in a community and used as an ad hoc form of social control with a complex ritual world. The Indians concocted their own language. They created their own costumes, which were more than just feathered headdresses; they wore full masks with ears that resembled animals or devils, and long, nightgown-like outfits of multicolored calico decorated with furs and beads. Indian identity provided a focus for young men in the mountain towns to celebrate their masculinity and, since Indians were thought of as "pre-political," to hark back to a time before the patroon land grants.

The Indians were not benign and quaint relics of

early modern Europe; contemporaries both within and outside the movement saw them as a threat to the public order. In December 1844, two men were killed in separate incidents by Indians firing guns at Anti-Rent rallies. Then, on August 7, 1845, Indians interrupted a distress sale of farm equipment intended to satisfy creditors, and killed Sheriff's Deputy Osman Steele. In the wake of this homicide, Governor Silas Wright declared three New York counties to be in rebellion. Posses circulated through the towns of Delaware County, arresting suspected Indians and forcing others to flee. Two of the eighty-four Indians convicted were sentenced to hang for the murder of the deputy, and the Indian violence, which had been a highly effective deterrent to distress sales, stopped.

The Anti-Rent Ideology

In 1844 and 1845, at the same time that the Indians were being stamped out, the Anti-Renters began in earnest to express an ideology as well as a grievance. They developed their ideology in tandem with the National Reform Movement to gain homesteads for workers—a movement founded in New York in 1844. The National Reformers numbered among their ranks gifted writers and working-class theorists like George Henry Evans, trade unionists like John Commerford, and even the former Newcastle Chartist Thomas Devyr, whose close connection with Anti-Rent would bring to the movement a world of British radical experience. The National Reformers, through their newspaper, the *Working Man's Advocate*, later *Young America!*, drew from a whole genealogy of theorists who propounded people's natural right to the soil. The fact that a person was alive, they claimed, meant that one had a right to the wherewithal needed to live—and this included the soil.

The National Reformers recognized the opportunity to expand their constituency, and sent their own lecturers to upstate New York, where they promoted Anti-Rent as a natural part of a larger movement against land monopoly. Thus, the Anti-Renters not only were able to develop their ideology in more detail, but also signed their names to petitions calling for free homesteads, exemption of the homestead from distraint for debt, and limitation on the amount of land that any one man could own. What had started as a provincial movement in response to some discrete conditions in upstate New York was becoming a national—and with the Chartist connection, an international—land reform movement.

By spring 1845, the Anti-Renters had decided that their only entry into politics would be by running independent Anti-Rent candidates; Whigs or Democrats were simply not amenable to the discipline that was necessary to get Anti-Rent goals accomplished. In the autumn of 1845, Anti-Rent candidates won control of the governments of three counties and seven seats in the New York State legislature. The Anti-Rent movement was able to achieve the passage of two laws in 1846 that limited landlords' right to oppress distressed tenants and also taxed landlords' rental income. Even more was accomplished at the 1846 New York Constitutional Convention, which promoted short leases and free trade in land. Unfortunately for the leaders of the Anti-Rent movement, however, many constituents had moved on to consider the essential injustice of land monopoly and feared that these changes would do little to address underlying inequalities.

Throughout 1846, there were attempts—successful in some counties—to fuse Anti-Rent with the more thoroughgoing critique of private land ownership put forth by the National Reformers. Some of the most prominent Anti-Renters, including Smith Boughton and Thomas Devyr, led this shift. But it would be wrong to accuse these men of "agrarianism" or lack of respect for private property, or to see them as backward looking. They were strong believers in economic development, yet they knew that a free market in land would prevent the widespread independent proprietorship that could create a level playing field in America. The year saw a second electoral victory for the Anti-Renters, with eleven seats captured in the assembly, but the split between radicals and more moderate reformers remained.

Decline of the Anti-Rent Movement

During the 1847 legislative session, Anti-Renters saw a New York Assembly Select Committee on leasehold estates endorse not only specific anti-leasehold legislation, but also the general natural-rights argument that the National Reformers propounded. Despite this support, Anti-Rent bills repeatedly failed in the legislature. The energy of the movement began to dissipate in various directions. Some Anti-Renters began to renew their support of the National Reform movement, and some combined land reform with abolition to endorse the new Free Soil Party. At the same time, landlords continued to be effective at fighting off any challenges to the legitimacy of their titles.

Having met permanent obstacles in the legislature and been transformed on its radical wing into the quest for free homesteads, the Anti-Rent movement took a long time to die out. The radical wing of the

Anti-Rent movement went further than denouncing rents and called for free homesteads for every farm family. In 1851, the Supreme Court of New York dismissed lawsuits against the patroons' titles, acknowledging that, although old frauds were bad, allowing the state to tinker with contracts was worse. Some challenges to the rent system persisted into the 1880s, but for the most part the 1851 decision deflated the movement. Its remaining newspaper, the *Anti-Renter*, which had been ably led by Thomas Devyr, folded, leaving the movement without feedback or direction.

In the end, the social revolution promised by Anti-Rent was incomplete. The landholding patterns of the manor towns did change, but the value of independent proprietorship and the importance of contracts did not. Once the depression of 1837–1842 had abated, some of the more prosperous farmers bought their lands outright from the landlords. Other, more marginal farmers had been forced off their lands after the Indians were no longer around to protect them. Landholding in upstate New York was substantially more democratic and fitting of a republic than it had been, but change was achieved through continued recognition of the hated contracts. Even so, the more idealistic land-reforming ideas of the Anti-Renters and the National Reformers did not die. One of the most radical ideas in the movement, that every free white American had a natural right to the soil, persisted into the 1850s. By the middle of that decade, "land for the landless" and "homes for the homeless" had become part of the platform of the new Republican Party. The old New Yorkers who had railed against land monopoly lived to see their ideology encapsulated in the Homestead Act of 1862.

Southern Exodusters Movement

1860s–1870s

In 1879, an African-American man from Louisiana wrote a letter to the governor of Kansas that read in part: "I am very anxious to reach your state, not just because of the great race now made for it but because of the sacredness of her soil washed by the blood of humanitarians for the cause of black freedom."

This man was not alone. Thousands of African Americans made their way to Kansas and other Western states after Reconstruction. The Homestead Act and other liberal land laws offered blacks (in theory) the opportunity to escape the racism and oppression of the postwar South and become owners of their own tracts of private farmland. For people who had spent their lives working the lands of white masters with no freedom or pay, the opportunities offered by these land laws must have seemed the answer to prayer. Many individuals and families were indeed willing to leave the only place they had known to move to a place few of them had ever seen. The large-scale black migration from the South to Kansas came to be known as the "Great Exodus," and those participating in it were called "exodusters."

Conditions in the Postwar South

The post-Civil War era should have been a time of jubilation and progress for the African Americans of the South. Slavery, officially abolished in 1865, was nothing more than a bad memory; the Fourteenth Amendment to the Constitution had granted them citizenship; and the Fifteenth Amendment outlawed suffrage discrimination based on race, color, or previous slave status. However, many Southern whites sought to keep blacks effectively disenfranchised and socially and economically inferior.

One way whites in power attempted to prevent black equality was through denial of African-American participation in the political process. Freed blacks were great supporters of the Republican Party, which was the party of Abraham Lincoln and emancipation. Much of the white South, however, remained loyal to the Democratic Party and professed hatred for all Republicans, black or white. When blacks turned out in droves to cast their ballots for Republican candidates, they were often met at the polls by whites employing creative means to keep the African Americans from ever seeing the inside of the voting booth. Many African Americans were prevented from cast-

***Ho for Kansas!* is a representation of African-American farmers migrating from the South to Kansas and other Western states to stake out land for their own farms.** *(Library of Congress)*

ing their ballots and assuming their places as full members of the society. In addition to maintaining some semblance of the postwar balance of power, these methods also helped elect white Democrats.

Economic obstacles unique to their condition also prevented many freed blacks from moving ahead. After having been slaves for most of their lives, they knew only how to be farmers. Even for those who did possess or acquire alternative skills, the region's lack of alternatives to farming as well as determined white supremacy blocked the freedmen's advance. As farmers, they had no money to purchase land of their own, and many were actually forced to go back to work for the very same whites who had held them in bondage for so many years. The only difference was that the white landowners now paid them with a share of the crop which, after deductions for food and other necessities, amounted to a ridiculously low wage for their work. Although this did not technically constitute a master-slave relationship, it likely seemed hardly better than one to the African Americans who had to endure such humiliation and frustration. Many of the freed blacks had few other skills, however, and often had families of their own to support. It must have seemed a no-win situation.

The era of Reconstruction in the South lasted from 1865 to 1877. During these years, federal troops occupied the states of the former Confederacy to ensure compliance with the laws and regulations governing the Southern states' reentry into the Union. Although the protection these troops provided to African Americans was often minimal, it had been better than nothing. When President Rutherford B. Hayes ended Reconstruction in 1877 and pulled the U.S. troops out of the South, the white ruling class of the South had free reign to terrorize and oppress freed blacks without interference from the U.S. Army or anyone else. Murders, lynchings, and other violent crimes against blacks increased dramatically. It was likely at this point that many African Americans began to feel that leaving the South forever was their only real chance to begin new lives. Movement to parts further west, such as Kansas, began almost immediately after the end of Reconstruction.

Black Migration to Kansas Prior to the Great Exodus

What was it about Kansas that particularly attracted African Americans to that state? At the time many blacks began to consider abandoning the South, there was certainly a good deal of frontier land available elsewhere. Besides slick (and often misleading) promotion of town sites, what drew freedmen and -women to Kansas?

First, purely logistical and geographic factors must be considered. Kansas, though certainly never considered a part of the South (except by pro-slavery Missourians prior to the Civil War), is much closer to the South than far-off spots like California and Oregon. Getting to Kansas was a much simpler and less expensive task than getting to such faraway places. For those coming from many parts of the South, a boat or train ride to St. Louis was the real beginning of their journey to Kansas. Although conditions on these boats and trains were never ideal, riding in any form was certainly preferable to walking. Many arrived in St. Louis with little idea about how they would get across Missouri and into Kansas. They must have felt, however, that whatever hardships they faced on that leg of the journey would be less onerous than those left behind in the South.

Another factor—a human one—also played a role in the selection of Kansas as the new Promised Land. The exploits of antislavery activists like John Brown gave Kansas an almost holy sacredness to many African Americans. In Kansas, blood had been spilled to keep slavery out. The memories of John Brown and other abolitionist warriors lived on in the hearts and minds of freedmen and -women and made Kansas seem the ideal place to begin anew.

Many of the African Americans who migrated to Kansas prior to the 1879 exodus came from Tennessee. There a popular movement had sprung seemingly from nowhere in 1874, leading to a "colored people's convention" in Nashville in May 1875. Many town promoters, including the notable Benjamin "Pap" Singleton, saw this convention as a way to convince people to migrate to Kansas. The convention resulted in the designation of a board of commissioners to officially promote migration to Kansas. This board would later stipulate that would-be migrants needed at least $1,000 per family to relocate to Kansas; very few interested in doing so had such funds. Nevertheless, many freed blacks determined to leave Tennessee anyway. Promoters like Singleton became known as "conductors" and began leading African American families to Kansas.

Obviously, black migration to Kansas did not begin (or end) with the exodus of 1879. Thousands of freed blacks made their way to Kansas throughout the 1870s. Since their migration was more gradual, however, few whites took notice. This was certainly not the case when the well-publicized exodus took place in 1879.

The Exodus of 1879

The great exodus of African Americans in 1879 was largely influenced by the outcome of the elections of 1878 in the state of Louisiana, in which the Democratic Party made major gains by winning several congressional seats and the governorship. Freed blacks, largely Republican supporters, were coerced, threatened, assaulted, and even murdered to keep them away from the ballot box. When the final tallies were in and the Democrats claimed almost total victory, many black Louisianans knew that the time had come for them to abandon their state and join those already in Kansas. Senator William Windom, a white Republican from Minnesota, introduced a resolution on January 16, 1879, which actually encouraged black migration out of the South. The Windom Resolution, together with Southern white bigotry and the letters and newspaper articles of those blacks already in Kansas, led many Southern freedmen and -women to finally decide to make their way to Kansas. By early 1879, the "Kansas Fever Exodus" was taking place.

The 1879 exodus removed approximately 6,000 African Americans primarily from Louisiana, Mississippi, and Texas. Many had heard rumors of free transportation all the way to Kansas, but they were sorely disappointed when they discovered that such a luxury did not exist. Very few, however, were dissuaded by this inconvenience.

Many Southern whites had a racist and patronizing attitude about blacks in general and the exodus in particular. As much as whites hated dealing with freed blacks, they still wanted the former slaves there as a cheap labor force. Many Southern whites became so alarmed by the exodus that they began to pressure their elected officials to put a stop to it. They eventually succeeded, and a U.S. Senate committee met for three months in 1880 to investigate the cause of the exodus. The committee disintegrated into partisan bickering and accomplished little.

Nonetheless, blacks continued to leave for Kansas. By early March, about 1,500 had already passed through St. Louis en route to Kansas. Back in Mississippi and Louisiana, thousands more crowded onto riverbanks to wait for passing steamers to give them passage to St. Louis. One white man stated that the banks of the Mississippi River were "literally covered with colored people and their little store of worldly goods [sic] every road leading to the river is filled with wagons loaded with plunder and families who seem to think that anywhere is better than here."

Once in St. Louis, many of the exodusters had little idea how to continue their flight with no resources. Some were so destitute that they could not feed themselves or their families. In response, St. Louis clergy and business leaders formed committees to assist the freed blacks so that they could survive and get to Kansas. Food and funds were collected from the local community as well as from sympathizers from Iowa to Ohio. Lack of shelter, however, became the most serious problem, and many blacks were forced to sleep outside near the waterfronts to which the steamships had delivered them. Care of the exodusters in St. Louis became a political issue, especially after the Democratic-leaning *Missouri Republican* began running antiblack stories and tales of mishandling of donated funds. By the time the last of the exodusters departed St. Louis by rail, wagon, boat, or on foot, even the most sympathetic citizens were likely happy to see them go.

Back in the South, more African Americans continued to plan to depart for Kansas. Black social leaders and ministers often sang the praises of the exodus, comparing it to Moses and the Israelites' escape from Egypt. Of course, some black leaders spoke out against the exodus as well, stating that those leaving for Kansas were jeopardizing the future of those who chose to stay behind and that democracy should be given more time to work. Among the most notable of those who tried to dissuade blacks from fleeing the South was Frederick Douglass.

Southern whites continued to oppose the exodus as well. Many went to extreme measures to try to keep blacks from emigrating, including arrest and imprisonment on false charges and the old standby of raw, brute force. African Americans suffered beatings and other forms of violence at the hands of whites desperate to keep them in the South. Although these typical forms of intimidation did not deter many freed blacks from leaving, the eventual refusal of steamship captains to pick them up did. One can only guess that at least some of these sailors had been threatened or paid not to offer blacks passage to St. Louis.

End of the Exodus

The exodus began to subside by the early summer of 1879. Although some African Americans did continue to head for Kansas, the massive movement known as the exodus basically ended with the decade of the 1870s. That ten-year period had witnessed great changes for blacks both in the South and in Kansas. In 1870, Kansas had hosted a black population of ap-

proximately 16,250. Ten years later, in 1880, some 43,110 African Americans called Kansas home. Between the earlier gradual migrations and the 1879 exodus, Kansas had gained nearly 27,000 black residents in ten years. Though a far greater number of blacks remained in the South, this number still represents 27,000 individual dreams of a better life and 27,000 people who acted on their desires and their rights to enjoy the freedoms to which they supposedly had been entitled since the Emancipation Proclamation. Few found Kansas to be the Promised Land for which they hoped; yet it was a place that enabled them to live freely and with much less racial interference than in the South.

Grange Movement

The Order of Patrons of Husbandry, as its founders named it in 1867, is generally called the Grange, which is officially the term for its local, county, state, and national units. Members, both men and women, have always been farmers and a variety of other, mostly rural, people. Its purposes, also diverse, have been social, educational, broadly reformist, and briefly, in some of its early years, economically radical. Its size has varied enormously. In 1875, it claimed to have 858,050 members, which was close to its all-time peak. Late in that year the National Grange *Proceedings* reported 761,263 members spread over thirty-six states, several western territories, the District of Columbia, and Canada. Numbers had begun to move downward then, but they were still big, especially in the Ohio River Valley. The allure of its cooperatives and the discounts members received from Montgomery Ward and other vendors had made the Order popular. Then, as the longest depression that the United States had yet experienced dragged on, the Order's economic attractions weakened. Membership dropped precipitously, but the Order did not die. It recovered, becoming what historians have called the Second Granger Movement. Although it inspired enthusiasm among a wide range of reformers, including women who wanted suffrage for themselves and moral betterment for their communities, its growth was slow through the 1890s, perhaps because many rural people who wanted economic reforms were then drawn to the Farmers' Alliances and the People's Party. The Order grew more rapidly in the twentieth century. In 1952, according to Grange leader and historian David H. Howard, membership reached a new high: 858,105. Then it fell. Now, according to the Order's website, membership is about 300,000. It remains, as the Second Granger Movement has consistently been, a social organization with a wide range of reform interests that are connected mostly with rural life.

The First Grange Movement

Oliver Hudson Kelley, a restless Bostonian who became a Minnesota farmer in 1849, was the Order's principal founder. Kelley had claimed Minnesota land near Itasca, which he hoped would become the territory's capital, but Minnesota's legislature decided to let St. Paul keep that honor. Defeated as real estate speculators, Oliver and Lucy Kelley made a difficult start as farmers; she died while delivering their first child early in 1851. But Oliver stayed on the land and soon married Temperance Lane, a fellow Massachusetts migrant who had been teaching in Anoka, Minnesota. Though a novice farmer, Oliver tried to be progressive. He studied agricultural literature, which was burgeoning then, and helped to found Minnesota's first agricultural organization, the Benton County Agricultural Society, in 1852. He hoped, as did organizers of a great many other agricultural societies in his time, that it would help to educate farmers.

In 1864, Senator Alexander Ramsey got Kelley appointed a clerk in the U.S. Department of Agriculture. Trying to farm in Minnesota and work in Washington, with a great deal of help from Temperance who stayed on the land, Kelley wrote articles for the Department of Agriculture and several newspapers. Then, in 1866, he was called upon to survey the condition of Southern agriculture. Kelly, a Democrat sympathetic to the defeated South, spoke with Andrew Johnson before the president's Southern tour. Johnson wanted Kelley, whose writings urged migration to Minnesota, to similarly promote the South and so contribute to its recovery. Kelley tried to do that. Moreover, historians have often taught, his Southern tour inspired him to found the Grange.

Inspiration is said to have begun with the cordiality that fellow Masons in the South showed to Kelley as a fraternal brother, Yankee though he was. Freemasonry, brought to Britain's American colonies from Europe, had about 446,000 American members

in 1870, which was more than twice the number in 1860. The great fraternity, with its rituals and secrets, was enjoying an enormous boom. Kelley recalled in his book, *Origin and Progress of the Order of the Patrons of Husbandry in the United States* (1875), that something like it could be a healing bond between Southern and Northern Americans and, like the existing agricultural societies, an instrument of agricultural education and progress. Those ideas, as historians have repeatedly reported, following Kelley's book, inspired him to found the Grange.

Other historians, informed by Kelley's journal as well as his book, have suggested that he envisioned an agricultural fraternity before visiting the South. His purposes, in their view, were not only social and educational. Historian Thomas A. Woods argued in 1991 "that the Grange originated as a radical organization," which sought "legislative controls on monopoly capitalism."

Kelley did not shape the organization alone. His friends in Washington, D.C., where he worked for the Post Office Department in 1867, also played important founding roles. William Saunders, chief horticulturist for the U.S. Department of Agriculture, wrote the Order's national constitution, including its eloquent preamble, which lauded agriculture and knowledge in the style of contemporary agricultural societies. John R. Thompson, a high-ranking Mason, helped to shape Grange ritual. The Rev. Aaron B. Grosh, a Universalist minister, wrote prayers and collected songs for use in Grange meetings. Francis M. McDowell was the Order's financial planner.

Caroline Hall, Kelley's niece, was not among the founders in Washington, but in 1892 the National Grange honored her as "equal to a founder." In his own history, Kelley recalled that full membership for women "ORIGINATED WITH HER." All of those founders and the near founder gave the Order a moral tone and a focus on social, cultural, and educational objectives. From late 1867 through January 1868, that tone and focus prevailed when the organization was being shaped in Washington. There the Potomac Grange became its first local unit, and its members began the National Grange.

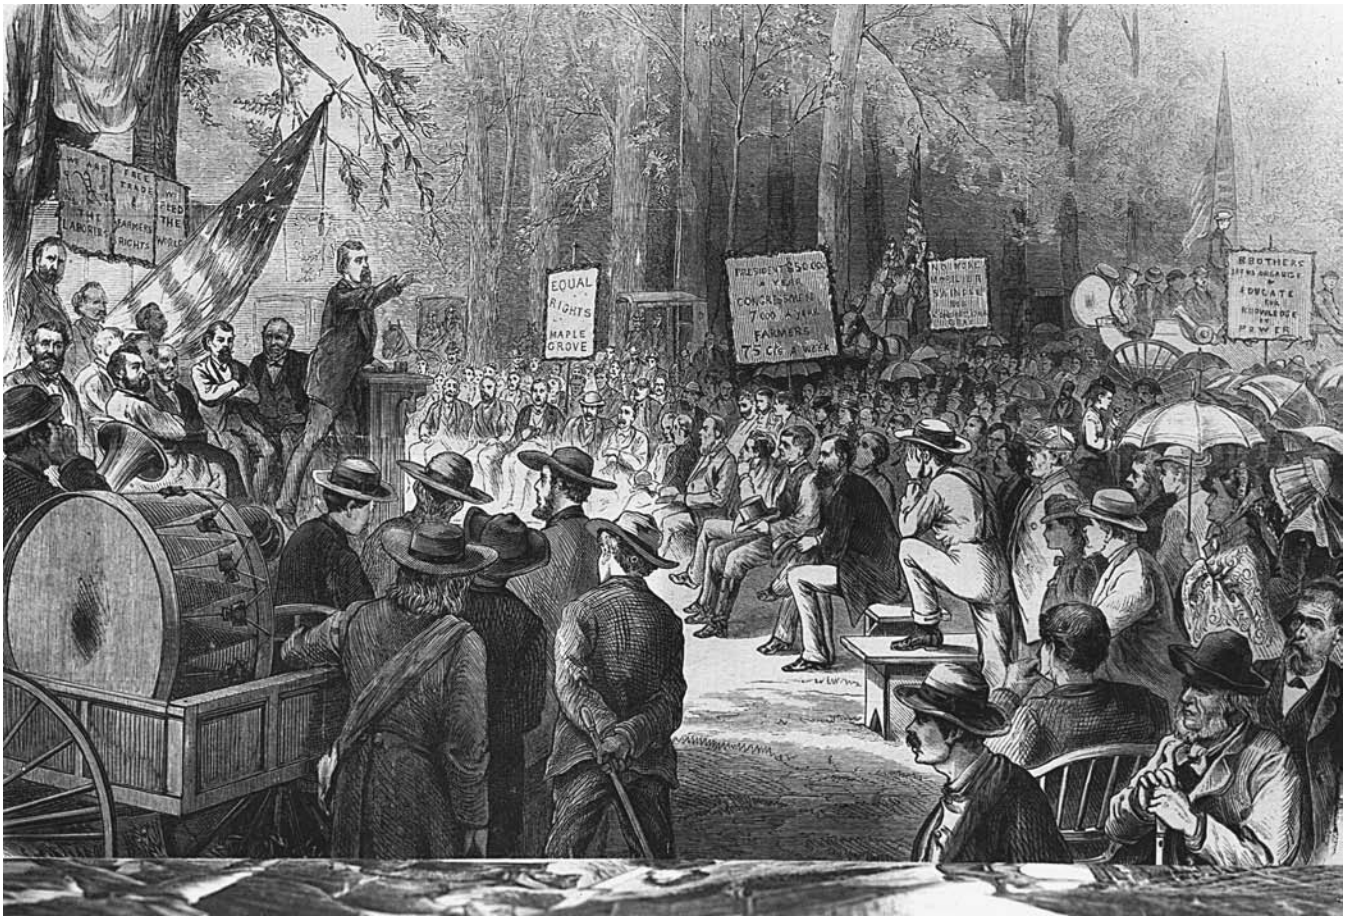
Then, in April 1868, Oliver Kelley left Washington. He founded only one durable local grange, in Fredonia, Chautauqua County, New York, on his way home to Minnesota. Other attempts to start granges on that trip failed, so Fredonia's grange has sometimes been honored as the "First Farmers' Grange in the World." Few of its members, however, were farmers. The organization's first Lecturer, responsible for educational programs, later recalled that he took his office because the other members were also "village people, who cared no more about farming than I did." Woods believes that "Only when Oliver Kelley reached Minnesota" did the Order's "lasting work among the farmers themselves" finally begin. Then, too, Charles M. Gardner, Grange leader and inside historian of the mid-twentieth century tells us, Temperance Kelley "probably saved the Grange" by giving her husband a $500 legacy which she had received during his long absence and which might have been enormously helpful to her and the farm for which she had taken day-to-day responsibility.

Soon Kelley organized two granges near that farm: Granite and Cascade Grange. Neither lasted through 1868, and neither demonstrated that Kelley's movement was exciting widespread or grassroots interest. Most of the Granite Grange members—thirteen men and an unstated number of women—were personal friends of Kelley's. Apart from J.S. Pillsbury, a miller who had already achieved business importance and would later be Minnesota's governor, everyone in the Cascade Grange had become acquainted with Kelley in 1866, when he and they started the Minnesota Fruit Growers' Association. Despite the cooperation that Kelley got from newspapers, notably the *St. Paul Pioneer*, and from agricultural journals, and despite Kelley's passionate class appeals to farmers, his movement had no durable results through the summer of 1868. Then, in September, he started North Star Grange in St. Paul, with fifteen male members.

North Star Grange was important not only because it lasted, soon becoming the state's Grange No. 1 when the first two granges collapsed, but because Daniel A. Robertson, one of its leaders, joined Kelley in rewriting the Order's circular to farmers, promising to build a "co-operative association for individual improvement and common benefit." Then the Order began to grow. It had thirty-six local granges in Minnesota, where it had also formed a state organization, by the end of 1869. By that time, too, it had five local units in other parts of the Midwest: two in Illinois, two in Indiana, and one in Iowa.

The Order began to boom in the 1870s. Daniel A. Robertson volunteered to serve as a deputy and a traveling recruiter; many more deputies, all over the United States and moving into Canada, then enlisted. In 1873, the most spectacular year of growth, 8,667 granges were founded.

At the end of 1873, the Order had more than 10,000 granges in thirty-one states, Quebec, and On-



Grangers assemble at a meeting in Ohio in 1873 to air their grievances and increase their influence. Founded in 1867, the Order of Patrons of Husbandry, as the group was formally known, consisted largely of farmers and rural residents. *(Brown Brothers)*

tario. Growth continued, at a slower pace, into 1875 when the National Grange nearly reached the all-time peak of its membership. Growth owed much to enthusiasm for a wide range of cooperative enterprises that began in 1869 when some leaders of the Minnesota State Grange created a business agency. Hoping to create an assortment of cooperatives, the agency got its first practical results by approaching businesses that dealt with farmers and, in exchange for discounts, helping them to reach grange members. Montgomery Ward, which called itself the "Original Grange Supply House," was not alone in seizing that opportunity. In 1875, Indiana's State Grange agent claimed to have participated in distributing more than $300,000 worth of farm implements, sewing machines, footwear, groceries, and other goods. A year later, his counterpart in the Ohio State Grange claimed that the people he served were getting discounts of 50 percent on sewing machines, 45 percent on garden seeds, 25 percent on footwear and fruit trees, and abundant savings on lots of other goods. However much grangers really saved, such claims surely helped to sell membership in the Order.

Rising membership also inspired entrepreneurial and political interest. In 1874, Master of the National Grange Dudley W. Adams, an Iowa farmer, protested that the Order was infested with "speculators, demagogues, small politicians, grain-buyers, cotton-factors, and lawyers." He wanted to purify the Order, making it an organization of farmers exclusively.

Perhaps that goal was consistent with what William Saunders, author of the Order's constitution, had in mind when he wrote that membership was for people "engaged in Agricultural pursuits." But when the St. Paul, Minnesota, North Star Grange asked whether city folks could join, Kelley welcomed them warmly. Urban ladies who "love flowers and summer visits to their rural friends" were, Kelley thought, particularly

valuable to the Order. Then the constitution was amended to state that members had to be "interested in agricultural pursuits." Of course, flower-loving ladies and the sorts of members who irked Dudley W. Adams had many ways of being interested in agriculture.

The Order was a diverse collection of people, both in its early days and when membership boomed. It only lacked recent immigrants, Catholics, members of the Protestant denominations that distrusted fraternal societies, and black people. Some Southern grangers created a parallel black organization, the Council of Laborers; D. Sven Nordin, an important historian of the Grange who studied in Mississippi, tells us that the Grange there "was often a front for the Ku Klux Klan." Then in the mid-1870s, the Order tried to limit its diversity much further. In 1875, its constitution's original phrase, "engaged in Agricultural pursuits," reappeared. Then the executive committee of the Wisconsin State Grange told a local grange master that he should not admit a rural minister. Grangers had to be farmers.

That lasted very briefly. The Order recruited people who were "interested" in agriculture again after membership took a dramatic drop beginning in 1875. It was down to 124,420 in 1880. People left for several reasons, some of which were surely related to the big depression that started late in 1873 and continued for sixty-five months, longer than any previous American economic downturn. Hard-hit farmers became reluctant to pay dues, which some felt state and national Grange leaders to be wasting, and they turned away from Grange cooperatives, which suffered because of both the depression and falling Grange membership. Some members left the Grange, D. Sven Nordin suggests, because they thought that it had achieved all that it could. A few state and federal laws, notably railroad regulations, satisfied some members. Other people, including Grange founders, left for simply personal reasons. William Saunders, author of the Grange constitution, left in 1875 when the Order moved its headquarters from Washington to Kentucky; Oliver Kelley stopped being secretary of the National Grange in 1878 because, he explained, he wanted to devote his time to Florida real estate speculation. He had been losing influence and interest in the Grange for several years by then. Members and some leaders wandered away, but the Order did not die.

The Second Grange Movement

D. Sven Nordin persuasively suggests that the "second Granger Movement" was "in the long run quite probably more significant than the first one." Its significance came in the "long run" because it did not grow rapidly in the late nineteenth century. According to the figures collected by Charles M. Gardner, who was High Priest Emeritus of the National Grange when the Order published his *The Grange-Friend of the Farmer, 1867–1947* (1949), membership was just above 200,000 in 1893 but did not stay above that level for successive years until 1902. Then it moved rather steadily upward. Soon after World War II, the Second Movement became approximately as big as the first had been at its height in 1875. Before that happened, while its numbers were still down in the nineteenth century, it experienced important changes in its regional distribution.

D. Sven Nordin tells us that the first movement at its height had only 13 percent of its members in Ohio, Pennsylvania, New York, and New England. That region had 41 percent of the members in 1880 and 83 percent when the twentieth century began. Oregon Grange leader David H. Howard reports, in his 1992 history of the Order, that membership at the end of the 1960s was greatest in the Northeast, the Northwest, Kansas, and Ohio. Long an important Grange state, Ohio had the largest membership then, but not in the 1970s, when leadership passed to Washington. As membership began what has since been a rather steady decline, a problem shared with many voluntary organizations, most of the states with increasing membership were in the Northwest. The other states where the Order mattered were mostly in the Northeast.

The second movement also differed from the first in terms of women's importance. When the Order began, women held few offices. Their only important activities, other than food preparation, were recitations as the Roman graces Ceres, Pomona, and Flora, on the blessings of grain, fruit, and flowers. The 1869 handbook for local granges called the "graces" officers, which they do not seem to have been at the outset, but gave them no functions other than speaking a few prescribed words about the glories of flowers, fruit, and grain at local meetings. Women had nothing to do or say in state and national granges until 1873 when "four ladies honored" the National Grange by attending its meeting in Oliver Kelley's home, which was then in Georgetown, D.C. The Order's constitution, revised at that meeting, said that women who

had "taken the degree of Pomona," the most advanced then available to them, and were married to state grange masters, were welcome at future National Grange meetings.

Clearly, women's participation in early Grange meetings was purely ceremonial and essentially unimportant. That was illustrated in 1875 when participants in the Wisconsin State Grange meeting cast 253 votes for their master and 35 for Pomona. Scant votes for women officers meant that men, the big majority of participants in early meetings, let women choose their own officers. Perhaps men considered women's roles practically unimportant, but they did not act upon the suggestion that the Order should eliminate women from membership. Women stayed in the Order and soon, in a few places, carved out important roles.

That was notably true in Michigan where Mary Mayo played just such a role. Mayo started her Grange career in Pomona's ceremonial role but began lecturing on the Chautauqua Literary and Scientific Circle in 1877. She later addressed granges all over Michigan and often wrote for the *Grange Visitor*, the monthly Michigan State Grange journal. Founder and long chair of the Michigan State Grange Committee on Woman's Work, and deputy lecturer and chaplain of the State Grange, she was active in the Order almost until she died in 1903. She spoke and wrote mostly about morality, education, food, and housekeeping. Politics and suffrage for women little interested her. Mayo's successor, on the other hand, boldly embraced such causes.

Mayo's successor as chaplain of the Michigan State Grange, Olivia Woodman, was a Universalist minister and a vigorous Progressive. Woodman advocated women's suffrage, prohibition, conservation of nature, laws to protect children from dangerous exploitation as workers, and other Progressive causes. Another contemporary, Jennie Buell, brought her literary energy to all of the reforms that interested both Mayo and Woodman and to Swedenborgian philosophy as well. Her books, including a reverent little biography of Mary Mayo, and her articles in Michigan's *Grange Visitor*, *National Grange Monthly*, *Good Housekeeping*, *American Agriculturist*, and other magazines reached a widespread audience. Other women who were important to the Order became masters of local granges, starting in Howard County, Indiana, in 1877. More big steps came in 1895, when Sarah G. Baird began her seventeen years as master of the Minnesota State Grange, and 1986, when Jeanne Davies, master of the Colorado State Grange, became the first woman member of the National Grange executive committee.

Although regional distribution and gender roles changed, the Order stuck to its broad range of traditional concerns. They included and still include what Master of the National Grange Robert Barrow called in 1987 the "increasing concentration" of American agriculture which "poses a threat to the continued viability of the small- and medium-size family farmers and the rural communities they support." A banker and professional singer, not a farmer, Master Barrow resembled many other grangers, who were and continue to be "interested" rather than "engaged" in agriculture. Such nonfarmer Grange members have demonstrated a desire to help farmers economically and to meet their needs for education, healthcare and insurance, and roads. Moreover, grangers have been and remain conservationists of nature's beauty and resources; Gifford Pinchot, President Theodore Roosevelt's chief forester, was a granger. His tradition continues. Finally, as the resolutions passed at the 135th Annual Convention in 2001 demonstrated, grangers have broad public policy concerns that reach beyond farming. They called for "more prominent alcohol warning labels" and endorsed "stem cell research that involves naturally aborted fetuses and unused harvested embryos."

Conclusion

The Order of Patrons of Husbandry has now existed for well over a century. Membership, regional distribution, women's roles, and the particular issues that engage its attention have varied over time, but some traditions have continued with fair consistency. Predominantly rural but not exclusively for farmers, despite the purist hope of some early leaders, the Order has always wanted to serve farmers' economic interests. That goal meant a kind of radicalism in its early days; today it means lobbying Congress for policies that may help to block the concentration of agricultural wealth in fewer and fewer hands. Moreover, the Order has always interested itself in a wide range of issues, not all directly connected with farming, and has offered its members a diverse assortment of services. Now Montgomery Ward is gone, but other merchants give grangers discounts on computers, pharmaceutical products, hearing aids, and a good many other products and services. The Order itself offers credit cards, insurance, and, of course, a cookbook. Abundant information about current ideas and services is available to prospective members and the inquisitive public at http://www.nationalgrange.org.

The Order has made available a great deal of information about Grange history, and has published several historical studies. In 1961, it donated Oliver, Lucy, and Temperance Kelley's farm to the Minnesota Historical Society to serve as a museum. Despite the Order's many efforts to explain its organization and objectives and win adherents, membership is not presently at one of its peaks. But grangers, knowing their history, are aware that they have faced that problem before.

Farmers' Alliance Movement

The Farmers' Alliance was the first mass agrarian protest movement in the history of the United States and one of the largest mass movements in American history. The brief life of the Alliance left an enduring legacy of economic self-help, political activism, and moral reform, and led directly to the rise of the Populist Party.

The Farmers' Alliance had its beginnings in Lampasas County, Texas, in 1874–1875 as a way to address essentially Western issues such as government land policy, land fraud, restriction on fencing, and the control of cattle thieves. A dispute over the issue of political involvement in the Greenback Party resulted in its demise, but the idea had spread to other areas, including Parker County where farmers reorganized the Alliance in 1879 to promote self-help strategies such as cooperatives, boycotts, land reform, and other locally based mass action. The growth of the Alliance was painfully slow in the early years. In 1880, the Alliance had twelve local organizations (later called suballiances) in three contiguous counties in North Central, Texas. By 1882, there were only 120 suballiances in twelve Texas counties. By 1886, however, the state meeting of the Texas Alliance reported 104 Texas counties organized. Eventually, in the late 1880s, after it spread throughout the Southwest, Great Plains, and Midwest, the organization would claim a membership of over one million members.

The Crop Lien System and Rural Poverty

Most historians have attributed the popularity of the Alliance to a rational Southern response to adverse economic conditions among cotton and tobacco farmers. These adverse conditions included a chronic lack of capital and credit in the postbellum South, the emergence of the crop lien system, and the dependence on cotton production in defiance of dropping prices. The crop lien system, which affected both tenants and some landowners, pushed Southern farmers deeper into debt. Local merchants and plantation owners furnished farmers with the necessary supplies for the year for making a crop, taking collateral in the form of a lien on the future crop. Seldom, however, did the sale of the crop pay off the debt incurred to the local merchants or landowners. Because of the crop lien system and low prices, farmers sank deeper and deeper into indebtedness. A report in 1889 showed that 75 percent of the farms in Arkansas were on the verge of insolvency, and another report revealed 70 percent of farmers in the hill counties of Louisiana faced insolvency.

A dissenting voice to the economic cause theory of the rise of the Farmers' Alliance comes from Richard Hofstadter in his influential book *The Age of Reform: From Bryan to FDR* (1976). Hofstadter attributes the farmers' protest movement to status anxiety with the rise of powerful, wealthy, and intellectually sophisticated urban elites and the modernization of industry and commerce with the declining importance of the farm population.

Rural Rebellion

Whatever the exact motivation for farmers to join in protest, the Alliance took a rather circuitous route to national prominence. In the early 1880s, these local county groups combined in Texas to form a statewide organization that enabled the movement to enter new areas of economic cooperation beyond the local level, to mobilize a larger number of members, and to prepare for further expansion. In 1884 at the state convention, W.L. Garvin, president of the Alliance, appointed S.O. Daws to full-time salaried "Alliance Lecturer" to tour Texas to increase membership, a decision that paid rich returns in the next couple of years. His speeches on the need for cooperative efforts to overcome the effects of monopoly struck a responsive chord among many farmers in Texas. At the same

time, the state leadership promoted cooperative economic strategies such as joint stock cooperative stores, cottonseed oil mills, and corn mills, as well as cooperative cotton gins. Suballiances set up trade agreements with local merchants to provide the lowest possible prices in return for the guarantee of Alliance members' trade on a cash basis. These efforts to establish financial independence meant vigorous opposition from local merchants, retailers, and manufacturers. Furthermore, the poorest farmers, enmeshed in the crop lien system, were unable to take advantage of the cash-only trade agreements.

The state convention of 1886 in Cleburne marked yet another key turning point in the history of the Texas Alliance. With the local-based activities of co-ops and trade agreements having reached a point of diminishing returns, the stage was set for a new approach to solving the plight of farmers through new cooperative efforts and political activism. The delegates approved a list of political demands of which the most radical were an overhaul of the monetary system to increase the amount of money in circulation and a demand for government regulation of the railroads. However, a group of economic self-help advocates that included the president, treasurer, and others bolted and called a rival convention to denounce what they thought was too partisan a political approach of the Cleburne meeting.

Those who insisted on avoiding partisan politics feared that this might result in the organization of a third party that would ultimately destroy the one-party system in the South. Rather quickly, Charles William Macune, who took over leadership of the Alliance when the economic self-help group left, worked out a compromise based on three proposals: unification of the local cooperatives into a state exchange, spread of the Alliance to the surrounding states, and the development of a national organization. Macune's "State Exchange" idea appeased those who wished to stay with economic strategies and yet caught the attention of farmers trapped in the crop lien system and those suffering from the low prices of cotton. The Exchange (funded by two assessments on each member) was to act as the agent for supplying the farmers with necessities and to function as a marketing agent for the sale of the farmer's cotton after it had been harvested.

This exchange would reduce the cost of supplies by negotiating directly with manufacturers, thus eliminating the local merchants and the middleman; on the other end of the farmer's economy, bulk marketing of crops would increase the prices farmers got for their crops. The idea spread to other Southern states, with exchanges organized in Georgia and Florida. After a year, the Texas Exchange went bankrupt, in part, for the lack of capital, while the other exchanges, after some initial successes, also failed because of a starvation of money and inexperienced management. The second initiative of the 1886 convention was to take the organization to a new regional level. A plan to send some 350 lecturers throughout the South to organize new local suballiance chapters and state organization became the ultimate logical step to increase the size of the alliance. Implicit in this move to transform the group from a state or regional institution to a national movement was that the problems of the farmer could be addressed at the national level more effectively than at local or state levels.

At the same time as the Alliance experienced a phenomenal increase, Macune recognized the value of consolidating with like-minded groups throughout the South and Great Plains and with labor unions, including the Knights of Labor. In 1887, the Texas Farmers' Alliance merged with a similar group in Louisiana; in 1888, the National Farmers' Alliance merged with the Agricultural Wheel. By 1890, the Alliance, with its name changed to the National Farmers' Alliance and Industrial Union, claimed membership and suballiances in thirty-three states.

The Alliance Expands

During the period of rapid expansion of membership, the Alliance recruited diverse and, often, conflicting classes of farmers: tenants, yeoman farmers, and large plantation owners. The interests of the large landowners often worked against those of the poorer farmers, an inherent conflict that weakened the overall efforts to institute meaningful change. The Alliance also took hesitant steps to join forces with African Americans in the South by supporting the creation of the Colored Farmers' National Alliance. The Colored Farmers' Alliance was organized in Houston County, Texas, in late 1886. By 1891, the black organizers had chartered groups in every Southern state except Arkansas and had organizations outside the South. Farmers, both black and white, realized that they too shared common economic interests and goals, and tentative cooperative strategies were worked out at the national meetings in Ocala, Florida, in 1889. However the two alliances remained separate. Although historians praise the efforts, they conclude that the white Alliance's overall attitude represented paternalism rather than a sincere attempt toward racial equality.

A similar source of ambiguity arose with the in-

clusion of women in the movement. Unlike the Grange, which insisted that women participate in membership and provided a separate and complementary organization, the Alliance encouraged female membership without clearly defining their role and extent of involvement in activities. In many local chapters and state alliance organizations, women faced no obstacles to joining, but a few local suballiances showed less willingness to accept female members;, some even prohibited them from joining. Those women who belonged to the Alliance joined because they believed in the goals and objectives of the group, not to create changes for the role of women in society. By 1890, women constituted 11 percent of the total membership of the Alliance.

Social Movement and Third-Party Politics

Responding to pressure from below, the Alliance inevitably moved closer to political activism, first at the state level by putting pressure on the Democratic Party and then in states where a two-party system existed, on the Republican Party to incorporate their reforms. On the state level, they experienced some success and then turned to the national level with new schemes to relieve the economic difficulties of farmers. These proposals took the form of monetary reform to bolster the amount of money in circulation to relieve debt and push up the price of agricultural commodities. The subtreasury idea, hailed by some historians as a noble approach, called for the abolition of the national bank system for the deposit of federal money and the establishment of government warehouses by the U.S. Treasury Department to store the crops. The treasury would loan farmers 80 percent of the market value at the local prices of the stored crops at a very low interest rate. This solved the problem of cash-strapped farmers being forced by debt to sell crops immediately after harvesting when prices tended to be traditionally low, and at the same time increased the amount of money in circulation. The Alliance also demanded increases in the coining of silver, which was another way of putting more money into circulation. Like the Exchange, the subtreasury offered farmers a way to end their dependence on the crop lien as a source of credit and held out the promise of control of their commodity market.

In 1890, after failing to induce the Democratic Party to support their subtreasury idea, after being unable to generate cooperative support from the Democrats for Alliance demands, and after initial success in endorsing candidates for state office, the Alliance leaders decided the time was auspicious for the third-party movement. The members and leadership went en masse to the new political party, along with the political platform and ideology of the Alliance. With the creation of the Populist Party, the demise of the Alliance came quickly. The Alliance did not hold national conventions after 1890, and the suballiances and state organizations soon followed in closing out their activities. The death of the Populist Party at the national level came as a result of their 1896 endorsement of the Democratic presidential candidate William Jennings Bryan.

Historians of the movement have debated the extent to which the farmers' movement challenged the existing status quo. Some hold that the movement had a backward looking approach to reform by emphasizing the Jeffersonian myth of the small, independent, landowning farmer. Nevertheless, the demands for government regulation of railroads, monopolies, and the subtreasury plan represented a radical alternative to the capitalist industrial economy. At least several historians argue that moral reforms were equally important as the economic and political objectives of the farmers. Among those concerns expressed in the Alliance newspapers and demands issued at state and national meetings were the regulation of the sale of alcohol, the need for renewal of piety, prohibition of Sunday labor, and control of pornographic material.

Economic Depression and Rural Crisis

Whether radical or conservative, in the final analysis, the self-help economics programs failed to improve the permanent condition of farmers, even though Alliance efforts were more sweeping than those of the Grange. The rate of tenancy, indebtedness, and insolvency jumped in the late 1880s and early 1890s, in part as a result of the economic depression that swept the country in the early 1890s. On the other hand, benefits from the political reforms called for by the Alliance resulted in more far-reaching changes for farmers and American citizens. Alliance and Populist political demands included the regulation of railroads, the regulation or destruction of monopolies and trusts, the institution of more democratic election laws, and various social reforms, most of which were implemented under the Progressives.

Conclusion

Perhaps the enduring lesson that farmers learned from the Alliance was that a mix of self-help, lobby-

ing, and political pressure on the two major parties worked best in the long run. The third-party venture that killed both the Farmers' Alliance and Populist Party proved a dead end.

The later successes of the National Farmers Union (formally called the Farmers Educational and Cooperative Union of America) best illustrate this point. This third mass-farmers' organization in American history was established near Point, Texas, in 1902. The movement initially experienced phenomenal growth with a membership of 120,000 in 1910 and over 140,000 in 1919, mostly in the Gulf States but eventually spreading to the Midwest and Far West. Following in the footsteps of the Grange and the Alliance, the union promotes cooperative warehouses, grain elevators, stores, and grain and corn mills, establishes plants for manufacture of farm products, and advocates diversification in the production of agricultural commodities, good farm-to-market roads, and improved farm management techniques. These essentially economic and social reforms have been balanced with effective lobbying of the two political parties for programs and public policies to benefit farmers.

Greenbacker Movement
1870s–1880s

Greenbackers proposed the government issuance of paper money in order to break the private banks' monopoly over the money supply. This approach was the broadest and most popular manifestation of antimonopolist sentiment, which was central to the politics of the post–Civil War period. Greenbackers built the largest unsuccessful third-party movement in American history, representing a complex movement in terms of its origins, scale, and legacy.

Roots of Greenbackism

Greenbackism originated in three currents. First, only a generation before, discontented voters had built the most successful third-party movement in the American experience, bringing the Republicans to power. Older policy had created a tight money supply largely controlled by banks, but the Lincoln administration met its unprecedented expenses by having the government print "greenbacks." This move created an inflation that fueled wartime prosperity and minimized the seasonal indebtedness of farmers and rural people. Some Civil War Republicans had also advocated black civil rights, a shorter working day, and woman suffrage. Such topics faded, however, with the presidency of Ulysses S. Grant, notable for its corruption and its plans to restore the gold standard. Midwestern farmers, as well as many abolitionists, saw their party as having sold itself to business interests and contemplated a repeat of their earlier third-party movement.

The second current important to originating the Greenbacker Movement flowed from the Democrats. "New Departure" Democrats understood that dwelling on their constitutional hostility to the excesses of wartime and Reconstruction Unionism would gain them nothing against Republican efforts to depict Democrats as disloyal. Their approach was new in that they favored reforms like the Granger laws, but most importantly because they avoided "dwelling on their constitutional hostility to the excesses of wartime and Reconstruction Unionism."

Thus far, the Democrats had established a "Solid South" at the price of holding a permanent minority status elsewhere in the country. Those urging a "New Departure" tapped the older antimonopolist rhetoric of Andrew Jackson to criticize the Republican fostering of industrial and commercial privileges.

Third, Greenbackism had clearly radical origins. Before the Civil War, Cincinnati stovemaker Josiah Warren had formulated his version of anticapitalist communitarianism by establishing cooperative stores based upon "Labor Notes" that offered to exchange labor on an equitable basis. He also founded the community of "Modern Times," where he worked with Edward Kellogg who urged adopting paper money as a means to blunt the excesses of antebellum capitalism. Another antebellum writer, William B. Greene, urged cooperative banking as an alternative. For such thinkers, money had ceased to represent wealth and had now become a means of controlling economic life, as well as something of an allegory for representative politics.

The 1872 Elections

Such ideas captured the growing movement of trade unionists and labor reformers who began pressing on the legislative agenda such matters as industrial working conditions and a shorter workday. By 1868, adherents of the postwar National Labor Union formed state Labor Reform parties in Massachusetts and New Hampshire and, in 1871, launched a National Labor Reform Party (NLRP). It faced a presidential election in 1872, even as the Republican Party split between the "Liberal" critics of Grant and the regulars, largely leaving Democrats to bloc with the Liberals.

In this context, the prospect of power politics seduced the NLRP convention at Columbus on February 21–22, 1872. It adopted a lackluster platform that embraced "the Ohio idea" of limited paper money advocated by that state's Democrats, and it nominated an Illinois Democrat, David Davis, who after the convention predictably declined the nomination in order to avoid losing his strength with his Democratic Party comrades. The Democrats nominated the Liberal Republican, Horace Greeley. Those that did not want to support Greeley held their own convention and nominated Charles O'Conner on what they called a "Straight-Out Democratic" ticket, which the NLRP leaders endorsed.

The more radical insurgents subsequently convened on May 9–11, in New York's Apollo Hall where they launched the Equal Rights Party. It nominated "the Women's, Negroes, and Workingmen's ticket," Victoria Woodhull and Frederick Douglass. A flattered but loyally Republican Douglass declined, while Woodhull faced arrest over alleged libels in her paper. Woodhull was always facing arrest over libels in her newspaper, *Woodhull and Clafflin's Weekly,* most famously in the Beecher-Tilton scandal.

Midwestern Third-Party Movements

The "hard times" that swept the Midwest with the Panic of 1873 politicized mass organizations like the Patrons of Husbandry, "the Grange." When the elected Supreme Court of Illinois declared unconstitutional the state's efforts to regulate its railroads, angry farmers built a Peoples' Antimonopolist Party that defeated the combined efforts of the more well-heeled parties to reelect the justices. So, too, a similar Independent Party emerged in Indiana. By 1874, there appeared Missouri's Peoples' Party, Michigan's National Reformers, Nebraska's Independents, and the Antimonopolists of Iowa and Minnesota, in addition to the Independent Reformers of Kansas and Wisconsin.

With the exception of Missouri, these parties emerged in states with Republican majorities. Since they posed the clearest possibilities for Democratic victories in these states, adherents of that party, along with "fusionists" within the third party eager to broker power, pressed continually for a shared agenda. For genuine insurgents, a stable third party required a national movement, which seemed to require a unifying issue like the Kansas-Nebraska Act of twenty years before. The government's decision to replace wartime "Greenbacks" with a "resumption" of metal specie and "the gold standard" supplied the unifying issue.

Currency and the National Third Party

On June 10, 1874, coordinated state conventions in Illinois and Indiana adopted the call to save paper money. When the Democratic conventions did not address the issue, a small but important conference met on November 25 at Indianapolis. It united the new rural insurgents with former NLRP groups from Illinois, New York, Ohio, Connecticut, Pennsylvania, and West Virginia. Some NLRP leaders favorable to a broader platform met at Harrisburg on March 3, 1875, but failed to win much support.

The new party called itself the "Independent Party" or the "National Party" to distinguish itself from the state parties in Illinois and Indiana and the sectionalized Republican and Democratic parties. Nevertheless, the press called their creation the "Greenback Party," and most insurgents readily accepted the name.

The 1876 Cooper-Cary Campaign

A presidential nominating convention gathered on May 17–18, 1876, at the Academy of Music in Indianapolis. As with the earlier NLRP, larger delegations nominated "favorite sons," mostly prominent "New Departure" Democrats, Ohioans pressing for former Ohio governor William Allen and many Illinoisans still wanting to name David Davis, who had beached the NLRP four years before. Eager to get beyond the impasse and to reach potential voters in the Eastern cities, the convention turned to the "Greenback Democrats" of New York City, who had briefly stopped at the convention while seeking allies for the upcoming Democratic National Convention.

Oddly, a party of mostly rural Midwesterners predisposed to vote Republican nominated an octogenarian urban Jacksonian, Peter Cooper, and Democratic Senator Newton Booth of California. When Booth declined, he was replaced with Samuel F. Cary, the popular Cincinnati Democrat. The Greenback Party ultimately won nearly 82,000 votes in the presidential election of 1876, about 1 percent of the turnout. In the end, the Greenback ticket represented little more of a serious third-party effort than had the earlier NLRP slate.

More generally, American politics faced a crisis in the "Stolen Election" of 1876. Several Southern states filed conflicting returns. The Democrats and Republicans each turned in different vote counts in three states, on which the election would turn. Setting aside the question of which returns were valid, the Federal authorities established a national Electoral Commission to decide who would be the president. Ultimately, this solution allowed Republican Rutherford B. Hayes to become president if he abandoned any further federal Reconstruction of the South.

Labor Politics

In the wake of the NLRP, advocates of a more independent and radical strategy had continued on to socialism. The ethnic self-fragmentation of the International Workingmen's Association had continued into 1874 when various suspended sections combined with a Newark labor party to launch the Social Democratic Workingmen's Party of North America, which in 1876 led to the Workingmen's Party of the United States.

By then, broader numbers of workers had turned to political action. In 1877, after several years of worsening economic conditions, the railroads announced yet another round of pay cuts in July. Driven to desperation, railroad workers walked off the job, detonating a national "general strike" that led to the seizure of cities by strike committees at Toledo and St. Louis. Often over the objection of local officials, the national authorities sent troops against the strikers; this was in sharp contrast to their unwillingness to protect the rights of the Southern freedmen. The national authorities used U.S. troops against striking workers, even as they withdrew the last of those troops in the South to sustain the Reconstruction project.

In the wake of the strikes, working-class organizations proliferated. The Knights of Labor began growing rapidly, subsuming preexisting unions and organizations. At the polls, they began electing Socialist and labor candidates in numerous communities. In places, they became Greenbackers or formed a natural alliance with the earlier insurgents.

The Greenback-Labor Party

Insurgents met again in a drafty schoolhouse on Washington's birthday during the bitterly cold winter of 1878. Embracing their new composition, strategy, and orientation, the rebuilt coalition called itself the Greenback-Labor Party (GLP). A coalition of "Greenback" and "Labor" organizations, this represented a rebuilding of the groups that had attempted the National Labor Reform Party in 1872, but on a vastly greater scale. Notably, an important coalition of clubs chose to keep their Union Greenback organization independent of the GLP. So did the Socialists who reorganized as the Socialistic Labor Party (SLP) that winter. One faction of the Workingmen's Party of California, which blamed the oppression of labor on the presence of the Chinese, was interested in the national movement, but much of its leadership was drawn inexorably toward the Democratic Party. So, too, the triumph and hegemony of the white "Redeemer" Democratic governments in the South inspired a series of independent splits from the Democrats, including such statewide formations as the Readjusters' Party, which sought to renegotiate the payment of Virginia's indebtedness. Freethinkers, hostile to a rising tide of militant Protestantism, had also launched a National Liberal Party.

Nevertheless, in places the GLP subsumed the social and community functions of groups like the Grange. It also gained some localized strength beyond the Midwest, winning elections in places as diverse as northern Alabama or the more isolated parts of northern New England. If a successful national movement required such successes, the strategy of fusion seemed to offer a shortcut. Fusion involved making joint nominations with the weaker of the two major parties, a process that generally allied Southern Greenbackers with Republicans and Northern Greenbackers with Democrats.

The 1878 Peak

The off-year national elections saw the largest third-party movement in twenty years and proportionately the largest in U.S. history. Although the insurgents claimed 1 million votes for their congressional candidates that year, accurate numbers reveal a more complex reality. Between 802,000 and 852,000, ballots went to the exclusively Independent, National, Greenback, or Independent Greenback tickets, with another 25,000 divided roughly equally between Prohibitionists and Socialists. In addition, third-party candidates running either with Democratic endorsements or, at least, no Democratic opposition, added another 303,400, while another 217,000 went to insurgents with apparent Republican support. Independent Democrats running against Democratic candidates won another 150,000, and Independent Republicans, by the same criteria, gained over 18,000. Such addi-

tions nearly doubled the purely insurgent vote to a total of about 1,600,000.

This deluge of independent ballots elected twenty-two independent congressmen, most of whom had some ties to the third party. The Midwestern heartland of the movement elected several new representatives, including: Adlai E. Stevenson and Albert Palaska Forsythe of Illinois; Rev. Gilbert De La Matyr of Indiana; and James B. Weaver and Edward Hooker Gillette of Iowa. In addition, voters in the Northeast elected the following to Congress: Hendrick B. Wright, William D. Kelley, and Seth H. Yocum of Pennsylvania; Hezekiah B. Smith of New Jersey; Daniel O'Reilly of New York; Bradley Barlow of Vermont; and George W. Ladd and Thompson Murch of Maine. More surprisingly, the GLP also cracked the solid Democratic South before it had even hardened: Nicholas Ford of Missouri; Daniel L. Russell of North Carolina; William M. Lowe of Alabama; and George W. Jones of Texas. (Other victorious independents included Henry Persons, William H. Felton, and former Confederate Vice President Alexander Hamilton Stephens in Georgia, and Noble A. Hull, who won a Florida district with no party affiliation.)

The 1880 Election

On January 8, 1880, sixteen of these independently elected congressmen invited "all classes of people, of men and of women, too, who . . . are willing to act with us" to join in planning united action in the upcoming presidential election. The June national convention at Chicago's Exposition Hall moderately expanded the GLP platform and adopted the SLP's plank: "We declare that land, air, and water are the grand gifts of nature to all mankind, and the law or custom of society that allows any person to monopolize more of these gifts of nature than he has a right to, we earnestly condemn and demand shall be abolished."

The GLP nominated for president Representative Weaver, who shared the ticket with the elderly Texan Barzillai J. Chambers. Weaver spoke of Greenbackism as opposition to the idea not only of a monopoly over the money supply, but of land and the means of transportation as well. Weaver also stumped the country and directly confronted the nationally untenable nature of fusion. State parties like that in Maine hoped to continue winning victories through an alliance with the Democrats, which would doom the party in Alabama. Making a direct issue of genuine independence (and the Democratic denial of black civil rights in the South), Weaver found himself marginalized, then misreported, and finally rendered invisible in the national press, even as many state leaders tore the national party to pieces. In the end, fusion in Maine, for example, reclassified the 65,310 ballots cast for mostly GLP electors into officially Democratic votes, and reporting of the official insurgent totals as merely 306,867, a considerable decline from the total of two years before.

Legacy

The GLP survived, particularly at the edges of the large insurgency, in places like Kansas. However, in the wake of the election, the National Antimonopoly League declared itself a National Antimonopoly Party, which stole a march on the remnants of the Greenbackers in 1883 and 1884. This left the GLP simply to endorse Benjamin F. Butler, the Antimonopolist candidate, who openly did the inverse of Weaver by actively courting funding from factions of both major political parties. Again in 1887 and 1888, a nominally insurgent Union Labor Party acted before the Greenbackers and got their endorsement.

Perhaps the real legacy of the Greenbackers was their role in becoming the proponents of a People's Party (the Populists) after 1890. The Populists ran an older but energetic Weaver for president in 1892, and found itself succumbing to the same problems with regard to fusion.

Populist Movement 1890s

Populism is the common name for an agrarian democratic political movement of the 1890s, formally identified with the People's Party of America. The Populist movement attracted veterans of earlier reform movements, including Greenbackers, Prohibitionists, union organizers, and dissident Republicans and Democrats. But the party's most significant forerunner was the Farmers' Alliance, which initiated an agrarian revolt in the 1880s. The Alliance attempted to influence the two major political parties, but by 1891, when the national parties had failed to champion the reforms advocated by the Alliance, many within the movement argued for the creation of a party that reflected their interests.

Organization

From 1889 to 1891, efforts were made to unite farmer and labor organizations into a single political lobby. In December 1889, sectional Alliance organizations met in St. Louis to discuss the development of a national political strategy to resolve the struggle between organized capital, corporations, and organized labor, unions, and farmer alliances. In June 1890, Alliance members in Kansas formed the statewide People's Party and challenged the dominance of the Republican Party in that state. Six months later, representatives of the Southern Farmers' Alliance, the Farmers' Mutual Benefit Association, and the Colored Farmers' Alliance met in Ocala, Florida, where they compiled a list of demands that resembled the interests debated in St. Louis. These interests included cheap currency, the abolition of national banks, and the adoption of a subtreasury plan. The subtreasury plan held the most interest for farmers.

Developed by Texan Charles Macune, the subtreasury plan called for the federal government to build and operate warehouses, which could hold nonperishable crops that enabled farmers to obtain government loans of up to 80 percent of their crop values at 1 percent interest. Leaders at the meeting advised their members to support candidates of either major party who would pledge themselves to the list of demands drawn up in Ocala.

The failure of the two major political parties to enact the demands of the Alliance organizations led to the call for a national meeting by Leonidas Lafayette Polk of North Carolina. President of the Southern Farmers' Alliance since 1889, Polk argued that the only viable alternative for his members was the formation of a third political party. In May 1891, more than 1,400 delegates from thirty-two states met at Cincinnati. Resolutions to create a new political party to represent farmers' interests passed easily. Formally organized in February 1892 at St. Louis, the People's Party of the United States of America held its first national convention at Omaha in July 1892. Many of the most ardent advocates for labor and farmer rights attended the meeting, including Tom Watson of Georgia, who argued that "you must organize, agitate and educate." The new party attempted to educate the public through the publication of 150 newspapers and by using experienced lecturers from the Alliance movement who traveled to forty-three states reaching over 2 million farmers. Members expected Polk to be the party's nominee for the presidency, but he became ill following his return from St. Louis and died in North Carolina in June, one month before the party selected its standard-bearer.

The Party

The Populists, as the new party quickly became nicknamed, nominated James B. Weaver of Iowa, a former Union general and Greenback presidential candidate, as president. Joining him on the ticket for vice president was James G. Field of Virginia, who had served the Confederacy during the Civil War. The sectional flavor of the ticket was a deliberate attempt to overcome the animosity that lingered from the war and to

undercut the Republican political strategy of "waving the bloody shirt," calling attention to the sacrifices of the Civil War to promote their political agenda. The new party wanted to focus voter attention on contemporary economic and political issues and not relive the Civil War.

The new party's platform made this position very clear. Written by Ignatius Donnelly of Minnesota, the platform consisted of twelve short paragraphs that included quotations from the U.S. Constitution and a call for immediate action to save the nation from a "vast conspiracy against mankind." He reminded the delegates that "we meet in the midst of a nation brought to the verge of moral, political and material ruin." Since the two political parties no longer represented the interests of the people but the interests of profit, Donnelly called upon the new party to restore democracy to the nation.

Following Donnelly's preamble, the party's platform listed the specific measures to be taken in order to achieve the restoration of democracy by focusing upon finance, transportation, and political reform. Among the list of demands was a national currency, to be issued by the federal government without the use of banking corporations, government ownership of all transportation and communication lines, a graduated income tax, the establishment of a postal savings system, direct election of U.S. senators, the adoption of the secret ballot, the initiative and referendum, restrictions on immigration and immigrant ownership of land, and an eight-hour working day for industrial labor.

Political Development and Reaction

Although Weaver was defeated in the 1892 presidential election, the new party received over a million votes (8.2 percent of the popular vote) and demonstrated considerable strength in Texas, Georgia, North Carolina, Nebraska, and the Dakotas. The party won the governors' races in Kansas and Colorado. Most affected by Populist support were Southern Democrats who became alarmed by the People's Party's attempt to recruit black farmers to their cause. Democratic leaders in the one-party region could not afford a division of the Southern white vote between Democrats and Populists, for that would allow the black vote to determine the balance of power in the old Confederacy. By the mid-1890s, Southern Democrats took action to disenfranchise the black community. The use of such measures as the "Grandfather clause" (if your grandfather could not vote neither could you, thereby disenfranchising descendants of slaves), literacy tests, and the poll tax resulted in dramatically decreased black participation in the electoral process in the South. In Louisiana, for example, the number of black voters decreased from a historic high of 130,000 in 1896 to just over 5,000 four years later. Alabama saw its black participation drop from 121,159 to 3,742 during that same four-year period.

Southern Democrats had reason to be alarmed. Shortly after the 1892 election, the Philadelphia and Reading Railroad collapsed, initiating a Wall Street panic and resulting in the worst depression the nation had suffered since the end of the Civil War. By 1894, millions were out of work, 500 banks closed their doors, 16,000 business firms collapsed, 750,000 workers went out on strike, and demands that the federal government take action climaxed with a march on Washington. The Army of the Commonwealth of Christ, led by Jacob Coxey, a former wealthy businessman turned Populist who organized Coxey's Army of the unemployed and poor, arrived in the nation's capital to demand that the government respond to the needs of the people. Although Coxey and some of his followers were arrested shortly after they arrived, the march suggested the level of frustration that citizens felt and the desperate measures they were willing to take. Both major political parties realized that the upcoming mid-term elections could not be reduced to re-fighting the Civil War.

In 1894, the People's Party received 1.5 million votes in the congressional elections, sending to Washington six Populist senators and seven Populist representatives. But party leaders had hoped for better results and were disappointed by the strength of the Republicans. Democrats, however, saw more defections from their party and felt pressured to respond to the demands of the Populists, especially those in Southern states. As a result, many Democrats began to publicly endorse much of the platform of the People's Party. Their actions initiated a national debate over silver.

As a result of a drain on the gold reserve of the country, President Grover Cleveland asked for and received from Congress the repeal of the Sherman Silver Purchasing Act. The gold reserve of the country continued to decline, however, and the president negotiated with private corporate leaders, most notably J.P. Morgan, to purchase gold in exchange for federal bonds. Many in the country saw the deal as evidence of the predominance of private business interests over the interests of the people. As the depression worsened, silver advocates argued for a return to a bimetallic currency. Publications such as William H.

Harvey's *Coin's Financial School* (1894) and Ignatius Donnelly's *The American People's Money* (1895) became required reading for Populists and Democrats. The Republican Party remained loyal to the gold standard.

The Election of 1896

As the election of 1896 approached, the Populists debated whether to concentrate on the silver issue at the expense of their other interests. Pro-silver Populists argued that the People's Party should hold their nominating convention after the two major parties met in order to attract "silverites" who might abandon their parties following their own conventions. But pro-silver Democrats captured their convention and nominated William Jennings Bryan. The young former congressman from Nebraska galvanized the convention with his "Cross of Gold" speech. Bryan's speech, which endorsed silver and much of the People's Party platform of 1892, presented a problem for silver Populists who held their convention two weeks later in St. Louis. Suddenly, the Democrats provided an opportunity to secure the goals of those who favored a return to silver. Led by the national chair of the party, Herman E. Taubeneck, pro-silver Populists advocated dropping the Omaha platform and building a coalition with the Democratic Party on the issue of free coinage of silver. Ignoring a minority in the party who argued that fusion with the Democrats would result in the death of the Populists, the new party endorsed Bryan as their presidential candidate. To soothe those who feared that the party might lose their identity, the People's Party nominated one of their own, Tom Watson, as Bryan's running mate.

Silver, however, was not the sole issue in the election of 1896. As in 1860, the differences between the two candidates were sectional and economic, but they were also social and cultural. Bryan cast himself as a crusading prophet who would reform not only his party but the country as well. The Republican candidate, William McKinley of Ohio, followed the direction of his party boss, Mark Hanna, who recognized the need to create a coalition of business and labor in the urban Northeast, thus presenting a campaign that would not offend the rising Protestant middle class, Catholic immigrants, or the economic elite of Wall Street. Thus, the campaign conducted by Bryan and McKinley pitted the promise of moral reform against the promise of the melting pot. The Republicans assured those who had aspirations of economic and social mobility that their platform offered more opportunity. This strategy and changing demographics resulted in a Republican victory. McKinley carried the industrial Northeast, which had increased its population over the previous twenty years, thus increasing its electoral count. Bryan won in the South and the West, but the population of those regions produced fewer electoral votes. Just over 7 million people chose McKinley, resulting in 271 electoral votes, while 6.5 million people cast their ballots for Bryan, producing 176 electoral votes.

Decline and Legacy

Those who feared that fusion with the Democratic Party would destroy the People's Party proved correct. By the end of the campaign, many state Populists had lost control of their organizations to Democrats, especially in the South. The economy recovered in 1897, as discoveries of gold in South Africa and Alaska inflated the currency. The following year, the country went to war against Spain. A wave of patriotism swept the country, and Americans showed little patience with critics of the nation. As Tom Watson put it, "the blare of the bugle drowned the voice of the reformer." Economic prosperity, patriotism, and political fusion explain the rapid decline of the Populist movement. The party would remain an organized entity for three more elections. In 1900, the fusion Populists once again endorsed Bryan, with the results the same as four years earlier. In 1904 and 1908, the party turned to Tom Watson.

Watson's political career suggested an inherent problem faced by Southern Populists. Western Populists risked little more than political failure in challenging those who held political power. Southern Populists, on the other hand, not only challenged the economic and political relationships of their region but the racial relationship as well. As a result of their attack on the political establishment of the old Confederacy, Southern reformers risked not just their political security but also their personal security. By the early 1900s, the race-baiting tactics of New South politicians created an atmosphere that resulted in the monthly lynching of black citizens and segregation as a way of life, convincing many reformers, including Watson, that making overtures to the black community would be a political liability. As a result, Watson and others convinced themselves that a biracial political partnership was the source of the failure of the People's Party. Watson ended his political career by using the same race-baiting techniques as the New South leaders that he opposed in the previous decade.

The Populist movement proved to be successful in the long run, however. The party's critique of the modern corporate industrial state created the political

Following his "Cross of Gold" speech at the 1896 Democratic National Convention, presidential candidate William Jennings Bryan tries to ride three parties to victory. His loss to Republican William McKinley spelled the doom of the Populist Party. *(Brown Brothers)*

agenda for the country for the next thirty years and proved to be the forerunner of the reform movements of the twentieth century—Progressivism, the New Deal, and the Great Society. Much of the Omaha platform of 1892 became a reality, including the direct election of senators, the initiative and recall measures, a personal income tax, a Warehouse Act that allowed farmers to store produce as collateral for short-term loans, and a Federal Farm Loan Board.

The words "populism" and "populist" took on new meanings in the last four decades of the twentieth century. After World War II, populism migrated

from the political left to the political right as public figures began to refer to themselves as populist to distance themselves from those entrenched in Washington, D.C. Individuals such as Senator Joe McCarthy (R-WI) in the 1950s, Governor George Wallace in the 1960s, and Reform Party candidate Ross Perot in 1992 presented themselves not as advocates for economic and social change, but as defenders of the status quo. In reality, figures like McCarthy, Wallace, and Perot had little in common with the Populists of the 1890s and were, instead, self-proclaimed crusaders who thrust themselves into the role of savior. In contrast, Populist leaders of the 1890s were members of the class they sought to represent, and they challenged the economic and political assumptions of those in power.

Agrarian Socialist Movement
1890s–1920

The Birth of Southwestern Socialism

Early twentieth-century agrarian socialism was an extension of and yet fundamentally different from the Populist movement. Agrarian socialism would be centered in the Great Plains and Southwest, with its most active leaders and voters in Oklahoma and Texas. The first voices to call for dissident Populists to make the break to socialism, indeed, came from Oklahoma and Texas. Radicals in northern Oklahoma formed a local Socialist Party in 1895 and briefly flirted with the Socialist Labor Party (SLP). They soon discovered, however, that the SLP had no interest in farmers. Dominated by its founder, the orthodox Marxist Daniel De Leon, this group made little effort at electoral politics and concentrated instead on enforcing doctrinal purity within a rank-and-file of mostly Northeastern, immigrant industrial workers. Socialist thought and organization also flickered to life here and there among laborites and intellectuals, either in Marxian ideology or in uniquely American hybrids such as the Knights of Labor.

Most of the early Socialist impetus among agrarians came during and after their failed struggle against fusion with the Democratic Party in 1896. Their disagreement with conservative, pro-Bryan elements of the party forced the dissidents to consider their alternatives. Disgusted with fusion, ex-Populist William Farmer of rural north Texas soon founded the first Texas Socialist Party. Of even greater import to the Great Plains and Southwest, in 1895 ex-Populist editor Julius A. Wayland moved *The Appeal to Reason* to Girard, Kansas, specifically to preach socialism to farmers. Wayland's *Appeal to Reason* and its message of socialism would reach tens of thousands of rural readers every week well into the second decade of the twentieth century.

Near the same time that Farmer was announcing his party in rural Texas, former American Railway Union (ARU) president Eugene V. Debs announced the formation of a similar loosely knit group in the Midwest. Debs's railroad union had been crushed by its defeat in the Pullman strike of 1894, but in 1898 Debs began to reassemble the fragments of the ARU as the Social Democracy of America. Debs toured the country organizing party locals and found a number of ex-ARU members now homesteading in Oklahoma. Together with Farmer's Texans, Debs gathered them into the somewhat utopian Social Democracy.

In 1901, however, Debs's Social Democracy joined New York dissidents bolting the SLP in a coalition with Midwestern Socialists led by Victor Berger to form the Socialist Party of America (SPA). Meeting in 1902, Farmer and other Texas Socialists formally joined their state party with the new Socialist Party of America. Thus, from the most radical Populists and through Debs's Social Democracy, the new Socialist Party of America gained a coterie of militant Southwestern agrarians. Consequently, this new coalition became the vehicle of protest in the last widespread agrarian political revolt in United States history. It would be nearly a decade, however, before it became a significant rural movement.

Slow Growth in the Countryside

The Socialist Party of America would grow slowly during its first decade of existence among rural Americans. It grew slowly because of contradictions between rural values and the SPA's central message of collectivization. That it grew at all among rural people testified to increasing levels of dismay among farmers. The rapid triumph of turn-of-the-century nationwide capitalism displaced culturally entrenched structures. Although country people's values and expectations regarding economic behavior sprang from their old culture, their new societal reality was a nationwide marketplace impervious to face-to-face relationships or moral codes.

In the Southwest, angry middle-aged farmers found it increasingly difficult to acquire ownership of land. Considered a normal but temporary step up the "agricultural ladder," sharecropping and tenancy had become the permanent occupation for the majority of southwestern farmers by 1910. Most tenants and sharecroppers continued to hope that they would someday work themselves into ownership of their own land. Others, more embittered, began to consider alternatives.

The Socialists' critique of the new marketplace—if not necessarily their proposed solutions—resonated with the rural poor majority's belief that all behaviors, including economic behavior, should conform to locally defined moral standards. At the same time, belief in the individual ownership of land remained a nonnegotiable cornerstone within their culture. Furthermore, the values within rural culture that found the most resonance in the Socialists' message of radical economic equality tended to grow from the plain folk's religious beliefs. Yet, one of the most oft-repeated and effective criticisms of socialism was that it emanated from an atheistic scientific materialism. In the Southwest, at least, by 1910, local Socialists had taken action to minimize the aspects of socialism that were most objectionable to rural people, while emphasizing those aspects with which they would most agree. Culturally, this meant an energetic emphasis on "Bible socialism" through a heavy reliance on rural preachers as lecturers, organizers, and candidates. In the case of land ownership, this meant changing the party's platform to protect the property rights of family farmers.

Eugene Debs carried the Socialist banner in five of the first six presidential elections of the twentieth century. At the Socialists' highwater mark in 1912, Debs's best state percentages came from the West where sparse urban middle-class populations gave the militant unionized workers' votes relative clout. Historians ascribe Debs's 1912 double-digit percentages in the Mountain and Pacific states to the militant Western Federation of Miners and other radical industrial workers in the six-year-old Industrial Workers of the World (IWW). Debs also scored tens of thousands of votes in the industrialized Midwestern and Northeastern states among organized workers, especially old railroaders. Historians also have been fascinated with the Socialists' short-lived burst of support among rural voters in Oklahoma, Arkansas, Louisiana and Texas. Yet, until Oklahoma and Texas Socialists changed their party's land policy in 1910–1912, the SPA made few gains among these former radical Populists. Only Texas and Oklahoma have had precinct-level analysis of SPA support in the early 1900s, and most of the scholarly exploration has focused on Oklahoma where Debs won 16.4 percent of the vote in the presidential election of 1912. The most comprehensive of these studies, historian James R. Green's *Grass-Roots Socialism: Radical Movements in the Southwest, 1895–1943* (1978), includes Arkansas, Louisiana, Oklahoma, and Texas.

At the 1908 SPA national convention, agrarians and pragmatists tried to soften the party's stance on land collectivization. Agrarians at the convention sought to reassure farmers that socialism did not require the seizure of land from the farmer "which he himself occupies and tills." These moderates argued that small landowning farmers were indeed not members of the capitalist class, as doctrinaire Marxists insisted, but were fellow workers. Ironically, Southwestern delegates led the fight against a land compromise and made some of the most rigidly collectivist speeches offered at the convention. Texan Jake Rhodes cast the land question as a contest between landlords and tenants. As a former organizer for the Farmers' Union—a movement taken over by landlords in Oklahoma, Texas, and elsewhere—he warned of the dire consequences of landlord influence. Those who bemoaned calls for land collectivization did not really farm, Rhodes claimed, but, instead, were those "who farms the farmer." Rhodes argued that if railroads should not be exempted from public ownership in order to woo the votes of railroad stockholders, then land should not be treated any differently. Texan Laura B. Payne and Oklahoman Stanley Clark took similar vocal stands at the 1908 SPA convention and helped to persuade the delegates to reject the agrarians' land compromise.

Zenith of the Agrarian Period: Oklahoma Leads the Way

Before it could prosper in Oklahoma, the Socialist Party had to "get right" with "Jefferson and Jesus." In *Agrarian Socialism in America: Marx, Jefferson and Jesus in the Oklahoma Countryside, 1904–1920* (1999), historian Jim Bissett shows that the party had to democratize and embrace the property rights of small farmers (Jefferson) and adopt the morality of the rural, Protestant, evangelical church (Jesus) before it could effectively appeal to rural people. The orthodox Marxists who had founded the party in Oklahoma proved unequal to this task and gave way to

an indigenous radicalism led by ex-Farmers' Union veterans. First, these local agrarians successfully fought to democratize and decentralize their party. Having accomplished that by 1910, they sought their next goal—winning over the rural poor majority—with a two-pronged strategy. On the one hand, Oklahoma Socialists attacked the excesses of monopolistic early twentieth-century American capitalism in a Bible-based critique, while, on the other they revised their Socialist creed to protect the property rights of small farmers who worked their own land.

The Rev. J.T. Cumbie, a small farmer and ordained Baptist minister, typified this effort with nominations for governor and for congressman. Furthermore, in a critical move to expand their appeal, Oklahoma Socialists promised the redistribution of government-controlled land to the growing class of sharecroppers and tenant farmers. Inspired in part by the Homestead Act, the Oklahomans promised future government renters the right of permanent occupancy—if not ownership—of the land that they worked. The Oklahoma Socialist rank-and-file had taught their state leadership a crucial lesson that migrated to other state platforms, most notably Texas.

The Agrarian Plank in Texas

Texans showed little interest in rural radicalism—SPA style, at least—before adjustments similar to Oklahoma's were introduced. Battles between the orthodox Marxists and the democratic agrarians colored Texas' early Socialist experience. While party zealots sorted out their differences, rural Texans stayed away from the party on Election Day. In 1908, Jake Rhodes received only 1.6 percent of the total vote for governor. By 1910, however, the agrarians were in the ascendancy and had adopted a compromise land plank in the platform assuring farmers that Socialists did not seek total collectivization of land. In a move very similar to Oklahoma's, the Texas party promised to respect the property rights of farmers who themselves had "use and occupancy" of their land and who did not exploit another's labor.

The 1910 Texas platform contained eighteen separate provisions. The first of these called for increased democracy through the initiative, referendum, recall, female suffrage, abolition of the poll tax, and "the unrestricted right of peaceable assembly, free speech, and free press." The platform also promised relief to industrial labor through the adoption of labor's traditional wages, hours, child labor, workplace safety, and insurance demands. The Socialists promised "humane and scientific" treatment of prisoners and the insane, a system of socialized healthcare, free public school textbooks, maintenance of "destitute children," and the extension of political asylum to oppressed peoples.

The platform also prominently featured the new land policy. The Socialists called for an end to sales of public lands and the reclamation of all leased land after the current leases expired. The platform demanded that all lands sold for taxes should be bought by the state and added to the public domain, and that foreign landowners should appraise their own holdings for taxation purposes, with the state having the right to purchase such holdings at the appraised value plus 10 percent. Any land held for "exploitation and speculation" (i.e., land farmed by tenants or hired labor or unoccupied land owned by individual speculators or corporations) would be subject to an annual "graduated" land tax roughly equal to a year's rental income, thus forcing the landlord to sell on reasonable terms to tenants or forfeit ownership to the government. Tenants could apply for ownership of farms and pay a normal rent-share to the state until one-half the land's market value had been met. At that time, the tenants would stop making payments and would be issued "a permanent right of occupancy." Furthermore, the Socialists promised that their election would mean tax exemption for the "tools, teams, and implements of landless farmers" up to $800. The platform also called for public ownership of gins and other agricultural processing facilities that were "in their nature public."

The Paradox of Agrarian Socialism

Of course, herein lay the paradox of agrarian socialism. Of all those who have written on the subject, historian Jim Bissett most closely captures the internal tension of the movement. Bissett finds that agrarian Socialists sought a "marriage of Jefferson and Marx." Steeped in Southern yeoman culture, Oklahoma agrarian Socialists' first choice would have been widespread ownership of the land among working farmers. As changing societal and economic structures impinged upon their ability to achieve their first goal, a significant minority proved willing to use Marxian analysis and ideology to achieve widespread "use and occupancy" of the land for the benefit of the rural majority. But this substitute for outright ownership proved too bitter a pill for most of Oklahoma's rural voters to swallow.

The Agrarian Socialist Press and Camp Meetings

More than through any other medium, agrarian socialism spread throughout Texas and Oklahoma through Socialist "camp meetings" and through the writings of radical newspaper publishers. The Socialist camp meetings were drawn directly from the Populists before them who got the idea from rural outdoor religious revivals. Sometime in the summer, usually in July after the crops had been "laid by," the plain folk would often gather to sing, preach, and pray together in great "protracted meetings" with the worshippers, of necessity, camping on the meeting grounds. The Populists had recruited preachers from plain folk religious traditions—Baptist, Methodist, and various Holiness sects—who first politicized the rural camp meeting in the 1890s. By the 1910s, Southwestern Socialists had perfected such gatherings throughout Oklahoma and Texas. The largest such gathering in East Texas boasted an attendance of 50,000 during a week's worth of preaching, singing, and propagandizing. For those not religiously or politically inclined, the East Texas Socialists promised a hamburger stand, a Socialist rodeo, and a Ferris wheel.

Perhaps of even greater importance in spreading the message were rural Socialist newspapers. It would be difficult to exaggerate their number, which must have been over three dozen in the Southwest; only a few, however, had significant readership and influence. Kansan Julius Wayland's *Appeal to Reason* claimed a circulation greater than the *Saturday Evening Post* nationwide with over 70,000 subscribers in Oklahoma and Texas alone. Oklahoma also produced more than its share of influential Socialist newspapers, including Oscar Ameringer's *Oklahoma Pioneer* and Pat Nagle's *Tenant Farmer*. The Socialist press in Texas likewise thrived for about a decade. Former East Texas farmer Joshua Hicks published the *Farmer's Journal.* A primitive Christian, Socialist, and pacifist, Hicks also argued that believers should take a stand against racism and poverty. The successor publication to the *Farmer's Journal* was publisher E.O. Meitzen's and editor Thomas A. Hickey's *The Rebel*. Begun in 1911, *The Rebel* would eventually claim a circulation of over 30,000 before wartime repression shut it down in 1917. From its inception, *The Rebel* concentrated almost exclusively on the task of appealing to rural readers, especially tenant farmers and small farm owners.

The Renters' Unions

Socialists in the Southwest attempted to organize the rural working class. As rates of tenancy shot upward, Socialists reached out to landless farmers who now made up the majority of all farmers. Oklahoma Socialists organized a Renters' Union in 1909; that group called for militant, class-conscious cooperation among sharecroppers and tenant farmers. *The Rebel*'s Tom Hickey organized a Texas Renters' Union in 1911 with calls for a "confiscatory tax" on absentee landlords. The Texas union at first excluded blacks, but, according to James Green, union organizer Hickey saw the error of his ways after witnessing black-white solidarity among East Texas IWW timber workers in 1912. Whatever real chances such organizations had were weakened by relatively low membership totals and the inexorable rise of land ownership concentrations among the most highly capitalized farmers and landlords. These organizations either died out completely during World War I (1914–1918) or existed in name only and in the imaginations of the remaining faithful. Yet, such memorable embers died hard; some would be fanned back into ignition in the form of the Southern Tenant Farmers Union during the Great Depression of the 1930s.

Support in Arkansas, Louisiana, Oklahoma, and Texas

Socialist voting in the Southwest peaked in 1912–1914. The largest rates of SPA voting occurred in the poorest agricultural counties in Arkansas, Louisiana, Oklahoma, and Texas. In Texas, Socialist votes also tended to come from former Populist and agrarian protest strongholds. Lavaca County Judge E.O. Meitzen exemplified this tendency with his sojourn from Greenbacker, Allianceman, and Populist to, finally, Socialist. Socialists did not manage to win any statewide elections anywhere in the country in 1912. One congressman, Victor Berger, was elected from Wisconsin. And in 1912 and 1914, voters across the Southwest elected a number of Socialist local officials such as a justice of the peace, a constable, and a county judge in Texas to a mayor in Arkansas. In 1914, Oklahoma elected six state legislators, five representatives, and a state senator.

The 1912 presidential vote gives some idea of the effect of the agrarian compromise within the Southwestern SPA, at least on the state level. Arkansas gave 6.5 percent of its presidential vote to Debs, up from 3.8 percent in 1908. Louisiana reported a 6.6-percent Socialist vote, exactly double the 1908 showing. Oklahomans voted for Debs at the rate of 16.4 percent, over 40,000 votes. This almost doubled the Socialists' 1908 finish in Oklahoma. In Texas, Debs received 8.3

percent statewide, a 207-percent increase over 1908. Analysis of rural versus town precincts shows that in one typical county where the Socialist vote mirrored the statewide SPA share of 8 percent, rural dwellers voting Socialist at almost the same rate as Oklahomans at 15.7 percent.

Reddin Andrews, Texas' SPA gubernatorial candidate in 1912, finished with slightly more votes than Debs with a little over 25,000. Andrews exemplified all of the elements the Socialists sought to bring together in the Southwest. Backed by a suitably agrarian platform, Andrews also packed plenty of appeal for rural Texans. A Baptist minister, the candidate had pastored country churches throughout central and East Texas and had served briefly as president of the state's largest Baptist college, Baylor University. His status as a Confederate veteran, his gray beard and Stetson hat, only served to further strengthen his cultural credentials with rural voters. Andrews did almost as well in 1914; thereafter, the Texas Socialist vote declined precipitously as it did in Oklahoma, Arkansas, and Louisiana.

Why did few Southwestern rural voters support J.T. Cumbie and Reddin Andrews at the height of the movement? First, the Socialist Party stood against absolute property rights and for a fundamental restructuring of the economy. No amount of maneuvering could obscure that issue or change the fact that belief in property rights lay at the heart of rural culture. Second, tradition favored the Southern Democrats who represented themselves as the party of the Lost Cause, the Confederacy. The Civil War still defined partisan loyalty for many voters, North and South. And, finally, the Socialists were not to be trusted with protecting white supremacy.

Race and Southern Socialism

Of all the charges their critics might level, for Socialists in the South the most devastating was the charge of sympathy to the cause of African-American equality. Because of the region's recently passed disenfranchisement laws (poll taxes, etc.), Socialists were facing a seriously truncated electorate. For example, Texas' 1902 poll tax eliminated much more than the 12 percent of Texans who were black; it effectively cut the Texas voting lists in half. Consequently, those among the rural poor majority most likely to be attracted to the SPA were no longer members of the polity. As a result, agrarian Socialists in Texas faced an electorate of only the economic top half of the population and one that was virtually all white as well. Furthermore, many agrarian Socialists came from a staunchly white-supremacist culture and adhered to such views themselves. Herein lay another killing contradiction for agrarian Socialists. The clearly elucidated antiracist ideals of international socialism—and the declarations against racism by such SPA leaders as Debs—were about to run afoul of the intractability of culture. This hurt the Socialists' chances of winning elections in two ways. Obviously, lukewarm stands for racial equality would win few of the remaining handful of black votes. Even more critical, the suspicion of even scant sympathy for racial equality guaranteed the loss of many, perhaps most, of the Socialists' potential white support in the countryside.

The Oklahoma Socialist Party came closest to upholding Socialist ideals concerning race. In his excellent study of southwestern radicals, Green shows that the Oklahoma SPA wholeheartedly defended voting rights for African Americans. Others in the region tended to avoid the topic when they could and finesse their party's position when they could not.

Patriotism, Repression, and Decline

The outbreak of World War I (1914–1918) forced a momentous crisis within the ranks of international socialism. Purists urged the national parties to reject their countries' war efforts. They argued that the working class had no vested interest in the outcome of a battle between imperialist, capitalist regimes. Yet, in most cases, European Socialists compromised their ideals in the name of pragmatism or patriotism and more or less heartily supported their individual nations. Only the SPA stuck to its ideals and remained staunchly antiwar throughout, thereby committing political suicide. The SPA's symbolic spokesman, Debs, eventually would be convicted under the wartime Sedition Act and sent to federal prison for speaking against the war. Opening themselves and the party to charges of cowardice, disloyalty, and even treason, Socialists never recovered from their failure to support the American war effort. U.S. Postmaster General Albert S. Burleson, a Texas cotton landlord, energetically used his special wartime mandate to shut down the Socialist press. Arrested and questioned in connection to a crackdown on draft resistance in the Southwest, Tom Hickey was soon released but saw his newspaper effectively repressed by Burleson's denial of the use of the mails. The last issue of *The Rebel* came out in June 1917.

The death of the Socialist Party of America in the Southwest did not mean the end of agrarian discontent. It did, however, mean the end of the last significant agrarian electoral protest in that region. A few

rural protesters elsewhere carried on through the Nonpartisan League of the Dakotas in the 1920s and in the Farmer-Labor Party in 1930s–1940s Minnesota. Perhaps the closest successor to Southwestern socialism came with the 1930s-era Southern Tenant Farmers Union, founded in Arkansas by agrarian veterans of the Socialist Party of America.

NONPARTISAN LEAGUE 1915–1920s

The Nonpartisan League (NPL) was a rural political organization active in thirteen states between 1915 and the 1920s. Feeding on the discontent of exploited farmers, the League operated through the political primaries of the old parties in a nonpartisan spirit. It enjoyed great success for a time, especially in North Dakota, where sweeping reforms ameliorated conditions for small producers. Founded and initially run by Socialists, the Nonpartisan League made state intervention in the market economy widely acceptable and thus laid the foundation for modern Midwest liberalism.

RURAL POVERTY

Ever since the late 1800s, North Dakota farmers should have been making good money growing wheat. While their product was high quality, many did not own their own land and nearly all of them had high debts—and conditions only grew worse with time. Grain brokers and railroads headquartered in Minnesota controlled the market (and North Dakota's political elite), leaving the state weak economically. Without terminal markets in their home state, farmers had no choice but to sell their grain through the Minneapolis Chamber of Commerce (a grain exchange) and the Duluth Board of Trade.

Once their grain went to market, farmers lost all control over the product; middle men and processors docked them at every turn. Wheat was not weighed fairly. Brokers often sold it to each other several times, taking a commission every time. They graded the wheat low and then regraded it upward once sold, thus taking a little more out of farmers' pockets. Railroads charged exorbitant fees, as did local banks in North Dakota, two thirds of which charged usurious (more than 10 percent) rates. The Granger movement of the 1880s and the Populist uprising of the 1890s had little impact on late-developing North Dakota, although some historians have argued that Populism was a vital social precursor of the NPL.

FARMER ACTIVISM

By 1915, North Dakota stood ready for change. Arthur C. Townley wanted farmers to form a nonpartisan organization to bring about reform. A former school teacher, plasterer, and small farmer, Townley and his brother started growing flax in 1907 and expanded to 8,000 acres before losing everything when frost destroyed most of their crop and speculators caused prices for the rest to plummet. Farmers like Townley became attracted to the Socialist Party (SP) and a platform that included immediate demands for rural credit, state-owned mills and grain elevators, state insurance on crops, and help to the unemployed. Several Socialists had been elected to local offices, but the program became more popular than the party. So the SP tried an experiment designed to reach out to non-Socialists drawn to the immediate demands. Townley and others toured the state with party-owned Ford automobiles filled with literature and talked farmers into voting for Socialist candidates who supported the platform without pushing party membership on them. The drive was a success but was stopped by the North Dakota SP in early 1915, much to Townley's disgust.

NONPARTISAN FARMERS LEAGUE

Historians disagree about what happened next. In his seminal work on the League, *Political Prairie Fire: The Nonpartisan League, 1915–1922* (1985), Robert Morlan asserts that Townley came up with the idea of creating a nonpartisan league for farmers after a conference with Socialist leader Albert E. Bowen. More recent scholarship asserts that Bowen himself should be given credit for the League scheme. In any event, Townley and Fred B. Wood of the American Society of Equity went on to found the Nonpartisan League,

with the ambitious goal of capturing all three branches of state government by putting up League candidates in both Republican and Democrat primary elections, a recent Progressive reform designed to make the old parties more democratic. The League platform said that the state should own the elevators, mills, and storage facilities, inspect the grain and how it was moved, provide tax breaks for farm improvements, insurance against hail damage, and nonprofit rural credit banks.

Townley recruited organizers, training them in what he understood to be proper psychology. Recruiters bought Fords on installment from the League and followed systematic routes throughout the state. Farmers paid dues in the form of checks postdated to October, after their harvests. At first, most all of the League organizers and leaders were men who had been Socialists, but unlike the SP, which tended to view farmers as small-time capitalists, the NPL blamed all the farmers' problems on big business. Townley understood that the League needed its own press to keep the movement together, so by September 1915 the *Nonpartisan Leader* was up and running, with leading Socialist journalist Charles Edward Russell recruited to write. The paper provided news directly to members, offered guidance, and countered anti-League propaganda. Most all North Dakota newspapers denounced the NPL, which made little difference to members forearmed with the *Leader*'s version of the truth. League opponents refused to recognize farmers' problems and thus had no solutions of their own. Farmers felt a burning sense of loyalty to a cause reinforced by literature, songs, and art that set down roots in their culture.

Electoral Politics

The NPL prepared to take over the state government in 1916 by holding a series of election rallies. Lynn Frazier, university graduate, small farmer, and rock-ribbed Republican, emerged as the League's candidate for governor. Most NPL candidates ran in the Republican primary, although some stood for nomination in the Democrat contests. Frazier overwhelmed all opponents in the spring primary and kept his momentum up through the summer at a series of all-day picnics for farmers. In September, the NPL took control of the Republican State Central Committee, writing a platform that reflected the League agenda. The Democratic State Central Committee's platform proved to be remarkably similar.

Faced with a political juggernaut, conservative opponents of the League focused on keeping the NPL out of the state Supreme Court, but League men prevailed anyway. Frazier won the fall race in a landslide, while NPL candidates won 62 percent of the seats in the state House. However, the League failed to capture the state Senate.

Wasting little time, Governor Frazier asked the new legislature to pass the entire NPL agenda, as well as reduce the legal limit on interest rates, set a minimum wage for women and children, create a labor bureau and a system of nonpartisan primaries and elections, start civil service reform, and come up with a lot more money for rural education. The NPL schooled new legislators in public speaking and parliamentary procedures. Members lived together in the same hotel, with their leaders controlling political caucuses from the top down. The League agenda was rolled up into House Bill 44, a new state constitution; it passed the lower house easily but failed in the Senate. In the end, the legislature passed many laws, including state grain grading, farm tax breaks, state woman suffrage, a nine-hour day for women, banking reform, regulation of railroads, and better financing for rural schools. The Senate refused to pass a nonpartisan election scheme, workers' compensation, a slashing of railroad freight rates, and a minimum wage for women.

World War I

In the spring of 1917, a hysterical patriotism spawned by American entry into World War I derided everything German. Still, millions of people were unsure about the great departure from traditional American isolationism, especially in the rural Midwest. Many NPL members opposed the war as did most Socialists. In the end, the League generally supported the war but wanted to pay for it by taxing the rich. Like the Progressives, the League favored expanded government control over food, prices, railroads, utilities, and energy. Superpatriotism proved to be a rallying point for conservatives who hated the NPL.

North Dakota attracted attention from all over the country from conservatives, Socialists, and Progressive reformers alike. Responding to inquiries, NPL organizers went to Montana, Washington, Kansas, and Wisconsin. The Land League of Texas dispatched Ernest R. Meitzen to North Dakota in the spring of 1917, and he became a convert to the NPL. Meitzen's partner in the popular Socialist weekly, *The Rebel*, Thomas A. Hickey, worked for the League too, but in the end, Southwestern tenant farmers and sharecroppers were too poor and had little in common with grain farmers far to the North. The NPL leadership thought all

Certificate of Membership
in
The National Nonpartisan League

This Certifies that John Larson
of North Dakota is a member in good standing in The National Nonpartisan League and is entitled to participate in Conventions and other gatherings of the League with full privileges as such member

The National Nonpartisan League
Date of joining June 16, 1917
This certificate good to December 1st-1918.
1481
A. C. Townley
NATIONAL PRESIDENT

Founded by Socialists in 1915, the Nonpartisan League drew thousands of adherents in thirteen states, primarily in North Dakota and the Midwest. The group favored many Populist and Progressive reforms, including increased government aid and protection for farmers, state regulation of railroads, a minimum wage, and workers' compensation. *(State Historical Society of North Dakota A5623)*

along that it would be easy to capture South Dakota, although farmers there did not share the same sense of political urgency. Self-styled "Theodore Roosevelt Republican" South Dakota governor Peter Norbeck proved to be a formidable opponent, co-opting the League with Progressive-style reforms, including rural credits, workers' compensation, and state marketing.

The League also targeted Minnesota where farmers faced problems similar to those in North Dakota. Beginning in the fall of 1916, a small army of Fords (the only car at the time) and recruiters began crisscrossing the Gopher State. A rival group of reactionaries formed the Minnesota Nonpartisan League to sow confusion among farmers, but the effort flopped. A more dangerous adversary arose in the Minnesota Public Safety Commission, a committee consisting of the governor Joseph A. Burnquist, the attorney general, and five cronies given unlimited power to persecute those perceived as disloyal to the war. The commission branched out county by county and created its own Bureau of Intelligence, modeled after the new federal agency headed by young J. Edgar Hoover. Needless to say, the conservative commission, financed in part by the Minneapolis Chamber of Commerce, saw the NPL as disloyal.

Opposition to Nonpartisan League

Violent attacks on the NPL led to a series of resolutions to clarify the League's position. It supported American intervention and free speech, but opposed war for the purpose of annexation of territory and denounced indemnities and secret diplomacy. NPL speakers invoked the name of President Woodrow Wilson whenever possible to further blunt charges of disloyalty. Townley was attacked verbally because he denounced war profiteers in angry terms. The NPL accepted the Food Administration's setting low prices for wheat out of patriotism. Still, the League faced criticism even in North Dakota, where newspapers accused it of being behind the appearance of Kate Richards O'Hare, an outspoken antiwar Socialist sentenced to five years in prison for making a speech in Bowman.

Townley toured in the East to educate Americans about his organization. He and President Wilson both spoke to an American Federation of Labor Convention in Buffalo. Townley also lectured at Cooper Union in New York City and received good press no-

tices. He stopped in Washington, D.C., for private meetings with Wilson, George Creel of the Committee on Public Information, and Food Administration czar Herbert Hoover.

In Minnesota, opposition to the NPL organized swiftly, with the loyalty issue proving to be a handy club. The governor gave sheriffs a blank check to break up meetings so that they could not become riots. In a subsequent reign of terror, organizers and speakers received severe beatings followed by tar and feathers. Farmers who dared to attend NPL meetings were pelted with eggs, stones, and yellow paint. By the spring of 1918, the Minnesota Public Safety Commission had shut the League out of many counties. Townley appealed to George Creel, who regarded the League as a significant voice of farmers, and so supplied loyalty speakers under NPL auspices. League spokesmen attacked the commission for supporting war for democracy while denying free speech to its own citizens. Eventually, Townley and Joe Gilbert, League organization manager, were indicted in Minnesota for sedition. After the war, the U.S. Supreme Court upheld Minnesota's sedition law with an eloquent dissent from Justice Louis Brandeis that would serve as a basis for an eventual reversal.

Nonpartisan League in North Dakota

It was a different story in North Dakota, where little blood was shed because the NPL controlled the government. The League remained active in Montana during the war with only a few incidents of violence. In South Dakota, Governor Norbeck ordered no interference with League activities, but he looked the other way when local vigilantes broke up meetings. Self-appointed secret police hassled NPL organizers in Iowa, while Washington and Texas saw much violence. In April 1918, east Texas vigilantes whipped three organizers, doused them with salt water, and shot at them as they fled for their lives. The terror subsided after the spring primary election season in most states. The Nonpartisan League did not use violence against its enemies, and members were not actively disloyal. On the contrary, they bought liberty bonds and grew lots of grain for the war effort.

Undaunted, the North Dakota NPL drew up new plans to achieve what had been proposed the year before in House Bill 44. Again, the spring election campaign revolved around the Republican primary, where loyalty did not prove to be an issue. With Townley at the height of his popularity, the League enjoyed a great victory, emerging in control of all three branches. Few realized it at the time, but in losing, conservative Stephen Joseph Doyle had put together a coalition that would eventually put an end to League dominance.

In Minnesota, the League backed popular Congressman Charles A. Lindbergh, Sr. for governor. (Lindbergh's son, Charles A. Lindbergh, Jr., would later become famous as the first aviator to fly from New York to Paris.) The ambitious platform resembled North Dakota's with its plan for state-run enterprises in meatpacking, dairy, and wood products. Lindbergh supported the war once the United States took the plunge, but he had been vehemently opposed to entry. Conservatives amassed a huge war chest (paid for by Public Safety Commission) to beat the man who was a hero in some areas of the state and a villain in others. At several stops, vigilantes bombarded Lindbergh with garbage and even shot at him. The incumbent defeated Lindbergh by 50,000 votes. Elsewhere the League made little headway, owing to the strategy of concentrating on North Dakota and Minnesota because most of the other eleven states had some Progressive laws on the books already and farmers needed more education on what needed to be done next.

The fall elections brought few surprises, with the NPL triumphing in North Dakota and losing in Minnesota and South Dakota. In Idaho, the League elected several members as state legislators, while Colorado, Nebraska, and Montana also sent some members to their state houses. The new national NPL was held together at the center by the National Executive Committee, with Townley having the deciding say. All dues (minus commissions to organizers) went directly to the committee, which passed funds out to the states.

At last, in early 1919, the North Dakota League could implement its full economic agenda: a comprehensive nonprofit state-ownership system for farmers, paid for by state credit, and authority to run the system through a powerful new board. The caucus still made decisions behind closed doors, with Townley's opinions carefully considered. Even at the height of the postwar Red Scare, the NPL legislators refused to consider passing laws criminalizing syndicalism (aimed at the Industrial Workers of the World) or making it a crime to fly a red flag.

Opponents tried to smear the League with accusations of sexual immorality because women were encouraged to play an active role outside of their homes. In 1919, the NPL created a Women's Auxiliary that gave an opportunity for improved networking among rural women. The League supported full suffrage and,

once in power, ratified the Nineteenth Amendment to the Constitution, which granted women the right to vote nationally. The NPL devoted significant space to women's issues in its publications as well. In 1922, Minnie D. Craig became one of two women elected to the North Dakota state legislature, where she worked on banking reform. She would eventually rise to a position of leadership as speaker of the state house.

The most important law under consideration would create an Industrial Commission to oversee cooperative state organizations. As proposed, the commission would be made up of the governor, the attorney general, and the secretary of agriculture and labor, responsible for every state agency except schools, prisons, and charitable organizations. A new Bank of North Dakota, keystone to the entire scheme, would loan money to farmers, regulate other banks, and finance state agencies. Virtually every bill passed by more than two-thirds in both houses, which meant that they would come into effect immediately after the adjournment of the legislature. The NPL legislative agenda was complete, with every platform plank having been turned into law. Yet in several of the other twelve states where the NPL operated, conservative forces successfully countered the League by banning direct primaries.

Shortly after its legislative triumph, schisms developed in the North Dakota NPL. Three leaders, Attorney General William Langer, Secretary of State Tom Hall, and State Auditor Carl Kosizky, began to attack the League in bitter terms to prepare the ground for a takeover. Conservative opposition coalesced around the Independent Voters Association (IVA), which attacked the NPL as Socialist. The League proved to be vulnerable after all. While the Bank of North Dakota began its business quickly, other parts of the scheme would take some time to construct. During the Red Scare, many violent acts were perpetrated against the NPL. Ensconced in power, League leaders sometimes overreacted to criticism, as when they created an investigating committee with broad powers to acquire information on any person or group attempting to bring about harm to others, especially the NPL.

In 1920, the NPL renominated Frazier to run in the primary. Opponent William Langer was tough because as a former insider he could claim the League had lost its way due to corruption. Frazier won easily, but voters also passed an anti-Red flag law, an ominous sign that the tide was turning against the League. In the nationwide Republican landslide that fall, the North Dakota NPL won again but took a beating in all other states. Governor Frazier saw no need for new reforms as some existing programs, especially the Bank of North Dakota, came in for criticism. Several investigations in the state legislature proved critical of the administration. The next year, the IVA led a drive to recall NPL-elected officials even as a full-fledged fight for control of the organization in North Dakota weakened the insurgency further. Townley stayed on the sidelines, as did many members preoccupied with a farm recession. The voters recalled Frazier and two other high officials.

With the IVA in charge of the government, conservatives discovered that the Bank of North Dakota had some virtues after all. The NPL decentralized, shifting more of the dues and real power to state organizations in 1921. Townley finally served his ninety days in jail for his wartime conviction and then resigned as president. In 1922, Lynn Frazier was elected to the U.S. Senate, while the NPL lost control over both Houses in North Dakota. Conservatives lost a U.S. Senate race in Minnesota, not to the NPL but the Farmer-Labor Party. Clearly, the League was on its way out, folding the *Leader* in the summer of 1923. The national office closed its doors two years later. The League lived on as a major force in the North Dakota GOP for a few more years. William Langer bought his way back into the NPL and made it his personal power base for twenty years. He served two scandal-ridden terms as governor before moving on to the U.S. Senate. In the 1950s, the NPL merged with the Democratic Party in North Dakota, where it has continued to work on behalf of farm interests.

Conclusion

The NPL was never as radical as its conservative opponents wished to believe. If anything, it provided a more moderate alternative to the Socialist Party and the Industrial Workers of the World. Farmers and former Socialists created the League as part of a struggle between small capitalists and bigger ones—in other words, people who farmed for profit and the capitalist bankers, railroads, and grain brokers who made money off of the land indirectly. Using modern sales techniques and making effective use of print media, the League entered state government through the old political parties in primary elections. In North Dakota, where the NPL takeover of government was complete for a short time, the League expanded state government to reform the system of marketing so that farmers could make higher profits and live more stable lives. The League is perhaps best seen as a rural variation of Progressivism, which

was also nonpartisan, reformist, and effective in alleviating some of the grosser abuses of the capitalist system.

Women's Home Demonstration Movement

1920s–1930

The Home Demonstration movement was a confluence of the domestic economy movement and the scientific farming movement in the early Progressive Era (1890–1910). Reformers became alarmed by the attrition rate of American farmers, whom they saw as the Jeffersonian core of U.S. society. They believed that by improving rural living conditions, they could turn back the growing tide of urbanization. Agricultural extension education was a means of showing rural Americans better ways to farm and to live, with an eye toward middle-class values. Spurred by the boll weevil invasion throughout the South—an infestation that destroyed cotton crops—individual states began sponsoring agricultural extension agents to work with male farmers. Some states recognized the significant impact that food, shelter, and clothing had on the lives of rural people, and they engaged home demonstrators to improve women's homemaking skills. Schools of agriculture, established under the Morrill Act (1862 in the North; extended to the South in 1890), embraced extension work as one of their primary functions.

At farmers' institutes across the nation, expert agronomists showed farmers how to create larger yields, and domestic science professionals began lecturing to farm women. The U.S. Department of Agriculture established a national extension service in 1907. The Smith-Lever Act of 1914 further institutionalized the extension service, appropriating $10,000 annually to each school of agriculture and stipulating that a portion of the money go for home demonstration. Local counties supplemented federal and state payments for salaries and supplies. Recognizing the value of home demonstration work, organizations such as urban women's clubs lobbied vigorously for adequate funding for women's work.

Women's Crucial Work

Although agricultural reformers acknowledged the importance of farm women's work, they strongly believed in the separation of men's and women's work. In the reformers' conception of farm life, men raised the crops while women took care of all domestic duties. Accordingly, the Smith-Lever Act divided men's and women's programs with little recognition of the symbiotic nature of the farm family. Extension work was also completely segregated by race, with separate programs for whites and blacks. In some Southern states, African-American programs began shortly after white ones. But in other areas, such as Durham County, North Carolina, work by and with African Americans did not begin until the 1930s. African-American programs were uniformly underfunded and, consequently, understaffed.

Women's Programs

Reflecting the pressing need in the rural South where most extension work began, women's programs at first emphasized the most basic aspects of life: food, shelter, and clothing. With increasing knowledge about nutrition, home demonstration agents sought to improve farm families' diets. They often began by working with girls, encouraging them to plant small garden plots of tomatoes and to can the results for home consumption. The young charges, sometimes organized into "corn clubs" and "canning clubs," competed on the size and quality of their yields. For farm women, activities such as planting year-round vegetable gardens, canning vegetables and meats, and drying fruits extended the time when home-grown food would be available.

Canning was particularly important, and women enthusiastically embraced the hot work of preserving produce over wood stoves. In many communities, the home demonstration agents sponsored community canning centers, with up-to-date equipment, receiving a portion of the canned goods as payment for the use of the equipment. In 1924, for example, black Texas women canned more than 224,000 quarts of fruit and vegetables and more than 46,000 quarts of meat and fish. Aspiring cooks also learned improved techniques for such difficult procedures as bread making. Agents

introduced an array of goods to make cooking more convenient. One homemade appliance was an early-day slow cooker, known as a fireless cooker. Often, agents stressed the purchase of goods, bringing farm women into the world of consumption. National emergencies, such as World War I, also provided fodder for agents, as they taught about the use of wheat, sugar, and meat substitutes.

Supplementing Income

In the South and Southwest, where lack of income was particularly acute, farm women learned to develop home industries, manufacturing goods that could be produced and sold to bring cash into the family economy. They sought to improve chickens, eggs, and butter, the petty commodities most typically sold by farm women. Farm women also learned to make crafts such as baskets and rugs. The home demonstration agents sought to improve marketing for all of these products.

Home improvements were also a significant part of home demonstration work. Some of the issues were basic matters of public health, such as installing window screens, building sanitary privies, and constructing home water systems. Needs for food and shelter united in an emphasis on more efficient kitchens. Clubs sponsored competitions such as "better kitchen contests" for women who made improvements on limited budgets. Farm women learned to make mattresses for their families. For more prosperous clients

whose basic needs had been met, home demonstration agents stressed aesthetic and decorative elements such as making curtains and rugs and reupholstering furniture. Others emphasized yard beautification with transplanted plants.

Farm women also received instructions on clothing. Agents believed that the farm women would fare better socially and economically in dealing with city-dwellers if they looked less "country." Thus, agents taught sewing techniques, including ways to make over old garments, which often emphasized style and appearance.

Demonstration Clubs

For some farm women, home demonstration clubs had profound impacts on their lives. In some areas, however, home demonstration clubs had limited effectiveness. In the South, clubs were strictly separated by race, and significantly fewer services were offered to African Americans than to white women. Locations with concentrations of recent European immigrants sometimes rejected the efforts of the government workers, preferring to keep their knowledge within the circle of their kin. And class often divided farm women. Poorer women lacked the cooking utensils, stoves, sewing necessities, and garden implements needed to carry out the programs of work, and they lacked the time to attend meetings. In many instances, the work failed to reach the people who could have benefited from it most.

With the coming of the New Deal and World War II, rural areas of the nation lost population, and membership in home demonstration clubs peaked. No more than a quarter of farm women belonged to home demonstration clubs, but for their members, their impact could be profound. The women whose husbands owned land and adapted to business-oriented agriculture after World War II continued to enjoy sessions on canning, cooking, and sewing throughout the 1950s. Like many agricultural reforms, however, home demonstration's goal of a decent farm home for all farm families was accomplished not by the agency itself but by the departure from farming of those people who had most needed the assistance.

Southern Tenant Farmers' Union

For a few years during the Great Depression, African-American and white tenant farmers in the Arkansas Delta's cotton country fought for relief from their economic misery through the vehicle of a potentially radical biracial organization called the Southern Tenant Farmers' Union. Tenants were galvanized into action after the federal government's New Deal Agricultural Adjustment Act provided for paying cotton planters to reduce crop production and the planters (the landlords) systematically denied tenants their share of the payments. Historians agree that the Southern Tenant Farmers' Union (STFU) was a reaction to the operation of the Agricultural Adjustment Act (AAA), but they differ about the meaning of and ideological commitment of the movement the STFU tried to become. Almost all agree that the basic goal of the STFU was to secure tenants' portions of AAA benefits paid to planters as part of the Act's crop-reduction program. Other analysts see the STFU as going further and attempting to lead agricultural laborers in the economic and political overthrow of the planter class. For their part, Delta cotton planters chose—through mass tenant evictions—to sever the relationships through which they had traditionally maintained their social and economic power. When they evicted tenants to reap the benefits of the AAA, they sacrificed the economic leverage so critical to their control. Thus, when former tenants began to join the STFU, planters could not rely on traditional modes of economic coercion to defeat the organization. Instead, they relied solely on methods that brought national attention to the plight of the union's membership and tenants throughout the South.

Union leaders H.L. Mitchell, Clay East, and others hoped to build a more democratic society in the Arkansas cotton-growing country, but the membership, for the most part, had more limited goals. Rank-and-file members wanted a division of AAA benefits consistent with the division of profits from crops under the tenancy system. If the union could win more for them, tenants would take it, especially if they secured their own land. But the story of the STFU is one of a desperate struggle by men and women to stop the unraveling of tenant farming inadvertently triggered by a government aid program.

Unintended Consequences: The Agricultural Adjustment Act

The AAA's designers hoped to aid agriculture through a program of crop restriction. Government officials told producers how much acreage to take out of production and paid them for each restricted acre. Theoretically, crop restriction would aid both landlords and tenants by forcing price increases while sustaining all producers until such price increases occurred. But, through various methods, the planters managed to keep the tenants' share of government payments. Planters often persuaded tenants to sign agreements waiving their rights to benefit payments. More often, planters simply renamed their tenants as laborers, who were not entitled to benefits. Furthermore, restriction of the number of acres in production reduced the planters' need for tenants, thereby encouraging widespread evictions of tenants.

Planters in the Arkansas Delta counties joined this trend away from tenancy. From 1930 to 1940, the number of tenants in Cross, Crittenden, Lincoln, and St. Francis counties fell 20 percent. Indicative of the relationship between the AAA crop-restriction program and this decline in tenant population is the fact that most of the decrease occurred between 1936 and 1940. Those ex-tenants who were retained as wage laborers were, to be sure, more fortunate than those who were evicted and could find no work in the crowded labor market. In a letter to the New Deal's chief relief administrator Harry Hopkins, one of these unemployed former tenants described his plight: "I have Bin farming all my life But the man I live with Has Turned me

loose taking my mule all my feed. . . . I have 7 in family. I ploud up cotton last yeare I can rent 9 acres and plant 14 in cotton But I haven't got a mule no feed. . . . I want to farm I have Bin on this farm 5 years. I can't get a job So Some one said Rite you." Tenants and ex-tenants in many parts of the South apparently accepted their losses with little protest. In northeastern Arkansas, however, they joined the STFU in an effort to preserve the social relationships that held the Southern plantation system together. They did not enter the union because tenancy assured them of comfortable lives; they did so because the alternatives were so much worse.

Arkansas Socialists and a Biracial Union

Arkansas Socialists organized African-American and white tenants into the union beginning in 1933. That year, a group of displaced tenants and unemployed workers complained to H.L. Mitchell, the operator of a dry cleaners in Tyronza, Arkansas, about plantation owners' practice of placing their favorite tenants in Civil Works Administration projects during the winter to reduce the planters' costs, thereby keeping the genuinely unemployed from getting the jobs. Mitchell, his friend Clay East, and the Tyronza Socialist Party led in the formation of an Unemployed League to protest this practice. When the League held a meeting to present its grievances to the state relief director, over 600 people attended, many of whom were former tenants. At the meeting, the relief director promised to take care of the people's complaints. Mitchell then disbanded the organization.

As a result of its leadership in the formation of the Unemployed League, the Tyronza Socialist Party gained a few more members. The protest of the League is more important, however, as an early expression of the growing discontent in northeastern Arkansas as plantation owners began to trim their workforce in response to the Depression. With the passage of the AAA and mandatory crop restrictions, planters evicted and/or reduced to day labor more of their tenants. Discontent grew with the number evicted. Mitchell and East met with representatives of the families at Sunnyside School on Fairview plantation and suggested that they organize a union. The men representing the Fairview families agreed with Mitchell and East that through a union they might be able to force an end to displacement.

From the beginning, the STFU included African-American members. Fairview's owner evicted black families and white families from his lands, as did other landowners in northeastern Arkansas. If the union could not win the support of both races, planters would use one against the other to undermine union activities. In the past, Southern labor organizations had tried to bridge the racial divide by organizing blacks and whites into separate organizations. Rarely had this approach proved successful in the long term. Isaac Shaw, one of the African Americans at the Sunnyside schoolhouse meeting, warned Mitchell and East against such a policy. He stated that blacks feared that if they joined an organization that did not include whites, they would become the targets of planter retribution. Shaw's argument convinced the founders of the STFU that African Americans and whites would have to be organized within the same organization.

Although the STFU did not adopt separate black and white organizations, most locals were still not integrated. The racial makeup of a local depended upon the racial makeup of the plantation from which members came. Because most plantations were either all white or all black, STFU locals were either all white or all black. If the union had pursued a more aggressive policy of integration, it would have had much more difficulty securing the white support that was a prerequisite for African-American participation. As it was, the two races joined together for major union functions, such as large protest meetings. This level of racial cooperation distinguished the STFU in the South.

Religion and the STFU

Having decided upon a racial policy, the founders turned to the task of recruiting members. From the beginning, the STFU used the evangelical Protestant religious idiom and traditions of most tenants to spread its message. Meetings resembled camp-meeting revivals as preacher-organizers such as Ward Rodgers, Claude Williams, and E.B. McKinney spoke about the sins of the planters and the righteousness of the tenants' cause. Claude Williams, stressing the importance of such appeals, observed that "religion speaks a language that southern people understand. Southern people know more about Moses and the children of Israel in bondage than about Jefferson and Washington." African-American preachers were especially important in the STFU's recruitment of members. Mitchell urged organizers to include ministers, such as A.B. Brookins, in their appeals to blacks as well as whites. White tenants and laborers felt that African-American preachers understood the condi-

tions in which they lived better than did most white ministers.

The STFU's use of religion and its racial policy reflected the leadership's understanding of the South in general, Arkansas in particular. All of the leaders were natives of the area or had lived there for extended periods of time before organizing the union. Mitchell, a native Southerner, had been in Tyronza for seven years. East had lived in the Delta all his life. E.B. McKinney had been a tenant and a long-time circuit-riding preacher in Arkansas as was Ward Rodgers. J.R. Butler, another Socialist who joined the union shortly after its formation, was from Pangburn, Arkansas, and had been active in labor organizing in Arkansas for years. Only Howard Kester, a West Virginian and Vanderbilt graduate who began working for the union in 1935, could be considered an outsider.

Hopes for Intervention—Fears of Planter Repression

Union leaders did not initially embrace direct action in their efforts to roll back evictions. Instead, they appealed for government intervention on behalf of evicted tenants and sought relief in the courts. Throughout the South, people believed that President Franklin D. Roosevelt's administration would take the side of those who suffered from the effects of the Depression. Government officials were concerned about the unintended consequences of the AAA, but for political reasons would not challenge local control of New Deal programs. Mitchell and the union's Executive Council then filed a lawsuit on behalf of the tenants evicted from the Norcross plantation based on Section 7 of the cotton acreage reduction contract, which, in theory, protected tenants both from being dismissed or displaced from their homes except for bad conduct. Both provisions protecting tenants were weak. As planters pointed out, Section 7 did not, in fact, compel them to do anything; they only had to "endeavor in good faith" to prevent displacement. Who could prove they had not been at least trying to retain the same number of tenants they had before the AAA? In addition, some would later argue that membership in or sympathy with the STFU constituted bad conduct. Therefore, those who were guilty of union activity could legally be put off the plantation. C.T. Carpenter, the union's attorney, argued that Section 7 provided legal protection against eviction for tenants, not just an expression of the government's hope that planters would provide that protection. He also contended that union activity alone did not constitute bad conduct and that tenants who joined could not, under the law, be evicted.

In the meantime, Ward Rodgers conducted public gatherings at which he denounced the actions of planters. These meetings triggered a campaign to destroy the union. The deputy prosecuting attorney for Marked Tree, Arkansas, had Rodgers arrested and jailed in Jonesboro, Arkansas. He charged Rodgers with conspiracy to overthrow the government, anarchy, and intimidation of landowners. Because Sheriff J.D. Dubard empaneled a jury of planters, Carpenter, who defended Rodgers, realized that a vigorous defense would be an exercise in futility. For this reason, he brought forth no evidence or witnesses. The prosecutor, on the other hand, introduced witnesses who testified that Rodgers threatened to lynch planters and to lead in the overthrow of the plantation system. The prosecutor also noted, for good measure, that Rodgers addressed a "nigger" as "mister" at a union meeting. As was expected, the jury found Rodgers guilty. The publicity the Rodgers case brought to the union proved to be vital to its continued existence. Socialist Party and liberal groups such as the American Civil Liberties Union (ACLU) and the Southern Organizing Committee (SOC) for Economic and Social Justice began protesting against the Rodgers verdict and the conditions of which the STFU complained. These groups, as well as the Strikers' Emergency Relief Committee, the Church Emergency Relief Fund, and others provided the union direct financial help.

Recognizing the problem the STFU posed, planters stepped up their campaign against the organization. Having failed to intimidate members and prospective members through disruption of meetings, illegal arrests, and other forms of harassment and now lacking the economic sanctions that had been fundamental to their control of the rural South, planters resorted to more brutal methods. This new phase of the planters' anti-union campaign began in a town named Birdsong. On March 16, a crowd of tenants gathered to hear the most prominent supporter of the STFU, Norman Thomas, speak. When Thomas began his speech, a group of planters and riding bosses, reportedly drunk, pulled Thomas from the platform and said "that they would take care of their labor, and weren't gonna have no outside interference from any white haired Yankee son-of-a-bitch." The mob then escorted Thomas and his entourage to the Tennessee line. After the attack on Thomas at Birdsong, attacks on prominent union members were numerous. Gangs fired into the homes of A.B. Brookins and C.T. Carpenter shortly after the Birdsong incident. On March

30, a mob fired on an African-American church near Lepanto and attacked a group of church members.

Planters also employed more subtle tactics in their war against the union. They encouraged Abner Sage, the minister of the Marked Tree Methodist Church, to set up an alternative organization called the Marked Tree Cooperative Association (MTCA). Although Sage denied that he was a puppet of the planters, a *New York Times* reporter noted that Sage consistently spoke for the planters through his letters to newspapers and to Senator Joe Robinson (D-AR). But the support for Sage's organization revealed more than the reporter understood. In his remarks, Sage expressed alarm at the STFU's racial policy that many white tenant farmers in the area shared. Although the MCTA attracted few followers in the beginning, it reminded Mitchell and other union leaders of the tenuous nature of the racial accord they had negotiated. Without progress in their struggle to redress their members' grievances, appeals such as Sage's might gain more widespread support from white members.

The Strike of 1935

Such concerns moved Mitchell to propose a strike in April 1935. As Mitchell wrote in July, the membership wanted "action and has for some time," and a strike would give them what they wanted. He proposed that cotton pickers demand $1.00 per hundred pounds of cotton picked, a 40- to 50-cent increase in the rate. If planters refused, pickers would go on strike. By the time Mitchell submitted the proposal to the membership, planters had announced their intention of reducing the picking rate. Not surprisingly, union members supported the strike plan. The action would begin at the end of September 1935 when the cotton had to be picked or it would die in the fields.

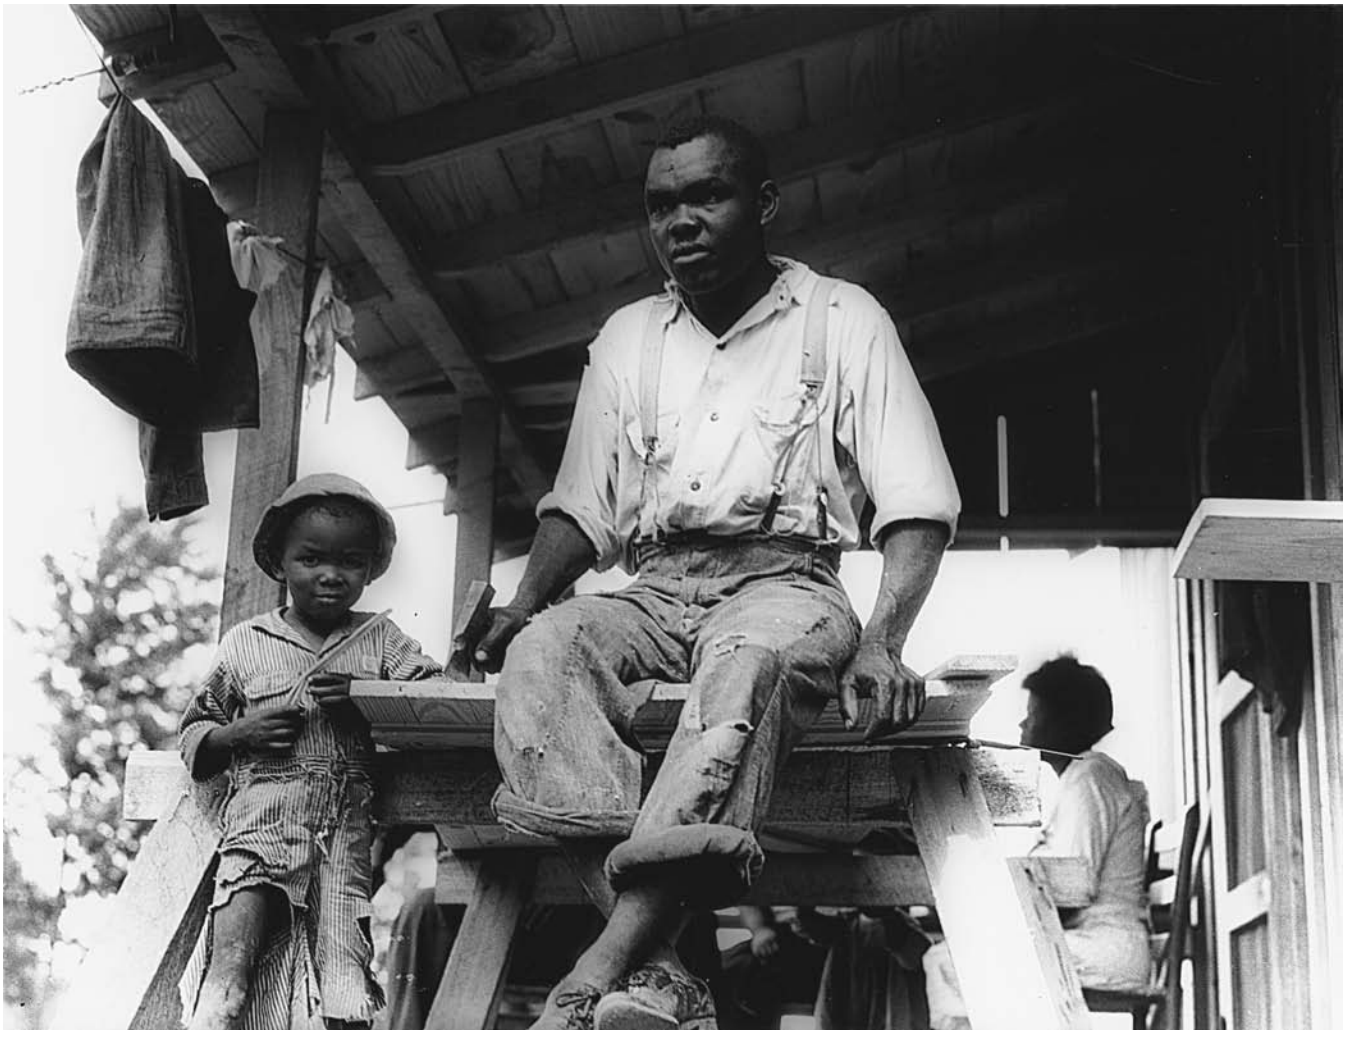
On the night of September 22, representatives from locals began spreading handbills throughout Crittenden, Cross, and Poinsett counties announcing the beginning of the strike. The next day, 4,000 to 5,000 pickers failed to report to work. H.C. Malcolm, Arkansas deputy labor commissioner, reported that he could only find five pickers working. Planters quickly began to grant wage increases to strikers rather than watch their crops rot in the fields. By October 4, when leaders called the strike off, most locals had won at least $0.75 per hundred pounds and many had won the full $1.00. Because the walkout surprised planters and strikers never directly confronted their employers, little violence occurred during the strike.

The ease with which the STFU won the 1935 strike fostered confidence in the union among eastern Arkansas tenants. Mitchell received more requests for organization of new locals than he and other organizers could handle. Those clamoring for organization knew they faced more evictions in the coming year and looked to the union to assist them.

Evictions

In early January, the expected new wave of evictions began. Letters to union leaders from displaced tenants pleading for help indicate the misery they suffered. J.J. Lynn, for example, wrote that since his eviction, he had no food, no money, and only a self-built shack with a dirt floor in which to live. He stated in a letter to Mitchell that he was "in the worst shape I ever were in in my life." As planters reduced the number of tenants on their lands before the 1936 planting season began, the number of people in similar circumstances would increase. Indeed, a plantation owner named C.H. Dibble intended to evict all the tenants from his place on January 16. In the first two weeks of January, STFU leaders concentrated on stopping the evictions of these families but failed. Dibble forced tenants out of their homes, onto roadsides in freezing weather, with no shelter or food. Other plantation owners offered them places if they would sever their ties to the STFU, but they refused to accept.

After Dibble evicted his tenants, union leaders appealed for donations to be used to provide the families with shelter and food. Kester wrote James Myers of the Church Emergency Relief Committee, Charles Garland of the Garland Fund, and Mary Fox of the League for Industrial Democracy to request relief funds from these organizations. Myers, who had already sent money for use in the union's relief effort, sent food and some tents and assured Kester of continued support as needed; the others soon sent money to assist the union. A few of the Dibble families were fortunate enough to be allowed to live in the Mount Zion church near Parkin, Arkansas; those for whom there was not enough room in the church lived in the churchyard in the tents Myers sent. For the next two months, the church and the tents would be home for the Dibble group as well as other displaced tenants. In addition, the Parkin church colony provided the union with dramatic evidence of planter tyranny with which to mobilize tenants and laborers. For some, such symbols were unnecessary. On the day Dibble ejected the tenants from his plantation, the St. Peters local of the STFU met to protest the planter's action and to demonstrate their determination to fight evictions. Unfortunately, plantation owners and local law enforcement agencies were just as determined to fight



A former Arkansas sharecropper builds a new house in Mississippi after being evicted from his land for joining the Southern Tenant Farmers' Union. The interracial union of poor farmers and laborers fought for higher wages and better working conditions and attracted thousands of members in the 1930s. Their actions were often met with violent resistance from planters. *(Library of Congress)*

the STFU. Shortly after the meeting began, a deputy sheriff arrived, disarmed those guarding the proceedings, entered the church, and ordered everyone to leave.

Union officials continued to appeal for assistance from the federal government, doubting the prospects of assistance from state and local authorities. Mitchell and the others thought they had convinced government officials to assist evicted tenants and to do more to prevent further such actions by planters. But when some in Cross and Wynn counties applied for government relief, they were rejected unless they were widows, orphans, or elderly. Local officials controlled relief programs and generally were reluctant to follow direction from Washington. STFU officials demanded more direct intervention from Washington but elicited little more than promises to investigate violations of the civil liberties of union members.

Such promises won for the union some national media coverage but offered little of substance to tenants facing eviction. Henry Craft, Jr. of Proctor, Arkansas, evicted twenty-four families from his plantation in early February. When planter George Berry ordered several families off his place, twenty-nine men, women, and children were left without food or shelter. On February 21, the STFU reported that hundreds had lost their places on plantations since the beginning of the month. Landlords told many of their former tenants that they could return in March if they wanted to work as day laborers. In the meantime,

they relied on more fortunate neighbors, and the STFU provided food, shelter, and clothes to displaced families; by the end of February, however, its resources were almost exhausted. Now the euphoria of the months following the successful 1935 strike gave way to doubts about the viability of the union. Tenants fearing eviction did not want to antagonize their landlords when the STFU proved helpless to do anything for them. A union official near Trumann informed Mitchell in early February that people there would not join the union. At least one union local folded during this period because its tenants lost interest in the activities of the STFU. Union leaders, understanding the need to act, in early March decided that the union would have to fight "with its only weapon," a general strike of all tenants and laborers in northeastern Arkansas.

The Strike of 1936

Mitchell distributed a strike proposal to locals that met with a tepid response. The unfavorable reaction of tenants to the strike proposal exposed a more deeply felt skepticism concerning union activities than union leaders thought. For example, J.J. Lynn, a union official in Poinsett county, the only county in union territory in which tenancy did not decline between 1935 and 1940, stated that tenants there did not consider a strike to be in their interest. Tenants on the Golightly plantation, in another county, would not even meet to vote on the strike proposal because they feared the owner would evict them. In mid-March, a local union official reported that two-thirds of his tenant members quit the union completely because they feared they would lose their places on the plantations if caught openly participating in union activities of any kind.

Predictably, evicted tenants were much more supportive of the strike proposal. After eviction they had no place to live and often had no food, shelter, or clothes. Even if a displaced tenant could find work as a day laborer, he usually could not earn enough to pay rent on a house, or to purchase food and clothing sufficient to his needs. People in this condition were quick to take the opportunity to strike back at those responsible for their misery. Although union records do not indicate what percentage of the over-6,000 votes for the strike came from evicted tenants, certain evidence suggests a relationship between loss of tenant status and support for direct action tactics. A local secretary, for instance, reported to union offices that four families did not decide to support the strike until a planter kicked them off of his plantation. More revealing of the connection between eviction and support for the strike was union leaders' decision to hold the strike only in St. Francis, Crittenden, and Cross counties, where displacement was the greatest in northeastern Arkansas, and to limit the action to day laborers. If the laborers could win a victory, the STFU leadership hoped, tenants might renew their commitment to the union.

During March and April, support for the proposed strike grew as the number of homeless people in northeastern Arkansas increased. On March 9, Henry Peters wrote Mitchell to report the eviction of four families from the H.J. Johnson, a plantation near Parkin. M.E. Holland reduced the number of tenant families on his land by four several days later. These and thirty to forty other families set up another tent colony on Highway 64 near Wynne, Arkansas. Lula Parchman, secretary of the STFU local at St. John, Arkansas, was among those who lost their places on plantations during April. She had been on the J.H. Blunt place since 1933, she wrote Mitchell, and did not want to start working as a day laborer. Parchman, like hundreds of other tenants, who suffered the same fate, believed that she could only gain from a strike against those responsible for her misery.

STFU leaders planned to hold the strike in May when cotton had to be "chopped" to keep grass from taking it. Day laborers would demand $1.00 per day for a ten-hour day and 15 cents for overtime. Usually, planters paid day laborers 75 cents to $1.00 for a day that began at sunrise and lasted until the sun went down. If planters entered into negotiations with the union before the May deadline, the strike would be canceled. Union leaders also would cancel the walkout if, as Jackson stated in a memorandum to President Franklin D. Roosevelt, the federal government took action on their complaints against planters. As expected, plantation owners refused to negotiate with the STFU. For a short while, however, it appeared that the federal government would act. Since becoming the STFU's representative in Washington, Jackson had lobbied for a presidential inquiry into conditions in northeastern Arkansas. He and Norman Thomas persuaded Rexford Tugwell to discuss the matter with President Roosevelt. In early March, the president brought up the Arkansas tenant problem at a cabinet meeting. Frances Perkins, the secretary of labor, urged the president to dispatch a government mediator to Arkansas to settle disputes between landlords and tenants. Because Vice President John Nance Garner feared such an investigation would embarrass Senator Joseph Robinson in an election year, little came of Per-

kins's suggestion or Mitchell's proposal for a government commission to investigate conditions in Arkansas. Officials at the Agriculture Department informed Mitchell that complaints had been investigated and found to be exaggerated; nothing more would be done.

Because further efforts to find solutions failed, the STFU leaders and rank-and-file were committed more than ever to a strike at the end of April. As in 1935, Mitchell had union officials in the three strike counties set up strike committees. Each committee consisted of a representative from every organized plantation in a local's territory. The committees were responsible for explaining the union's demands to members and for informing them of the time and date of the walkout. In addition, the local strike committee would negotiate with planters if they decided to negotiate with the STFU.

On May 18, 1936, strike committees began spreading leaflets announcing the start of the strike. Although the union claimed 4,000 to 5,000 strikers, reports from members, organizers, and others revealed limited participation. The events of the early part of the year, division within the union, and planters' preparation for the strike all contributed to its failure. Those who remained on the land or even had work as day laborers understood the risk they took if they joined the union. Clearly, planters were willing and able to simply dismiss strikers, thereby depriving them of a means to survive. Internecine bickering also undermined the union's credibility among many.

Under the circumstances, planters' well-planned response had maximum effect on those who did strike. Unlike 1935, planters made arrangements to import unemployed workers from Memphis to replace strikers. Mitchell, anticipating this strategy, enlisted the assistance of the Memphis Workers' Alliance in trying to discourage those who would go into the Arkansas cotton fields, but he failed to stop the replacement of strikers. Local law enforcement officers assisted the planters by arresting anyone who interfered with "strikebreakers." Deputy Sheriff Paul Peacher arrested thirty-five strikers for vagrancy and put them to work on a "county farm." By the end of May, the strike was hardly noticeable. Mitchell and union officials decided to call it off.

Conclusion

The Southern Tenant Farmers' Union would continue to exist in various forms through the remainder of the 1930s. But the failure of the 1936 strike marked the end of its effectiveness in fighting the effects of agricultural change in the South. Even if they had temporarily succeeded in rolling back evictions and other immediate effects of New Deal farm policy, they could not preserve the farms of rural Arkansas, or their ability to subsist in rural areas. The AAA began a long-term process in the South that encompassed mechanization of the cotton harvest, production of less labor-intensive crops, and the end of tenancy. Tenants and rural laborers rendered superfluous by such fundamental changes found their ways to the factories of the South's expanding the urban-industrial economy, if they were fortunate. Others joined the ranks of the chronically underemployed in the countryside and in the city. With its struggle to control this revolution in Southern agriculture for the people who worked the land, the STFU joined a lengthy list of similar failed movements.

Farmer-Labor Party

Minnesota's Farmer-Labor Party, and the larger movement of which it was a part, represents one of the most successful progressive third-party movements in American history. For about a twenty-year period, in the 1920s and 1930s, workers and farmers combined to elect hundreds of candidates to public office and promote an agenda that included fair prices for farmers and fair treatment of workers.

Although the seeds of third-party activism existed in many states, few movements flowered as the Farmer-Labor Party did in Minnesota. Situated at the boundaries of the industrial East and the agricultural West, Minnesota had both well-developed farmer organizations and strong labor unions. Leaders from both groups came forward at critical times to promote the formation of the party. The Minnesota movement, therefore, was in a position to take advantage of circumstances favorable to third-party formation—namely, an unpopular war and economic depression.

The history of the Farmer-Labor Party can best be understood in four stages: emergence (1917–1924), consolidation (1924–1930), high tide (1930–1938), and decline (1938–1948).

Emergence

In the first stage, emergence (1917–1924), two broad-based organizations, the Farmer's Nonpartisan League and the Working People's Nonpartisan League, joined forces to challenge Minnesota's ruling Republicans by running opposition candidates in the primaries. Although their immediate aims were different, the two movements found little trouble agreeing on a political program. Both opposed the state's business and political elites who controlled the agricultural markets and viciously fought workers' attempts to organize unions. Both favored programs to curb corporate powers through state regulations and public ownership.

In autumn 1917, organizers from the Farmer's Nonpartisan League crisscrossed the state, signing up 50,000 farmers on an antimonopoly program patterned after the successful effort of North Dakota farmers the year before. From the beginning, opposition was intense. League organizing took place during the heat of U.S. involvement in World War I. Main Street "patriots" broke up meetings and ran organizers out of town. The Republican administration carried on a campaign of harassment, branding both farm and labor militants as disloyal and jailing leaders for sedition.

Still, the organizing continued. In 1918, Congressman Charles Lindbergh Sr., father of the famous aviator, came within 50,000 votes of defeating Governor Joseph A. Burnquist in the primary. The Farmer-Labor coalition elected a respectable number of state legislators and firmly established itself as the second-most powerful political force in the state—well ahead of the hapless Democrats.

Key players in the formation of the Farmer-Labor movement were farmer Henry Teigan and labor leader William Mahoney. United by their Socialist political views, they saw the coalition as a natural step toward achieving real political power. In 1918, Mahoney convinced leaders of the Minnesota Federation of Labor to abandon the electoral philosophy of American Federation of Labor President Samuel Gompers and pursue an independent political course. Teigan wrote frequently for both farm and labor publications on the need for unity. Both men ultimately became elected officials—Teigan as a member of the U.S. House of Representatives in 1936 and Mahoney as mayor of St. Paul in 1932.

Other Farmer-Labor advocates came to Farmer-Laborism through religion, particularly the Social Gospel, and the Prohibition movement. The Rev. Howard Y. Williams, a Congregational minister from St. Paul, and Susie W. Stageberg, an evangelical Lutheran crusader from Red Wing, were attracted to Farmer-Laborism's high purpose and moral activism. Stageberg would be remembered, Millard Gieske

wrote in *Minnesota Farmer-Laborism: The Third-Party Alternative* (1979), as "the very personification of the religious disciple in politics."

Consolidation

The position of these activists and others who favored the creation of a genuine third party was strengthened by success in the 1920 and 1922 elections. In 1924, the two organizations founded the Farmer-Labor Federation—renamed the Farmer-Labor Association the following year. This event marked the beginning of the second stage of the movement's history, consolidation, (1924–1930).

The Farmer-Labor Association was the year-round, participatory body of the movement; the Farmer-Labor Party was its electoral arm. The development of a Farmer-Labor Party did not at first result in any dramatic improvement in Farmer-Labor fortunes. In 1924, the charismatic Hennepin County attorney, Floyd B. Olson, fell short in his bid to win the governorship. Throughout the rest of the decade, the association found itself swimming upstream, keeping its "loyal opposition" status in the legislature but unable to catch up with the Republicans.

Unlike many third-party efforts, however, the Farmer-Labor Party held together, less as a "movement" now with all the unfettered energy and participation the term implies, but as a viable organization. The continued support of the labor unions and the widespread network of ideologically committed Farmer-Laborites from both city and country kept the program and spirit alive.

A former dockworker and member of the Industrial Workers of the World, Floyd B. Olson served as governor of Minnesota from 1930 to 1936. Under his leadership, the state legislature passed many laws favored by the Farmer-Labor Party, including securities regulation, expansion of public works, conservation of natural resources, and aid to farmer and worker cooperatives. *(Minnesota Historical Society/St. Paul Daily News)*

High Tide

In 1930, the steady work paid off. Olson was elected governor, beginning the third and most successful period of Farmer-Labor history, the high tide (1930–1938). A gifted orator, Olson articulated the feelings of the one in five Minnesotans in search of work during the Great Depression and the many more who experienced both insecurity about their own situations and outrage about poverty and social injustice. The immensely popular Olson was elected governor three times and was a shoo-in for U.S. Senate before he died of a stomach tumor in 1936.

Olson's success was paralleled throughout the organization. Dues-paying membership in the association rose to almost 40,000 as organizers set up clubs across the state. Hundreds of Farmer-Laborites held elected offices at all levels of government—from city council to U.S. Senate. In 1936, Farmer-Laborites captured five of eight congressional seats, the governorship, and a solid majority in the Minnesota House of Representatives.

Political success was buoyed by the spectacular reemergence of mass movements. The Farm Holiday movement revived the dormant populist spirit of Minnesota farmers as thousands participated in strikes and direct action tactics to resist foreclosures. In Minneapolis, the Teamsters Union faced down the Citizens Alliance, the country's most notorious anti-labor organization, and won an epic battle that opened up the state's largest city to the labor movement. In 1936–1938, the newly organized Congress of Industrial Organizations (CIO) set northern Minnesota's Iron Range on fire with militant campaigns among timber workers and iron ore miners.

Labor and farm organizing was complemented by other efforts as well. The Workers Alliance set up councils of the unemployed across the state, leading

the fight for adequate relief and modern social security programs. Cooperatives of all kinds sprung up in town and country alike: electric power cooperatives, food cooperatives, marketing cooperatives, hardware stores, gas stations, and grain elevators. All of these movements allied themselves with the Farmer-Labor Association, oftentimes formally, as affiliated organizations. The association became the political extension of the great social movements of the 1930s.

Although the Farmer-Labor Party controlled the governorship for eight years, it was never able to control the state senate and was thus stymied in its efforts to enact its agenda. Pieces of the platform did become law, however, putting Minnesota in the forefront of New Deal–era reform. Successful Farmer-Labor legislation included a moratorium on farm foreclosures, ratification of the national child labor amendment, passage of the state income tax, and creation of thirteen new state forests.

Decline

The late 1930s signaled the end of the glory days of the Farmer-Labor movement. In 1938, Olson's successor, Elmer Benson, was overwhelmingly defeated by a reform Republican named Harold Stassen. The inability of successive Farmer-Labor administrations to solve the economic problems of the Great Depression; the people's weariness of class confrontation politics; a systematic anti-Semitic and anti-Communist campaign from both within and outside the association; and serious divisions within the association itself were all factors in the overwhelming Farmer-Labor defeat. The period of decline (1938–1948) set in.

With the United States' entry into World War II, the economy improved, and most Farmer-Laborites joined enthusiastically in support of the war effort. There was little inclination—and less of a constituency—for vintage Farmer-Labor antimonopoly politics while the war continued. In 1944, the association merged with the Democrats to become the Democratic-Farmer-Labor Party (DFL). Unity prevailed until the war's end.

In 1946, the struggle for the political direction of the new party began. Farmer-Labor opposition to the consolidation of corporate power and the Cold War politics of President Harry Truman's administration met head on with the corporate liberalism of the Democrats. When Farmer-Laborites moved to endorse the independent presidential candidacy of Henry Wallace in 1948, the Democrats, led by young Hubert Humphrey, united behind Truman. In a brutal six-month battle fought in precinct and district caucuses across the state, the Democrats soundly defeated their opposition. The Farmer-Labor wing never recovered its influence and was soon subsumed by the Democratic forces within the party.

But the Farmer-Labor movement was far more than an electoral party. It was a genuine social movement with its own educational and cultural components. It was *participatory*, the collective expression of thousands: farmers, workers, professionals, and small businesspeople. Many had inherited their outlook from parents, participants in earlier populist movements and labor struggles. Thousands more came to the association through their own experiences.

Conclusion

The Farmer-Labor movement encompassed but extended beyond the association itself. The movement included the Farm Holiday, the CIO, and the cooperatives. In an organizational sense, these movements often connected directly to the association as affiliates. But even when they did not, the collective energy of popular protest in Minnesota formed the social soil in which the Farmer-Labor Association could take root and grow.

As participants in progressive social movements, Farmer-Laborites developed a political viewpoint and program that were far to the left of both the New Deal of the 1930s and the Democratic Party today. The Farmer-Labor program contained "socialistic" proposals (public ownership of utilities, banks, packing houses, railroads) without advocating socialism as a total system. Farmer-Laborites believed that economic democracy was a necessary component of political democracy, that the unchecked power of monopolies was the greatest threat to both economic security *and* individual freedom, and that workers and farmers had the courage and intelligence to reshape society.

To be sure, some Farmer-Laborites were indeed Socialists. Veterans of the Socialist Party formed the nucleus of the Nonpartisan League, organizing efforts among farmers in both North Dakota and Minnesota. Socialists were prominent in the Twin Cities labor movement as well. They provided much of the ideological leaven for the foundation of the Farmer-Labor Federation in 1924.

The fullest expression of the Farmer-Labor Socialist current was the famous "Cooperative Commonwealth" platform of 1934. The term itself, "Cooperative Commonwealth," was vintage American socialism. It symbolized an economic-political system based on individual freedom and the common good. It countered the dominant cultural image of a

free individual in a free market with a vision of a free *people* controlling both their political and economic institutions. The program itself, with its emphasis on grassroots economic organization through producer and consumer cooperatives, as well as state ownership, further reinforced this image.

But the imagery and poetry of the 1934 platform, while reflecting a continuous current within Farmer-Labor thought, was the exception. More typical was the platform of the Working People's Nonpartisan League in 1919. It would serve as a prototype for Farmer-Labor platforms throughout the 1920s and 1930s. It called for the eight-hour day and forty-four-hour week; the establishment of cooperatives; state compensation for injured workers; equality of men and women and equal pay; abolition of unemployment; and public ownership of railroads, banks, terminal grain elevators, and public utilities. The Farmer-Labor movement was nourished by diverse social traditions: the radicalism of the Finns on the Iron Range; the reform tradition of the Norwegians; the moral fervor of the Social Gospel; the crusading spirit of the temperance and suffrage movements; the populism of the Red River Valley wheat farmers; and the democratic dream of the Jeffersonian tradition itself.

The relationship between Communism and Farmer-Laborism was a matter of controversy throughout Farmer-Labor history. The American Communist Party supported the formation of the movement in the early 1920s, only to move to active opposition by 1924. Beginning with the United Front period in the latter half of the 1930s, the party once again actively supported the Farmer-Labor Association, adding strong organizing energy to the movement, but also creating conflict within movement ranks. Given the strength of anti-Communism in Minnesota and elsewhere, participation by party members provided the Republican opposition with a powerful political issue against Farmer-Laborites.

The Farmer-Labor movement had a lasting effect on Minnesota politics, not only in conventional political terms and in ideology, but also on the culture of civic participation itself. Not only did it elect hundreds to public office, keeping Minnesota's Democrats in their place, and challenging the dominant Republican Party for the top rung, but it produced in Floyd Olson a political leader of national stature—"presidential timber" according to the era's pundits. Even after the merger creating the DFL Party, the progressive populism that was at the heart of the Farmer-Labor movement influenced the careers of such exemplars of postwar liberalism as Hubert Humphrey, Eugene McCarthy, Walter Mondale, and, more recently, Paul Wellstone. Minnesota's Republican Party changed fundamentally as it coped with the Farmer-Labor challenge. From the election of Harold Stassen in 1936 until the emergence of President Ronald Reagan's conservatism in 1980, Minnesota Republicans accepted a positive role for state government—a core value of Farmer-Laborism. The success of the Farmer-Labor Party established a tradition of third-party efforts in Minnesota, the political space for electoral success by Green Party candidates at the local level and Reform Party (later Independence Party) governor Jesse Ventura in the early twenty-first century.

Students of American political culture credit Minnesota with a high level of civic participation and an underlying commitment to public action for the public good. This "moralistic" approach to politics and public life has multiple roots. Chief among them is the progressive legacy of Minnesota's Farmer-Labor tradition.

Farm Workers Labor Movement

One of the poorest occupations in the United States is that of the landless, migrant farm worker. During the twentieth century, most seasonal workers labored on the enormous farms and ranches in California. Historically, how have members of America's rural proletariat responded to their lack of steady work and income? By what collective actions have they sought to change the conditions that they face? Have their efforts been, on the whole, successful or not?

The Economic Context

Prior to World War I, agriculture in the United States was by and large family based and small scale. Independent family farmers, tenant farmers, and sharecropping families lived on the land that they cultivated. They directly consumed a goodly portion of what they raised. Production was fairly diversified, with a few specialized products, such as wheat and cotton, raised for domestic and international markets.

For historical reasons, California was an exception. After winning the Mexican-American War, the United States signed a treaty that promised to respect Mexican deeds for haciendas and ranchos, where large herds of cattle grazed on thousands of acres. Shortly after statehood was achieved in 1850, the California government, in hopes of encouraging economic development, sold much of the territory's unclaimed public lands. The government also sold a fair amount of land previously owned by Mexican citizens (partly because of real and alleged confusions over the content and location of deeds).

During the massive transfer of property, former Mexican estates were only partially broken up. Wealthy private investors, such as the Southern Pacific Railroad, shrewdly amassed prime farming property from the government, often through graft and corruption. A few thousand of California's wealthiest private proprietors soon owned most of the state's 128 million acres of arable land. Sometimes a company's real estate exceeded 100,000 acres, and single "plots" could take a day or more to walk across. As political historian and activist Carey McWilliams has noted, Henry George wrote in 1871: "California is not a country of farms but a country of plantations and estates."

By the time the government had completed its decisions about whether and how to transfer former Mexican landholdings, America's second industrial revolution had begun in earnest. After the Civil War, electrically powered machines were being invented and rapidly refined; and the transcontinental railroad was almost complete. Intrigued by the sales potential of America's enormous market, owners of California's gigantic farms soon invested in electrical-powered irrigation and underground pumps, harvesting machinery, storage facilities, and fertilizers, pesticides, and other chemicals. Modern railway technology (including refrigerated cars) enabled large landlords to focus on perishable fruits and vegetables that were in great demand and to ship them quickly to urban consumers in the Midwest and along the Eastern seaboard. Some ambitious growers branched out into ancillary businesses, such as food processing and preparation. (In the upper Midwestern states, in contrast, a clear division of labor developed between private farmers and large private processing companies, such as Campbell, Heinz, and Vlasic.)

The new machinery and facilities required lots of capital, which few of California's largest growers could amass by themselves. The state's financial institutions soon developed close ties with major growers. Complementary economic interests also led to friendships between leaders in California's booming agricultural sector and leaders of its transportation and utility sectors, creating a network of interlocking directorates among the state's wealthiest companies.

The titular owners of California's gigantic agri-

businesses seldom resided on their lands or directly worked the ground. Large growers, visiting their holdings from time to time, usually lived and worked in cities, where they helped set production goals and planned market strategies, and dickered with banks, railroad companies, and retailers on prices and rates. To run the farms, owners hired supervisors and small year-round crews that maintained machines and watched the crops. In addition, growers authorized the hiring of large temporary workforces to harvest crops for a few weeks each year.

Except for grains, which could be harvested by machines, many commercial crops needed to be harvested within days by hand (and in the cases of some fruits, within hours). Otherwise, the crop would spoil. An inadequate number of workers thus could create an immediate financial crisis for a large farmer—a crisis whose dimensions few private industrialists could appreciate.

The transient laborers were paid piecemeal for the number of pounds they harvested each day. Workers either rented housing from the growers (which sometimes might be merely a tattered tent) or huddled at night in makeshift camps along public roads. Often pickers were not allowed to leave the ranches in the evening and were forced to buy groceries, toiletries, and other daily goods at exorbitant prices in company stores. Temporary workers sometimes were paid in scrip. This was done partly to encourage purchases on the ranch, partly to deter workers from leaving early for better paying jobs, and partly to cover damage to property, which was deducted from the field hand's pay when the scrip was exchanged for cash at the conclusion of the harvest.

As soon as a harvest was completed, a large grower usually had no further need for the hundreds (and sometimes more than a thousand) field hands. They were quickly pushed and pulled to new ranches. Vagrancy laws punished stragglers, but the need for food and wages usually provided enough incentive to prompt workers to move constantly up and down the state, according to the harvest schedules of different crops.

Traits of Farm Workers

California's system of agriculture, featuring both large land holdings and a huge migrating workforce, has persisted for almost a century and a half. During that time, the ethnic and racial composition of the rural proletariat has changed dramatically.

At first, California's large agribusinesses recruited down-on-their-luck miners, Native Americans, bankrupt former farmers, and newly arrived Europeans. Toward the turn of the century, growers began to import laborers from China, Japan, Mexico, and Hawaii. By the 1880s, Chinese field hands made up more than half of the state's rural workforce. Later, waves of Japanese, Filipino, Mexican, and Middle Eastern immigrants provided most of the transient workforces that California's agribusinesses required. In the middle of the twentieth century, approximately two-thirds of the workforce was Spanish speakers from Mexico and the Philippines. In the late 1980s, growers began to rely on large numbers of non-Spanish speaking Native Americans from southern Mexico. Only for a few years in the late 1930s were a majority of the rural proletariat U.S citizens of northern European descent.

The ethnic diversity of the migrant workers has in some ways compounded their economic troubles. Not only are most of California's field hands very poorly paid and without secure jobs. They are shunned by most of white California, denied equal treatment when looking for housing and loans, and compelled to send their children to inferior schools and medical centers.

Throughout the twentieth century, members of the rural proletariat—regardless of national origins—tried to improve their material circumstances through individual and group actions. During boom years, many field hands migrated to cities in hopes of securing better paying jobs and, in the long run, of purchasing small amounts of property and joining the middle class. (Conversely, during early twentieth-century depressions, desperate urban workers in California sometimes would migrate to the countryside and seek work as pickers.) Of those who remained in the countryside, a large minority participated in local and spontaneous strikes and slowdowns in hopes of securing better pay and working conditions. A few farm workers attempted to create permanent labor organizations.

Partly because of the constant turnover among field hands (inasmuch as most workers leave sooner or later for the cities), the history of rural labor movements has been episodic. Different ethnic groups have become active at different times and have pursued different strategies and goals. There has been little organizational, ideological, or tactical continuity.

One can demarcate three periods in the history of California's farm workers' collective efforts to change working conditions. The first predated the New Deal and arguably was the most radical in terms of activists' aspirations. Chinese, Japanese, and Mexican immigrants, without outside support, launched strikes

and walkouts; and members of the Industrial Workers of the World (IWW) tried to organize a grand anti-capitalist, quasi-Anarchist labor movement across skill levels.

The second period coincided roughly with the New Deal. Once again, Mexican workers initially spearheaded local acts of resistance; but the social and political landscape had changed, partly because of the newly arrived field hands who formerly were small farmers in southwestern states, such as Oklahoma and Arkansas. The widely publicized sufferings of these workers prompted the federal and state governments to intervene in California agriculture and to provide services, such as resident camps, that would make the lives of citizens more bearable. Government interest in the plight of farm workers waned, however, once the United States entered World War II and white laborers found better paying jobs in military-related industries.

The final period of farm-worker resistance began in the 1960s and flourished in the early 1970s, when Cesar Chavez used boycotts to defeat growers and temporarily broke through big business's grip on California's government. The final period of activism ended in the mid-1980s, after George Deukmejian, a conservative Republican, became governor of California and rolled back many of the political rights secured by Chavez's movement organization, the United Farm Workers (UFW).

Walkouts and Wobblies

Many California growers in the nineteenth and early twentieth centuries believed that rural workers from Asia and Latin America were culturally passive and therefore more controllable than white-skinned laborers. Growers therefore repeatedly lobbied the federal government for the right to import field hands from abroad. Once on U.S. soil, non-European workers faced multiple forms of discrimination, ranging from daily exclusion from movie theaters and restaurants to the denial of opportunities to purchase stores and rent homes. Many white-skinned workers, competing with Chinese and Japanese immigrants for low-paying jobs, and many owners of smaller businesses, competing with larger companies that relied heavily on inexpensive Asian labor, formed the California's Workingmen's Party in the late 1870s and 1880s. The party called for an end to immigration from Asia, the deportation of Asians and the seizure of their property, and the strict restrictions on foreigners' rights to own businesses. As early as the depression of 1894, bands of unemployed white rural workers, partly out of resentment and partly in hopes of generating jobs, attacked the homes of Chinese and Japanese workers, forcing them to flee to cities, where they were attacked by urban white workers and small shopkeepers.

Despite their vulnerability, immigrant field hands organized local strikes and attempted to establish unions. In the 1880s, disgruntled Chinese workers staged brief walkouts to protest landowners' policies. Some labor leaders asked for recognition and support from the American Federation of Labor (AFL). The AFL refused to help, partly to protect its meager financial resources for winnable strikes and partly because AFL members held anti-Chinese prejudices and wished to protect jobs for "white" Americans.

In 1902 and 1903, Japanese and Mexican sugar beet harvesters joined forces and formed a union, despite growers' efforts to promote ethnic rivalries. The AFL once again refused the workers' requests for help, partly because it viewed workers from non-European descent as unfair competitors, who undermined the wages and employment opportunities of U.S. citizens. Meanwhile, the large landowners increasingly used the threat of deportation to reinforce the purportedly "naturally" passive propensity of nonwhite workers.

In 1905, a group of Socialist-leaning labor activists met in Chicago to form the Industrial Workers of the World (IWW). The so-called Wobblies advocated the creation of one large union that would unite workers across craft and skill levels, races, and ethnic heritage. According to the union's theoreticians, workers should secure new rights through general strikes, in which workers across all crafts and skills, in a spirit of solidarity, would stop working at once. The Wobblies were not of one mind about violence, despite their critics' frequent accusations to the contrary. Some Wobblies considered violence counterproductive and therefore advocated nonviolent actions. Some believed that violence could on occasion be productive but was usually unnecessary. A vocal minority of Wobblies believed that violence, when applied wisely by workers, could be productive and in America probably was necessary.

Most Wobblies, regardless of their outlook on violence, considered themselves bitter rivals of the AFL. According to IWW spokespersons, the American Federation of Labor pursued only winnable strikes and was inspired by a narrow dream: the improvement of wages for skilled workers. The AFL (the Wobblies said) simply wanted to reinforce the economic status quo, to nurture quiescence among well-paid skilled workers, and to ignore the plight of the most vulner-

able workers in the land, who were overwhelmingly either low-skilled or unskilled.

The AFL's behavior partly accorded with the Wobblies' analysis. Seeing farm workers in California as too indigent, transient, and legally vulnerable (because of their immigrant status) to organize, the AFL's leadership decided early in the twentieth century to abandon the countryside and to focus on organizing artisans and skilled factory workers in the cities. Seeing a political opportunity, the Wobblies soon began to communicate with and organize farm workers in California, especially those of Asian and Mexican descent.

In 1913, approximately 100 Wobblies joined a spontaneous strike at a ranch outside Wheatland, a small agricultural town in northern California. The Durst brothers, the state's largest single employer of agricultural labor, owned the ranch and, to secure a large enough workforce for the one-month hops harvest, advertised widely for workers. More than 2,800 workers arrived, but only half that number was in fact needed. This situation contributed to depressed wages and left hundreds of hungry and desperate families stranded in Wheatland without employment. The field workers who were hired were angered by the absence of toilets and drinking water in the fields (where temperatures exceeded 100 degrees by noon). At night, no shelter was provided, save dirty straw and ragged tents that the ranch rented to workers at exorbitant rates. Last but not least, the wages for harvesting at the Dursts' ranch were far less than the newspaper ads had promised and were appalling even by the standards of California agriculture. Facing unusually demeaning working conditions, many pickers in Wheatland planned to protest even before the IWW activists arrived.

The Wobblies quickly organized a general strike in the roughly dozen rural communities surrounding the Dursts' ranch. The Wobblies also held public meetings, circulated radical literature, and aided the workers in drafting a list of demands. At one rally, a sheriff's posse arrived and tried to disperse the crowd. In the heat of the moment, some members of the posse accidentally fired their guns, prompting a melee, in which four people (including a deputy sheriff and a district attorney) died.

California's political elite was stunned by the turn of events. Large growers were outraged and declared that a revolution was taking place, not because of deplorable wages and working conditions, but because of outside agitators spreading anti-American beliefs. Growers quickly hired a private detective agency to search for Wobblies throughout the state. Meanwhile, to restore order to Wheatland, the governor dispatched four companies of the National Guard. Over the following months, more than 100 Wobbly organizers were arrested, beaten, and held in prisons on grounds of fomenting violence for the purpose of undermining established patterns of property (even though many had in fact counseled nonviolence). State judges sentenced two of the Wobbly activists who had been present at Wheatland to life imprisonment.

The so-called Wheatland riot was in many ways a turning point in the history of farm workers' movements. In the course of covering the events, the popular press began to investigate the plight of field hands. This, in turn, led to growing popular outrage toward big growers. According to journalist Dick Meister and labor historian Anne Loftis, an editorial in the *Sacramento Bee* denounced the growers' "absolute disregard of the rights of others." Even the relatively conservative AFL openly denounced the condition of farm workers as well as the governments' and growers' undue repression of the Wobblies.

The public outcry prompted action by Governor Hiram Johnson and his fellow Progressive Party members in the state legislature. They created a Commission on Immigration Housing that investigated the events at Wheatland. The Commission's report denounced the growers' treatment of harvest workers. The government also began to enforce labor statutes more rigorously. Backpedaling, large growers began to improve work conditions—for example, installing bathhouses, water hydrants, and enclosed toilets—in hopes of obviating further legislative action.

Meanwhile, IWW activists, afraid that the owners' actions would placate farm workers, criticized the government's investigations and businesses' actions as illusory and minimal. Allegedly, such reforms might distract workers and prevent them from understanding the need to form independent unions and sooner or later to seize property from private growers through general strikes. Workers should be able, according to Wobbly literature, to tell a boss where, when, and for what compensation they would work. This would require, sooner or later, a complete transfer of property from absentee landlords to those who directly tilled the land. To recruit and motivate members, IWW writers and speakers employed incendiary language that exaggerated the purposes and consequences of local acts of everyday resistance. For example, they talked about workplace "sabotage" when

referring to a simple slowdown to pressure owners to raise wages.

In 1915, a group of Wobblies formed the Agricultural Workers Organization (AWO), the first broadly based farm workers' union in U.S. history. Unlike earlier IWW organizations, the AWO played down radical rhetoric and concentrated on winning short-term benefits for workers. For a few years the union succeeded in organizing strikes leading to basic pay raises, overtime pay, and better housing. At one point, more than forty IWW and AWO locals were functioning in California.

In some ways, 1915 was the zenith of California farm-workers' resistance. The actions of California's Progressive politicians and the successful strikes organized (but seldom initiated) by the Wobblies had led to a significant improvement in the material standards of living of California's farm workers. The formation of the AWO seemed to foreshadow the creation of a permanent workers' organization with political clout. But the workers' victories proved to be short-lived.

The California government, which temporarily had sided with workers and had challenged the prerogatives of growers, returned to its old ways. By 1915, the Progressive movement had begun to disintegrate, partly because of members' disagreements over economic policy and over the wisdom of the United States' plans to enter World War I. In 1919, California governor William Stephens, a politician with socially conservative views, helped the state legislature pass the so-called Criminal Syndicalism Law. This piece of legislation prohibited not only acts of violence, but also the teaching of doctrines that encouraged changes in industrial ownership through the use of force. With this law in hand, state and local government officials began to arrest, try, and convict labor organizers who were planning violent attacks on growers and illegal seizures of property.

Meanwhile, California's growers, in the wake of the Wheatland debacle, formed several political organizations, perhaps the most famous of which was the Farmers' Protective League. The League hired private guards and detectives to spy on and harass union activists, lobbied the state legislature to pass laws against the IWW, and pressured newspapers to publish stories favorable to the growers' particular view of agricultural conditions and unions.

Last but not least, the United States' decision in 1917 to enter World War I effectively ended the Wobblies. Since 1915, the IWW had vigorously opposed U.S. entry into the war and had called it "a businessman's war" motivated by profits and indifferent to the working-class lives that would be lost. After 1917, the Wobblies carefully avoided openly opposing U.S. participation; but their ongoing support of strikes was viewed as unpatriotic and detrimental to the war effort. In the popular press and on the floors of the state and national legislatures, Wobblies were denounced as traitors and, at worst, German spies and, at best, spineless draft evaders. Police and other security agencies invaded the Wobblies' offices and seized union funds.

After the war ended in 1918, opponents took advantage of the Wobblies' open support for the Bolshevik revolutionaries in Russia to brand them, once again, as disloyal and anti-American. William Stephens received a bomb in the mail, which he attributed to the work of IWW assassins (an accusation that was never proven valid). According to Meister and Loftis, Stephens and his aides characterized the Wobblies as "huns of industry" and "the bitter enemy of all honest workers." Federal and state prosecutors, meanwhile, charged the Wobblies with engaging in "Bolshevik conspiracies." The Wobblies' legal rights to mail union and party literature were suspended, and their opportunities to raise funds for legal defense were severely reduced. By 1926, both the IWW and AWO were bankrupt and were rapidly losing members, partly because many key leaders had been deported. Most key theoreticians and tacticians who had neither died nor been imprisoned left the movement and joined either the more conservative AFL or the more explicitly pro-Russian Communist Party.

Shortly after 1920, real wages for farm workers plummeted, and living conditions once again worsened. The new laws that set higher standards for housing for transient workers no longer were enforced. Growers no longer feared strikes, for radical activists were deterred by fears of arrest; and the increasing use of vigilantes had intimidated most field hands.

Nonetheless, the first wave of farm-worker activism had not totally failed; for the Wobblies and the Asian-Mexican alliances had clearly demonstrated that farm workers in California could be organized despite their poverty and economic vulnerability. The Wobbly activists left behind a large body of songs, stories, speeches, and experiments in grassroots organizing from which later farm-worker activists would creatively borrow. Finally, the dramatic collapse of the Wobbly movement taught some farm workers that only with the support of government could the growers be defeated. Without support from

government, any concession from growers was likely to be short-lived.

New Deals

During the early 1920s, California's farm workers were largely passive, even though their standards of living dropped steadily. Real wages, for example, declined 50 percent between the beginning and end of the decade. But proletarian quiescence was short-lived. Farm-worker activism became more common and frequent during the 1930s. More than 140 strikes, involving more than 125,000 field workers, took place in that decade.

Economic disaster partly explains the abrupt revival of protests. With the advent of the Great Depression, starvation became an immediate problem; and cities no longer offered a viable alternative for the rural poor. The countryside was filled not only with traditional field hands, but also with hungry former city dwellers in need of work, and with former small farmers from the Midwest and Southwest who had been evicted from their lands. Basic biological need fueled workers' demands for better wages, decent housing, and reasonable prices in company stores.

In addition, approximately half of California's farm workers between 1935 and 1940 were white-skinned, and many came from the American heartland and carried with them the expectations and pride of small farmers. These poor field hands were not social radicals, for they remembered independently managing their own property and retained hopes of one day earning enough to purchase a small farm or urban business. But they were hostile to big businesses (including banks), and believed that land should belong to those who labored on it.

Although reputed to be passive, Mexican field hands were the first to protest against the steady deterioration of wages. Because of new legal restrictions on the immigration of Asian workers, by the mid-1920s Mexicans had become the largest nonwhite contingent of field workers in California. Excluded from Anglo schools and barred from restaurants and movie theaters, Mexican laborers and their families established their own *barrio* settlements, in which Spanish-speaking mutual-aid societies, defense lawyers, and local unions thrived. Beneficiaries of organizing spaces and ties of loyalty, Mexican field hands began to stop working if they felt that wages were too low or that working conditions were too brutal. By 1928, the numerous strikes by immigrants from Mexico had prompted growers to call in government officials to arrest and deport strike leaders.

The actions attracted the attention of a new radical labor organization, the Trade Union Unity League (TUUL), which the Communist Party had established in 1929. The League's long-term goals resembled those of the IWW, as both organizations were devoted to the creation of a single, large union that crossed ethnic, racial, and craft lines. In 1930, TUUL members began working with Mexican strikers, led a few strikes, and tried to hold a conference with representatives for field hands and packing-shed workers. These actions troubled growers and government officials. California's Criminal Syndicalism Law gave the authorities the legal instrument that they needed. More than 100 TUUL activists were arrested and convicted of fomenting the violent overthrow of established property relations.

Shortly afterward, the Communist Party established a new political action group, called the Cannery and Agricultural Workers' Industrial Union (CAWIU), which attempted to assume the leadership of wildcat strikes, usually at the request of strikers. Typically, CAWIU activists would hear of an upcoming labor action, travel to the site, and set up so-called tent cities with armed guards to keep nonworkers away. Within these proletarian settlements, workers elected racially mixed strike committees, which drew up demands and planned collective actions, such as caravans of trucks with huge strike signs that would drive along the borders of farms and ranches.

The CAWIU and Mexican activists jointly launched several major strikes during the early 1930s. At first, the strikes typically failed. Growers brought in hungry strikebreakers from Mexico, and organized vigilantes who, with the tacit support of local police, attacked picketers with lead pipes, chains, and guns.

As time passed, the CAWIU learned how to mobilize a more effective antigrower coalition by appealing to and drawing resources from small growers and urban sympathizers. As a result, most local crop-wide strikes were successful by 1933.

Growers were not easily defeated, however. The Great Depression had severely reduced sales and profits, and many growers found themselves deeply in debt. Higher wages were not a luxury that the growers could easily afford. In 1934, a group of major rural and urban business groups in California—including Pacific Gas and Electric, the Southern Pacific Railroad, and the Bank of America—funded a new business association, called the Associated Farmers. Members of the Associated Farmers insisted that unions were "un-American" and represented the first step in the overthrow of the U.S. system of govern-

ment and society. The organization kept files on union activists, refused to hire known labor activists, and regularly turned over lists of names to the federal government and to local law enforcement agencies. The organization also financed local paramilitary units, such as the California Cavaliers, whose job was to stamp out un-American activity by force.

On the whole, local governments supported the Associated Farmers and banned workers' meetings and car caravans. Local police also openly aided and abetted the vigilantes, who used tear gas bombs and guns to break up peaceful gatherings of workers.

Suffering increasing violence and widespread arrests, farm workers began to doubt the wisdom of resistance; and strikes began to collapse by the late 1930s. It momentarily seemed that the growers would win the day and that workers would once again glumly but quietly accept their circumstances. In fact, the Communist Party, wishing to avoid an unpatriotic appearance during World War II, adopted a moderate Popular Front strategy and dissolved the CAWIU.

During this discouraging period, the hundreds of thousands of white field workers who recently had lost their farmland in Southwestern states suddenly became visible. Attracted to California because of handbills that described plentiful job opportunities, the so-called Okies (the name came from Oklahoma, though the migrants came from many different states) discovered both that the number of field hands in California vastly exceeded the number growers needed and that wages often dropped below subsistence level.

Literally starving, Okies on occasion launched spontaneous strikes. But more often the Okies, being former small farmers, scrupulously respected property rights.

The suffering of the Okies drew attention from an unexpected source: the New Deal reformers in Washington and in Sacramento. In 1938, Culbert Olson became the first Democrat in the twentieth century to be elected governor of California. Once in office, Olson revived the Commission on Immigration and Housing that had originally been created in the aftermath of the Wheatland riot. Olson appointed Carey McWilliams, a lawyer with strong sympathy for field workers and strong antipathy toward big business, to be the executive secretary of the Commission. McWilliams toured the countryside to publicize the plight of field hands, used radio announcements to encourage citizens to report on the growers' failure to meet housing standards, and supported numerous bills to improve working conditions for field hands. Most of the legislative initiatives, however, were blocked by California's Republican-dominated legislature and by the lobbying efforts of the Associated Farmers. Through indefatigable efforts to publicize conditions in the countryside, McWilliams succeeded in influencing how many Californians viewed the behavior of growers and the suffering of field hands. Temporarily, public opinion shifted against those who owned factories in the fields.

The popular uproar generated by John Steinbeck's immensely popular novel, *The Grapes of Wrath* (1939), drew the attention of citizens outside California to the economic plight of the state's migrant workers. New Dealers in the nation's capital were shocked to read about the sufferings of white-skinned Okies. First Lady Eleanor Roosevelt traveled to California to see for herself if the conditions described by Steinbeck were true. She returned saying that, if anything, conditions were far worse than Steinbeck had reported.

Prompted by pro-union staffers, U.S. Senator Robert La Follette, Jr. (R-WI) reluctantly announced in the late 1930s that his Senate Committee on Education and Labor would travel to California and hold investigations into possible violations of workers' civil rights. After several weeks of public hearings, the La Follette commission concluded that California's local governments and growers had indeed flagrantly violated the rights of workers through blacklisting, strikebreaking, and vigilantism. Like President Franklin D. Roosevelt, La Follette recommended that the New Deal's National Labor Relations Act, which guaranteed industrial workers the right to assemble, form unions, and negotiate contracts, be extended to farm workers.

By the end of the 1930s, the nation's middle-class conscience had been pricked. The federal government, working with the California state government, created approximately forty camps where workers could live while searching for jobs. Within these camps, union organizers could speak with workers and plan collective actions, while the paramilitary groups funded by growers were banned.

Growers viewed these government centers as places where "Reds" could plan the overthrow of America's economy. Growers therefore used their political clout to limit the further development of migrant workers' camps, as well as to prevent passage of a broader national labor relations act that would give farm workers the rights to form unions, engage in collective bargaining, and participate in binding arbitration. In addition, rural communities and local

associations that were supported by the Associated Farmers held outdoor book burnings, in which copies of *The Grapes of Wrath* were destroyed.

For a brief period toward the close of the 1930s, it looked once again as if California's field hands finally would secure permanent improvements in their living conditions and significant increases in their legal rights to challenge growers' policies. However, the government's concern about farm workers was soon overshadowed by the United States' entrance into World War II. Many California farm workers who were U.S. citizens either were drafted into the armed forces or left the fields for better paying jobs in the war industries. The federal government, meanwhile, was loath to discourage agricultural productivity or to promote economic conflict, and therefore backed away from forcing agribusinesses to allow unions.

The war, however, created an unexpected labor shortage in the countryside. California's growers argued that if they were to feed a nation at war, they would need a new batch of inexpensive harvesters. The U.S. government tried to alleviate the shortage by approving in 1942 the so-called Bracero program, which allowed Mexican nationals to work temporarily on U.S. farms but with the understanding that after the harvest season, the immigrants would return to their homeland. Once implemented, the Bracero program proved highly controversial. Its defenders ar-

gued that it sensibly gave growers the sizable labor force that was needed if Americans were to eat at affordable prices. Without the braceros (which loosely translated means "those who work with their arms"), growers allegedly would not find enough U.S. citizens willing to engage in stoop labor. Critics of the Bracero program argued that it kept wages artificially low by recruiting desperate workers who were too terrified and legally vulnerable to protest mistreatment by growers. In effect, a pliable workforce had been recruited.

In 1964, the Bracero program officially ended. By this time, the farm workers in California were overwhelmingly either Mexican Americans or Mexican citizens. The following year, the United Farm Workers, the largest and most successful farm workers' movement in California history, was officially established.

Chavez: Successes and Failures

In 1962, a middle-aged community activist named Cesar Chavez founded a labor organization, the Farm Workers Association (FWA), which a few years later would be rechristened the United Farm Workers.

As a child, Chavez lived on a small farm, which his father lost in 1937 when he was unable to pay taxes and irrigation bills. The dispossessed family eked out an existence as migrant laborers, and young Chavez, after spending year after frustrating year in more than fifty segregated schools, dropped out of formal education and through books taught himself about the Mexican Revolution and the ethical reasoning of Mohandas Gandhi, Henry David Thoreau, and various Christian saints.

Returning from military service during World War II, Chavez joined philanthropic organizations that worked for the betterment of poorer Americans.

CESAR ESTRADA CHAVEZ (1927–1993)

Chavez was born on March 31, 1927, near Yuma, Arizona, the son of a migrant worker. His childhood was spent moving about in Arizona and California, and he had an inconsistent education that ended after eighth grade. He became a migrant worker to help his family.

After two years in the Navy (1945–1946), Chavez returned to farm work, married, and settled in Delano, California. After moving to San Jose, he began reading about the use of nonviolence for social change. In 1952, Chavez met Fred Ross and became involved in the self-help Community Service Organization (CSO) in California, working among Mexicans and Mexican Americans. From 1958 to 1962, he served as its general director. During his service he also met Dolores Huerta.

In 1962, he and Huerta left the CSO to organize wine grape pickers in California and formed the National Farm Workers Association. Using strikes, fasts, picketing, and marches, Chavez was able to obtain contracts from a number of major growers. During a strike by the Agricultural Workers Organizing Committee of the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) in 1966, his organization merged with it to form the United Farm Workers Organizing Committee, which later became United Farm Workers of America (UFW). Chavez served as president of the UFW for the remainder of his life. Embracing nonviolent tactics, he conducted fasts that focused national attention on the farm workers' problems, as did the 340-mile march from Delano to Sacramento in 1966.

Chavez also launched a 1968 boycott against the table grape growers, mobilizing consumer support throughout the United States. By 1970, the UFW got grape growers to accept union contracts and effectively organized most of that industry. By then, the UFW claimed 50,000 dues-paying members, the most ever represented by a union in California agriculture. The UFW boasted a union-run hiring hall, a health clinic and health plan, a credit union, a community center and cooperative gas station, as well as higher wages. The hiring hall meant an end to discrimination and favoritism by labor contractors.

In 1972, the United Farm Workers, with Chavez as president, became a member union of the AFL-CIO. Chavez expanded its efforts to include all California vegetable pickers and launched a lettuce boycott, as well as extending his organizational efforts to Florida citrus workers. His successes in California were sharply diminished, however, as the result of a jurisdictional dispute with the International Brotherhood of Teamsters over the organization of field workers that began in 1970. In 1973, the Teamsters cut heavily into UFW membership by signing contracts with former UFW grape growers, but Chavez renewed the grape workers' strike. In 1977, the two unions signed a pact defining the types of workers each could organize.

In 1976, Chavez reorganized the union to improve efficiency and outreach to the public. He led another boycott in 1984 over the grape industry's refusal to control the use of pesticides. Membership in the UFW later declined, in part due to disputes between Chavez and his followers, some of whom accused him of nepotism. But the accusations did not harm his work or his legacy as a leading figure in the American labor movement. He died on April 23, 1993, while working to defend the union from a lawsuit filed by a major grower.

James G. Lewis

One group was the Community Service Organization (CSO), a Saul Alinsky-inspired assemblage that believed in organizing the poor into self-governing political blocks that then could make demands on local governments for improvements in public services. The key, according to this strategy, was to have members of an impoverished community discuss common problems and debate possible political solutions. Once they discovered how to formulate their own demands, members of a self-governing committee would develop confidence, which would lead to further demands and ultimately to greater political clout (or so the theory went). As long as they had outsiders speak for them, the poor would remain passive supplicants, abjectly dependent on the kindness of strangers.

After working on primarily urban projects, such as registering low-income voters and investigating discrimination in rental housing, Chavez decided to leave the CSO. He wanted to return to the fields and organize desperately poor migrant workers.

With family members and friends, Chavez established the Farm Workers Association. Chavez decided to avoid the term *union* because of the suspicions it might generate among growers and workers alike. At first, the FWA promoted self-help institutions within Mexican-American communities, such as credit unions and consumers' cooperatives. Needing financial

Cesar Chavez, speaking into a microphone, urges consumers not to purchase lettuce and grapes picked by nonunion labor. Chavez and Dolores Huerta, founders and leaders of the United Farm Workers, organized boycotts, strikes, marches, and other nonviolent actions to gain higher pay and better working conditions for agricultural laborers. *(Karen Eberhardt/Walter P. Reuther Library, Wayne State University)*

resources, meeting places, and legal contacts, FWA began to work closely with the Migrant Ministry, an arm of the National Council of Churches dedicated to helping the rural poor.

In 1965, Mexican-American field hands spontaneously struck for better wages against a group of powerful vineyards. The strikers asked the FWA to support the strike, and Chavez agreed to help, despite his reservations about possibly squandering his organization's limited finances. The Migrant Ministry, the leadership of the United Automobile Workers, and other labor organizations soon swung their support behind the strikers.

The strike against grape growers unexpectedly lasted more than five years, as growers once again engaged in armed intimidation. In the face of likely defeat, Chavez coined a novel strategy: the promotion of consumer boycotts of the growers' products. Chavez, a master motivator, also changed his organization's name to the United Farm Workers and proposed that a black eagle against a red and white background become the union's daring emblem. UFW activists traveled throughout the United States and spoke to students and parishioners about the need to boycott grapes and wines. Supermarkets that stocked the growers' products were boycotted until they stopped.

Because of past experiences and personal convictions, Chavez distrusted armed action and preferred moral suasion, electoral politicking, and legal action. To dissuade workers from engaging in violence and to draw outsiders' attention to the strikers' cause, Chavez led dramatic marches, featuring popular religious symbols, through the blistering heat of central California and undertook public fasts, some of which lasted more than three weeks. The UFW began to lobby legislators and endorse political candidates. By the end of the decade, Chavez had become arguably the most famous Mexican American of his time. *Time* magazine selected him as the magazine's "Man of the Year." Martin Luther King, Jr. and presidential candidate Robert Kennedy not only praised Chavez's commitment to nonviolence but also pledged to support the farm workers.

In the mid-1970s, Jerry Brown, the liberal governor of California, publicly endorsed Chavez's aim of unionizing all farm workers and helped pass California's Agricultural Labor Relations Act (ALRA), which granted farm workers the legal right to unionize and to elect their own spokespersons. The Act, among other things, created the Agricultural Labor Relations Board (ALRB) with powers to investigate the fairness of union elections, to judge possible contract violations, and to identify and resolve the sources of stalemate during contract negotiations.

For approximately five years California's farm workers used ALRA provisions to secure concessions from growers. Growers were required by law to allow union activists to enter fields at specified times and to inform laborers about their rights and legal options. Frustrated by Chavez's success in attracting outside supporters, some growers tried to avoid negotiating with the UFW by quietly signing contracts with the Teamsters. But the ALRB declared the Teamster contracts illegal and insisted that workers should vote on who would represent them, the UFW or the Teamsters. The UFW usually won these elections, allowing it by 1982 to negotiate 162 contracts that affected 75,000 farm workers.

In 1983, political conditions in California once again changed drastically. The newly elected governor

DOLORES HUERTA (1930–)

Born on April 10, 1930, in Dawson, New Mexico, Dolores Fernández moved as a child to Stockton, California, with her mother and siblings after her parents' divorce. After graduating from Stockton High School, she married, had a family, and divorced but eventually received an A.A. degree and a teaching certificate from the University of Pacific's Delta Community College. After teaching only a few months, she decided that she could do more for the impoverished farm workers' children in her class by helping their parents win more equitable working conditions.

Huerta cofounded the Stockton branch of a Mexican-American self-help association called the Community Service Organization (CSO) and began lobbying California state legislators to enact such progressive legislation as old-age pensions for noncitizens. While working for the CSO, she met and married another community activist, Ventura Huerta, but this marriage also ended in divorce.

In the late 1950s, Huerta met Cesar Chavez, a CSO official. Both eventually left that organization because the CSO refused to organize farm labor. In 1962, they cofounded the National Farm Workers Association (NFWA), forerunner of the United Farm Workers (UFW). In 1963, she was instrumental in securing Aid for Dependent Families (AFDC), for the unemployed and underemployed, and disability insurance for farm workers in California. By 1965, Huerta and Chavez had recruited farm workers, and their families, throughout the San Joaquin Valley. On September 16, 1965, the NFWA voted to join in the strike by the Agricultural Workers Organizing Committee for higher wages. The two organizations merged in 1966 to form the United Farm Workers Organizing Committee, which later became the United Farm Workers of America (UFW). The strike lasted five years. In 1966, Huerta negotiated the first UFW contract with the Schenley Wine Company. The grape strike continued, and Huerta, as the main UFW negotiator, successfully negotiated contracts that established the first health and benefit plans for farm workers.

In 1973, when the grape contracts expired, Huerta organized picket lines and continued to lobby. She was instrumental in securing unemployment benefits for farm workers the following year. The UFW organized the workers in the vegetable industry as well. When anti-union violence erupted, the UFW called for another consumer boycott. Huerta directed the East Coast boycott of grapes, lettuce, and Gallo wines, which led to the passage in 1975 of the Agricultural Labor Relations Act, the first law recognizing the rights of California farm workers to bargain collectively. In 1975, Huerta lobbied against federal guest worker programs and spearheaded legislation granting amnesty for farm workers who had lived, worked, and paid taxes in the United States for many years but were unable to enjoy the privileges of citizenship. This resulted in the Immigration Act of 1985. In the 1980s, Huerta cofounded the UFW's radio station and continued to speak and raise funds on behalf of a variety of causes, including immigration policy and farm laborers' health.

James G. Lewis

of California, a conservative Republican named George Deukmejian, denounced the ALRA, the UFW, and Chavez. According to Deukmejian, Chavez was a demagogue, unwilling to compromise and unable to speak truthfully about workers' conditions. Once in office, Deukmejian drastically cut the budget of the ALRB, appointed a pro-business politician to head it, and named judges to the California Supreme Court who lacked backgrounds in labor law. The cumulative impact of these actions was that the ALRB investigated fewer complaints by workers, and the Supreme Court frequently favored growers whenever the growers appealed decisions made by the earlier ALRB.

Cut from the political loop, the UFW began to splinter. Some rank-and-file members were discouraged by the failure of the highly legalistic ALRA strategy and lost faith in collective bargaining. By 1987, the UFW still held only thirty-one contracts. Other activists, such as Meta Mendel-Reyes, were frustrated by Chavez's refusal to delegate responsibility to mid-level union officials. Chavez insisted on personally overseeing almost all facets of his organization, which made it difficult for other UFW officials to make policy decisions in a timely manner. This ultimately contributed to the union's failure to complete many of its tasks, such as maintaining its medical clinics, certifying union elections, and administering retirement plans. Finally, more than a few leaders were troubled by Chavez's religiosity and his close ties to church groups. Some wanted him to be more of a secular trade-unionist. Others who held Chicano political beliefs wanted Chavez to make the union first and foremost an organization to help and protect Mexican

Americans and Mexican immigrants. The Chicanos were particularly troubled by Chavez's hostility to illegal immigrants from Mexico who, in Chavez's opinion, were too easily used as strikebreakers and who threatened the job security and opportunities of U.S. workers.

When Chavez died in 1993, many former farmworker activists, despite their admiration for his courage and spirit, expressed reservations about his authoritarian leadership, his non-Chicano and highly religious beliefs, and his legalistic style. Activists were not of one mind about why their movement had shrunk from 60,000 members in 1982 to less than 20,000 members in 1993, or about why the UFW had not sponsored a wildcat strike, major grassroots protest in over a decade. Few disagreed, however, that in the 1990s field hands were once again among the poorest paid of U.S. workers and that rural workers had yet to discover effective ways with which to advance their interests.

Conclusion

The history of farm-worker protests and movements in California highlights both the ongoing powerlessness of the state's rural workers and the economic and political power of California's agribusinesses. After a century of struggles, California farm hands remain among the poorest paid workers in America and still lack effective labor-law protection.

Political-process theorizing and resource-mobilization theorizing—two standard approaches to the study of social-movement development—illuminate important aspects of the history of California's farmworker movements. Workers, when striking, were often aided by outside organizers, such as the Wobblies in the 1910s, the Communists in the 1930s, and Chavez and his followers in the 1960s and 1970s. These groups helped local acts of spontaneous resistance become more large-scale and more successful. Moreover, as political-process writers would predict, changes in the political climate—especially shifts in California's party politics—help explain the surges and ebbing of slowdowns, strikes, and union activity.

Nonetheless, the resource-mobilization and political-process models of social-movement politics fail to highlight the impact of racism and foreign policy on the evolution of farm workers' movements, and fail to recognize the remarkable political resources of California's agribusinesses. Accusations of treason during World War I and World War II had a chilling effect on the development of farm workers' movements. Anglo-Americans' distrust of nonwhites hindered the development of coalitions between farm workers and other sectors of American labor. Meanwhile, growers' ability to promote paramilitary units, to shape media coverage of events, and to finance and lobby party politicians repeatedly offset farm workers' initial political and economic victories.

Such factors, not yet central themes in social-movement theorizing, must be kept in mind if we are to explain why farm workers' victories were so few and so brief. Although the movements enjoyed short-term successes, in the long run the power of California's growers (vis-à-vis farm workers) was never significantly diluted. The story of farm workers' movements thus cannot be separated from other "American" stories of racism, Cold War ideologies, and countermobilizations by agribusinesses.

American Agriculture Movement

The American Agriculture Movement (AAM) was a dramatic, short-lived farmers' protest movement that has, in recent decades, transformed itself into a more subtle, long-term farm and rural life issues organization. The movement sprang to life first among Colorado grain growers in the fall of 1977 and spread across the nation's farm belt on the wings of a call for an agricultural strike. The movement dramatized in stark relief the grievances of family farmers: a depressed farm economy, low prices, high operating costs, an unrealistic government policy, and weak farm advocacy groups. Organizers and supporters were reacting to the recent passage of President Jimmy Carter's Food and Agriculture Act of 1977, but they were also decrying historically ineffectual government farm policies that had ruinously promoted fencerow-to-fencerow production. The short-term solution was to strike and not plant in 1978 so as to bring about higher commodity prices. At the core of AAM's objectives, then and now, was the demand for 100 percent parity prices for all domestic and foreign consumer agricultural products. Neither the strike nor higher commodity prices materialized, however, and momentum and cohesiveness faded with failed legislative actions and the loss of media coverage in the early 1980s. AAM's political activism developed from early shortsighted demonstrations into more results-oriented political lobbying; because of this shift in strategy, AAM remains a voice in agricultural policymaking today.

Crisis in Agriculture

What compelled farm people of the late 1970s and early 1980s to politicize their situation was the disastrous economic state of agriculture following decades of major changes and shifts. AAM represented as much a protest against where farming stood and where it was likely to go, as it did a protest against how it had deteriorated to this level. By the 1970s, for example, farm families were laboring under staggeringly high—and relentlessly increasing—fixed costs (surging up nearly 200 percent) and interest rates (as high as 18 percent annually), while commodity prices had fallen by 50 percent.

During the course of the twentieth century, farming had become increasingly complex, industrialized, efficiency-oriented, mechanized, capitalized, international, and productive. These changes strained the structure of agriculture, subjecting it to chronic overproduction, low prices, and a greater need for capital, all of which worked to undermine farm economics and, ultimately, the prospects of affordable, let alone profitable, family farming. In its demands for price parity, AAM was reaching for a federal policy tradition that dated back to the 1920s when policymakers began measuring agricultural prosperity against the prosperous years of 1909 to 1914, also known as the "golden age of agriculture." Parity is an economic relationship characterized by strong agricultural prices that boost farmers' purchasing power to at least equal (on a *par*) with that of other laborers in the economy. AAM sought a remediation of the farm crisis through a federal policy commitment to 100 percent parity.

Despite the structural changes, the farm economy was relatively stable during most of the two decades following the 1950s; interest rates held at 5 or 6 percent, and farmers were able to meet their operating needs through low interest loans. Commodity prices had dipped after 1951, but parity was largely maintained with the assistance of government program price supports and production controls. These were also designed to reduce the number of smaller producers in the economy and thus sparked a significant rural outmigration that was still apparent into the 1970s. Unfavorable domestic and international changes beginning with the Food and Agriculture Act of 1965 soon created the context for protest throughout the Great Plains, Midwest, and other regions.

The Food and Agriculture Act of 1965 sought to bring American commodity prices in line with those on the world markets. As such, the Act lowered the price supports farmers had been receiving, and the strength of American commodity prices subsequently declined. American grain exports more than doubled, however, and prices jumped between 1968 and 1973 when the international market experienced crop failures, particularly in the Soviet Union. To fill this vacuum, the U.S. government urged farmers to increase fertilizing and planting. Unfortunately, petroleum prices, gasoline, farm machinery, and petroleum-based fertilizers were all on the rise as a result of escalating conflicts in the Middle East. Although the U.S. economy had begun displaying encouraging signs by 1976, the restoration of international grain production levels caused American farm prices to drop precipitously.

Farm Crisis Grows

That was also the year that presidential candidate Jimmy Carter promised farmers a program that would assure them cost of production prices. Yet when Carter became president and his Food and Agriculture Act of 1977 clearly only amended the Food and Agriculture Act of 1965, farmers realized that they were locked into another four-year term of unresponsive farm policy. The Act established a price floor much lower than the 1973–1975 average. Moreover, the contracts that the government proposed entailed that farmers would receive a combination of loans and direct payments toward a government-determined "target price" that was considerably lower than U.S. Department of Agriculture cost of production figures. It was this political and economic reality that dominated the conversations of Western grain growers Gene and Derrel Schroder, Jerry Wright, Lynn Bitner, and Alvin Jenkins who came together in September 1977, in Campo, Colorado, to discuss the possibility of an agricultural strike.

Agricultural Activism

Under these conditions, strike talk took root in fertile ground. Originally calling their group the American Agricultural Strike, the movement founders quickly organized a public meeting in Springfield, Colorado. They generated interest and support through extensive use of flyers and the media such that 700 farm men and women, coming from as far away as Texas, came together and agreed to set December 14 as the strike date and to establish Springfield as the national farm strike headquarters. On September 22, 1977, 2,000 movement supporters participated in a nationally televised rally in Pueblo, Colorado. U.S. Secretary of Agriculture Bob Bergland was in attendance and heard not only the concerns of the farm people but also their demand for 100 percent parity on all domestic and foreign agricultural products, as well as their threats to strike, to halt agricultural production and distribution, and to stop purchasing farm equipment on or after the strike date. Besides 100 percent parity, AAM's subsequent five-point demands included the halting of all imports of agricultural products that were domestically produced until 100 percent parity was achieved, and the creation of an entity that involved agricultural producers in policy formation.

Emergence of a Movement

AAM launched a movement strategy that made excellent use of demonstrations, rallies, tractor parades ("tractorcades"), a variety of publicity, and local activism to advance its cause. A rally held in Amarillo, Texas, on October 14, 1977, drew 5,000 supporters, while a smaller, though obviously symbolic, protest in President Carter's rural hometown of Plains, Georgia, brought in hundreds of farmers and tractors. Meetings and rallies were staged through the coordinated efforts of state and local organizers as well as traveling speakers. Together, according to AAM, they succeeded in establishing 1,100 local offices nationwide by January 1978. Cofounder Alvin Jenkins was also one of the movement's most effective speakers, reportedly pointing out to the farmers that without a change in farm policy and without their activism, "You're going to look awful silly five years from now, trying to chase down 3 dollars a bushel wheat in your $100,000 combine!" AAM's activities gained the support of the National Farmers Union and the National Farmers Organization, but not that of the American Farm Bureau, which prompted much bitterness among farmers and considerable confusion on the part of legislators.

From the outset, AAM strove to maintain a movement that was at once centralized and decentralized. The Springfield national headquarters planned for the impending nationwide strike and the upcoming January protest in Washington, D.C., while the state and local offices oversaw the local activism aimed at recruitment. Although the movement's founders and leaders managed the business side of AAM with the assistance of volunteers, any sort of formal structuring ended there. AAM avoided membership dues and

lists, appointing officials, and devising regulations, and anyone could speak on the group's behalf.

AAM successfully mobilized participants and was able to cultivate an initial commitment to the cause through a number of ways, especially by linking participation to the winning of political concessions. Public policy educator William P. Browne found that AAM's impressive organizing and recruitment owed much to the "social incentives" that AAM held out to farm men and women in terms of camaraderie and common interests at the meetings. Conversely, the incurring of negative social benefits, such as criticism or even intimidation by AAM, proved to be motivating factors toward participation as well. According to Browne, farm people also joined because of the tremendous early successes in gaining publicity and large audiences that seemed to suggest that the winning of political rewards was quite possible. Finally, many supporters believed it was necessary to confront and protest a political system that they held responsible for devising ineffectual agricultural policies that had financially abused them. The strength of these convictions explains why so many farm people would take part in the January 1978 Washington, D.C., protest, although the severity of their financial situation would ultimately weaken their commitment to the strike.

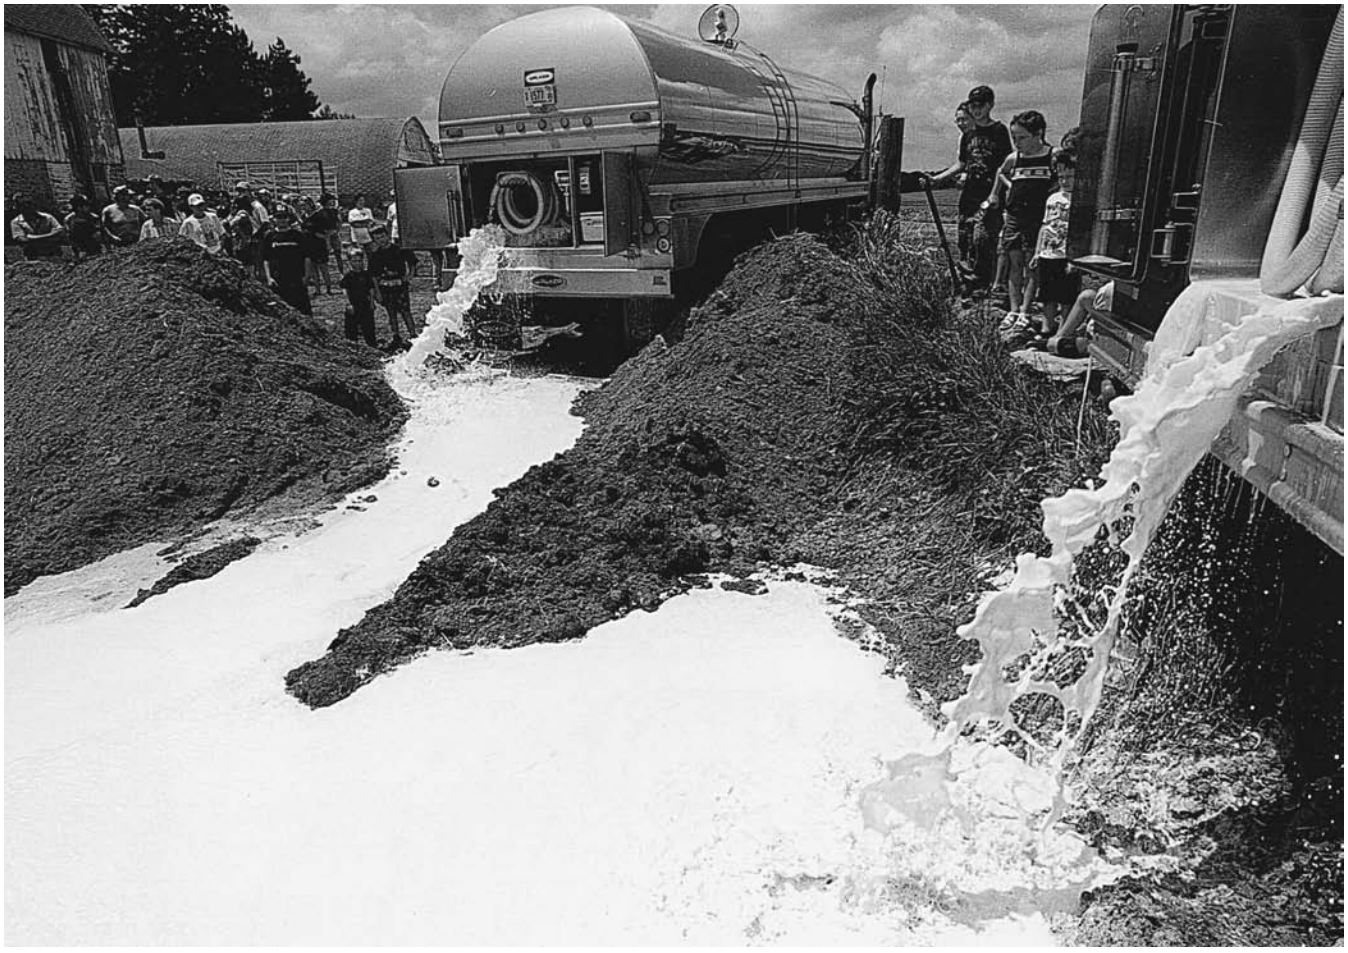
Farm Strikes

Despite nearly three months of media hype, mushrooming member participation, effective demonstrations, and tractorcades held throughout the country, in state capitals and Washington, D.C., the December 14 strike date passed by as a whisper, with Congress taking little notice. Farmer activism increased in response. To many farmers winter meant no planting, and the unresolved question of the strike and spring planting was as yet a ways off. AAM now began a series of tractor picketing at packinghouses and food distribution warehouses, wholesalers, and some railroads. Farm implement dealers and fertilizer companies supported AAM's goals but were concerned about the consequences to them of the threats to stop buying machines and supplies. Most importantly, AAM leaders were determined to quickly force some kind of congressional action by a show of solidarity and strength if necessary. From various points across the country in early January 1978, farm people and tractorcades converged upon Washington. The Texas tractorcade alone contained thousands of tractors and campers. When Congress convened on January 18, an estimated gathering of 50,000 farm men and women were on hand to greet them.

Lobbying Government Officials

Over the next four months, AAM state delegates and supporters aggressively lobbied for favorable legislation and appeared to have gained Congress's ear. They met with Senate and House Agriculture Committees, the U.S. Department of Agriculture (USDA), and President Carter, making officials personally acquainted with the problems of the farm economy. Subsequently, Congress approved a new farm loan program and a moratorium on Farmers Home Administration foreclosures. It could not, however, create long-term legislation for a new farm program in time for the 1978 growing season; instead it worked with AAM delegates in their call for short-term legislation to amend the 1977 Farm Act. In mid-March, Kansas Senator Robert Dole offered an encouraging compromise proposal for a flexible parity plan that was passed by the Senate (H.R. 6782). The act stipulated that wheat growers who set aside a percentage of their land would receive a target price of three dollars a bushel through so-called deficiency payments, with 5 percent price increases until the acreage set aside equaled 50 percent. Corn, cotton, and soybean growers were offered similar terms. Unfortunately for AAM, the Carter administration ably worked to defeat the bill in the House, pointing toward the USDA's March 3 report which depicted AAM's parity objectives as particularly threatening to retail food prices. When the bill reappeared as the Emergency Agriculture Act of 1978, it merely offered an upward adjustment in price supports of 11 percent. AAM saw the Act's passage as nothing short of a political sellout.

By spring, many AAM supporters had filtered back to their agricultural enterprises. The movement showed signs of suffering from both external and internal defeat. In reality, total adherence to the strike against planting would have imposed financial consequences that few farm families could have tolerated. When forty-nine prominent AAM participants were later asked if they themselves had reduced production in support of the strike, only 20 percent responded in the affirmative. Disillusionment began depleting the movement of its members even as it emboldened some of the remaining activists. The latter maintained AAM's public visibility through various means, including the publishing of a sharply critical newsletter, *American Agriculture News*, which was sent to several thousand subscribers. AAM's second major protest in the nation's capitol in January 1979, with its traffic-



To protest low milk prices, dairy farmers dump 80,000 pounds of milk on a Wisconsin farm on July 4, 2000. While the American Agriculture Movement has declined since its peak years in the late 1970s and early 1980s, it remains active in support of farmers' economic interests. *(AP Wide World Photos)*

snarling tractorcades and destructive behavior, put off supporters, officials, and the general public alike. At AAM's June 1979 convention, delegates reported that between 60 and 90 percent of their state locals were now in fact inactive.

The Farm Economy Worsens

As long as the farm economy remained in crisis as it did, even worsening in the 1980s, AAM had a rallying cause and a constituency. At the August 1979 convention, AAM restructured as AAM, Inc., firmed up its organization and strategies, and designated Texas cotton farmer Marvin Meek as chair. Meek made little inroads with the Carter administration, and even less with the Reagan administration under whose leadership farmers watched helplessly as parity fell to a meager 61 percent. In the early 1980s, AAM turned its energies to pressuring state governments and sought mortgage moratorium laws as well as commodity blockade laws designed to bolster commodity prices. AAM activists formed the American Agriculture Movement Political Action Committee in Washington, and they also began running for office. The October 4, 1986, *Economist* reported that at least five AAM farmer-activists were campaigning for House seats that year.

Although AAM continues to lobby for agriculture today, it has not survived intact. During the 1980s, several factions left AAM, Inc., to form Grassroots AAM, with original AAM founder Alvin Jenkins as chair. Little is known about this smaller group except that some members appeared to espouse more disruptive action, and that its strength emanated from eastern Colorado, western Kansas, and parts of Texas. AAM, Inc., developed a three point program to preserve independent farming

based on minimum commodity prices, inventory control, and supply management, as well as a plan involving production quotas resembling one proposed in the 1930s by Milo Reno of the Farm Holiday Association. Currently, AAM, Inc., also lobbies for rural issues and is part of the National Family Farm Coalition, an organization committed to promoting a unified farm program.

Moral Reform Movements

Introduction

Temperance, anti-vice, and social purity campaigns are an integral element of the history of American social movements. As the essays in this section explore, campaigns against alcohol, drugs, prostitution, homosexuality, sexually explicit materials, contraception, and abortion reflect deep-seated concerns about changing family structures, the role of women, the economic climate, industrialization, urbanization, and immigration. For two centuries, moral panics around these shifting dynamics have played a significant role in the formation of American social and governmental policy.

This section addresses the significant influence of a gathering social force from the late 1800s to 1920, comprised of a majority of middle- and upper-class Americans interested in social "progress" and "reform" known as the "Progressives." The movement was instrumental in changing the political, social, and economic landscape of the United States by injecting their form of moral superiority on working-class and poor Americans.

Common Prohibitionist Themes

In *Themes in Chemical Prohibition* (1979), drug addiction expert William L. White identified eight themes that pervade prohibitionist campaigns: association of the target substance (or activity) with a hated subgroup of society or a foreign enemy; identification of the substance (or activity) as being responsible for unrelated social problems such as crime, violence, and insanity; the idea that cultural survival depends on prohibition; a "domino theory" whereby the targeted substance (or activity) is said to lead to worse vices, addiction, or ruined health; an association between the substance (or activity) and the corruption—especially the sexual corruption—of children; the idea that the substance (or activity) is "contagious" and that users are recruiters; the idea that the substance (or activity) must be totally banned—rather than intelligently regulated—lest it overwhelm society; and attacks on those who question prohibition as themselves part of the problem. Although White focused on crusades against illicit substances, the same themes can be seen in campaigns to control stigmatized behavior, "deviant" sexual activity, sexually explicit materials, and politically unpopular speech.

Two Centuries of Anti-Vice Activism

In the 1800s, campaigns against prostitution, sexually explicit literature, and alcohol took place against the backdrop of industrialization and changing family roles as women entered the public sphere—both as workers and reformers—in increasing numbers. Early efforts against prostitution, alcohol, and drugs had a public health focus, but later took on an abolitionist tone.

The Comstock Law of 1873 set the stage for a century of battles against sexually explicit representation. Although the original Comstock laws were overturned by the mid-1960s, later laws against pornography and explicit music and art were often based on similar themes of social purity.

In the late 1800s and early 1900s, the Prohibition movement associated alcohol with crime, insanity, irresponsibility, and the corruption of youth. Similar themes carried over to the War on Drugs that entered the public consciousness in the 1980s—as did many of the unintended adverse effects of Prohibition, such as the development of underground markets and widespread lawbreaking. Alcohol and drugs were linked to immigrants and racial and ethnic minorities, from German brewers to Chinese opium addicts to Mexican marijuana users to black cocaine fiends. Alcohol and drug use were also linked to youth subcultures that challenged authority and prevailing social mores. The repeal of Prohibition in 1933 illustrated the shallow sentiment underlying the ban on

alcohol, demonstrating that the mainstream was concerned with curbing excess, not eliminating all use.

World War I, the Great Depression, and World War II ushered in major social changes and greatly influenced moral purity campaigns. Both war periods brought changes in the roles of women and intensified anti-foreigner sentiment. During the McCarthy era of the 1950s, middle-class women were driven back into the home and crusades raged against communism and sexual depravity, especially homosexuality.

The 1960s and 1970s saw a major period of liberalization, with the flowering of the civil rights movement, the women's movement, youth empowerment, and gay liberation. During these years, the Comstock Law banning contraception was overturned, the *Roe v. Wade* decision legalizing abortion was handed down, and several court cases narrowed prohibitions against sexually explicit materials. But as drug use became widespread and several types of crime increased, the stage was set for President Richard Nixon's "tough on crime" campaign and the intensification of the War on Drugs.

The election of President Ronald Reagan in 1980 signaled a new culture war, with renewed campaigns against abortion, pornography, and homosexuality. The Religious Right, with their traditional values agenda, became a major player on the national political stage. Multiple state and federal laws whittled away the right to abortion. Despite lack of evidence that pornography caused societal harm, religious conservatives and some feminists joined forces to promote increasingly restrictive anti-pornography legislation. Under the leadership of Senator Jesse Helms (R-NC), Congress stepped up efforts to deny federal funding for sexually explicit art and to ban AIDS education efforts that were seen as promoting homosexuality and drug use. The War on Drugs continued apace, with the public panic against drugs and drug users reaching a crescendo in the mid-1980s. As a consequence, the prison population exploded and the anti-drug crusade increasingly became a factor in U.S. foreign policy.

By the turn of the twenty-first century, the tide appeared to be turning once again. As happened during Prohibition, an increasing number of people began to decry the excesses of the War on Drugs and its unintended consequences. Harm-reduction policies, which attempt to minimize drug-related problems without insisting on abstinence, were increasingly accepted by the public health establishment. The Religious Right lost much of its political clout, and the Catholic Church became mired in a scandal over sexual abuse by priests. Nevertheless, conservatives were still able to employ fears about the corruption of children to push through abstinence-only sex education. The effects of the September 11, 2001 terrorist attacks remain to be seen, although the target of public panic and government control appears to have shifted away from sex and drugs to focus on foreigners, immigrants, and political dissidents.

The Making of Moral Panics

The nineteenth- and twentieth-century campaigns against alcohol, drugs, prostitution, pornography, explicit popular entertainment and art, homosexuality, pedophilia, and public sex have elements of classic moral panics. In his book *Sexuality and Its Discontents* (1985) sociologist Jeffrey Weeks defined moral panics as political moments in which diffuse social fears are channeled into agitation against an unpopular minority. "Sex panics, witch-hunts, and red scares are staples of American history," wrote historian Lisa Duggan in *Sex Panics* (1989). "While often promoted by powerless but vocal minorities hostile to cultural difference, they have been enthusiastically taken up by powerful groups in an effort to impose a rigid orthodoxy on the majority."

In *Thinking Sex* (1984), Anthropologist Gayle Rubin stated, "The criminalization of innocuous behaviors such as homosexuality, prostitution, obscenity, or recreational drug use is rationalized by portraying them as menaces to health and safety, to women and children, to national security, to the family, or to civilization itself." Judith Levine noted in *Harmful to Minors* (2002) that such panics tend to arise in times of transformation when people are anxious about social changes, traditional institutions are unstable, and authorities feel they are losing control. According to Rubin, "During a moral panic, such fears attach to some unfortunate activity or population. The media become ablaze with indignation, the public behaves like a rabid mob, the police are activated, and the state enacts new laws and regulations. When the furor has passed, some innocent erotic group has been decimated, and the state has extended its power into new areas of behavior."

Liz Highleyman and Benjamin Shepard

Moral Reform Movements in Postwar America

World War II brought a new round of social changes to the United States. In the prewar years, isolationist sentiment was prominent, but after the bombing of Pearl Harbor on December 7, 1941, mainstream America was ready for war. The rampant xenophobia of the day was most clearly exemplified by the forced relocation of people of Japanese descent—primarily from California—and their internment in concentration camps. Women entered the labor force in large numbers to replace men who had gone to war. For many women, this allowed an unprecedented degree of freedom and economic participation. Military leaders, well aware that soldiers would frequent prostitutes, promoted the use of condoms so that the men would not contract syphilis and pass it on to their wives and girlfriends back home. In the grip of patriotic fever and economic hardship, the country took a break from moral crusades; while vice was still unquestionably condemned, a more practical approach prevailed.

The end of the war sparked the beginning of a new backlash, ushering in what is widely regarded as the most conservative period in contemporary U.S. history. Middle-class women were forced out of the workplace and back into the domestic sphere. Aided by the GI Bill, many who could afford to do so left the cities for the suburbs. The idealized American nuclear family arose, and any diversion from this image was condemned. In the 1940s and 1950s, xenophobia, fear of left-wing radicals—in particular, "godless" Communists—anxieties about nuclear war, and renewed concerns about sexual immorality intersected in countless ways.

The Rise of McCarthyism

The first major American "red scare" began in 1919 in the wake of the Russian Revolution; before it ended, thousands suspected of holding dangerous radical sentiments were arrested, held without trial, and in some cases deported. But McCarthyism—a period of anti-Communist hysteria—was more far-reaching, extending into all areas of American life and ensnaring many who had no connection with political dissent. In 1952, deepening xenophobia led to the passage of the McCarran-Walter Act, which imposed more rigid entry restrictions for immigrants. In 1947, the House Un-American Activities Committee (HUAC) began to target Hollywood, attempting to root out any suggestion of anti-American sentiment. Academia was another favorite realm of anti-Communist crusaders. Before it was over, McCarthyism had ruined countless careers and lives.

Under the leadership of Senator Joseph McCarthy (R-WI) and Federal Bureau of Investigation (FBI) director J. Edgar Hoover, the dragnet rapidly expanded to focus on all forms of "sexual depravity," especially homosexuality. In 1948, Alfred Kinsey and co-authors published *Sexual Behavior in the Human Male,* followed in 1953 by *Sexual Behavior in the Human Female;* the books altered social discourse about homosexuality and other sexual variations. Kinsey and his Institute for Sex Research were accused of weakening the moral fiber of the country and rendering Americans more vulnerable to Communist influence. Homosexuality—which had only come to be seen as a distinct sexual identity around the turn of the century and was rarely mentioned in the social purity movements of the late 1800s—became a key target of moral crusaders. During this era, the government restricted employment of known or suspected homosexuals in federal jobs. Police raids of gay and transgender bars and surveillance and sweeps of cruising and commercial sex areas continued through the 1960s. In many cases, those netted in such operations were publicly exposed in the media.

Yet the increased repression galvanized homosexuals to fight for their rights. In 1951, at the height of the McCarthy era, Harry Hay—a Communist and la-

On October 23, 1947, a youthful Ronald Reagan, president of the Screen Actors Guild, attends a hearing of the House Un-American Activities Committee prior to testifying. A fervent anti-Communist, Reagan was elected president of the United States in 1980. *(AP Wide World Photos)*

bor activist—and others formed the Mattachine Society in Los Angeles. In 1954, the postal service banned the shipment of the group's *ONE* magazine under the still intact Comstock Law, the 1873 federal anti-obscenity law that prohibited the passage through the mail of "obscene, lewd, or lascivious" material. The 1958 *ONE Inc. v. Olesen* Supreme Court decision declaring that homophile literature could not be banned as obscene was the first ever high court ruling favoring homosexuals. The Daughters of Bilitis, a group for lesbians, formed in San Francisco in 1955. The San Francisco–based Council on Religion and the Homosexual, a civil rights organization comprised of early gay activists and progressive Protestant ministers, formed in 1964.

The 1960s: Birth of an Era

Although the countercultural Beatnik movement began in the late 1940s, it was not until the 1960s that a confluence of sweeping social changes ushered in a new era of liberalization in most aspects of American life. The civil rights movement for racial equality grew during this period. Major riots broke out in several U.S. cities. Rejecting the mandatory nuclear family of the 1950s, women increasingly entered the workforce and demanded social equality. The National Organization for Women formed in 1966. Middle-class youth on campuses became increasingly radicalized, and massive protests against the war in Vietnam—and against the ruling establishment in general—exploded

across the country. The new "unisex" fashion in clothing and hairstyles set off anxieties about gender-role nonconformity. Hippie youth flocked *en masse* to San Francisco's Haight-Ashbury district during the 1967 "Summer of Love," where they experimented with drugs, communal living, and new types of sexual relationships. After police raided the Council on Religion and the Homosexual's 1965 New Year's Eve costume ball, the American Civil Liberties Union (ACLU) sued and all charges were dropped, ushering in a new era of gay political power in San Francisco. The gay liberation movement burst into public consciousness nationwide with the Stonewall Riots in New York City in June 1969, when gay, lesbian, bisexual, and transgender bar patrons and bystanders fought back against police who raided the Stonewall Inn in Greenwich Village.

By the time Richard Nixon resigned in disgrace in 1974 following the Watergate scandal, respect for authority and traditional social mores was perhaps at its lowest ever ebb.

Contraception and Abortion

The U.S. Food and Drug Administration's approval of the first birth control pill in 1960 is widely credited with sparking the sexual revolution. But battles over contraception and abortion continued apace. Moral crusaders not only played on fears about the changes in middle-class women's traditional roles that would be brought about by the ability to control fertility, but also exploited anxieties about rapidly reproducing immigrants and blacks overwhelming Anglo-Saxon whites.

In the 1936 case *U.S. v. One Package of Japanese Pessaries* (a device similar to a diaphragm), federal judge Augustus Hand ruled that birth control could not be classified as obscene and loosened laws forbidding the importation of contraceptive devices. But it was not until the 1965 *Griswold v. Connecticut* decision that the U.S. Supreme Court, citing marital privacy, ruled that married couples had the right to use contraceptives. The 1972 *Eisenstadt v. Baird* decision extended this right to unmarried people. In the late 1960s, Pope Paul VI issued an encyclical condemning abortion and all forms of artificial birth control. Seen as a representative of foreign interests, the Catholic Church had not been instrumental in the social purity campaigns of the nineteenth century, but gained increasing influence—especially in cities such as New York and Boston—with the influx of Catholic immigrants. In the latter half of the twentieth century, the Catholic Church played a major role in the anti-abortion movement.

Roe v. Wade

The most celebrated victory in the fight for reproductive rights was the landmark 1973 *Roe v. Wade* decision, in which the U.S. Supreme Court ruled that abortion was legal during the first three months of pregnancy. As with the *Griswold vs. Connecticut* decision, the court based its ruling on the right to privacy. The first state laws against abortion had been passed in the mid- to late 1800s, and by 1910 most states had laws criminalizing abortion unless necessary to save the mother's life. Before the 1973 court decision, many women availed themselves of illegal abortions; while wealthy women sometimes could obtain legal abortions in other countries, women with fewer resources were consigned to "backroom" or self-administered procedures that led to many deaths.

Anti-abortion Movement

In the final decades of the twentieth century, religious and political conservatives stepped up their campaign against abortion. The National Right to Life Committee, spearheaded by the Catholic Church, was organized in 1973 to overturn *Roe v. Wade.* Both presidents Ronald Reagan and George H.W. Bush were sympathetic and politically indebted to the anti-abortion movement. Groups such as Operation Rescue targeted abortion providers, utilizing tactics such as blockades, which had been pioneered by progressive activists. In response, pro-choice activists—a coalition of women's rights advocates—responded by organizing "clinic defense" efforts. In the 1990s, there were numerous incidents of anti-abortion extremists bombing family-planning clinics and several shootings of abortion providers.

Anti-abortion activists succeeded in whittling down the scope of *Roe v. Wade* even while they failed to outlaw abortion entirely. Public funding of abortions for poor women in the United States was removed by the 1976 Hyde Amendment. Reagan's 1984 Mexico City Policy—better known as the "gag rule"—banned U.S. aid to international organizations that provide or discuss abortion. Most states enacted laws requiring women under age eighteen to obtain parental or judicial consent for an abortion. In the 1989 *Webster v. Reproductive Health Services* decision, the U.S. Supreme Court ruled that states could bar the use of public facilities for abortion. In the late 1990s, anti-abortion advocates began lobbying for laws banning late-term, so-called partial birth abortions. Fewer

medical schools provided training in abortion procedures; by the end of the decade, an estimated 85 percent of U.S. counties had no abortion providers. Concern about the appointment of conservative Supreme Court justices who could potentially shift the balance against *Roe v. Wade* was a major issue in the 2000 presidential campaign. The two major successes for pro-choice advocates in these years were the increased availability of emergency contraception (the "morning-after pill") in the late 1990s and the approval of RU-486 (the "abortion pill") in 2000, both of which had the effect of privatizing decisions about abortion.

In the latter decades of the twentieth century, moral crusaders were more successful in campaigns to restrict abortion than in efforts against sexual "deviance." This comparative success can perhaps be attributed to the fact that on the abortion issue, the value mainstream Americans place on privacy and individual liberty clashes with the emphasis they place on protecting children. Nevertheless, today many U.S. women use contraception, and polls show that—although support for choice has declined—a majority of Americans do not favor banning abortion.

Defining and Controlling Obscenity

Since the enactment of the 1873 Comstock Law, moral crusades related to sex have continued to play an important role in the history of U.S. social policy. Through the first half of the twentieth century, obscenity restrictions were leveled against many written works, including literary classics such as Geoffrey Chaucer's *Canterbury Tales,* James Joyce's *Ulysses* (1922), D.H. Lawrence's *Lady Chatterley's Lover* (1928), Henry Miller's *Tropic of Cancer* (1934), Allen Ginsberg's *Howl* (1956), and William Burroughs's *Naked Lunch* (1959). Explicit literature was associated with all manner of social ills ranging from obsessive lust to disregard for family responsibilities to the promotion of homosexuality and various forms of depravity. Following the familiar pattern, moral panics about sexual material were often linked to immigrants and racial and ethnic minorities—particularly Jews—who operated venues such as dance halls, produced objectionable films, and published erotic books.

One of the most infamous targets was Samuel Roth, a Jewish immigrant from Austria who produced and distributed by mail both sexually explicit and mainstream publications. In the mid-1950s, Roth was subpoenaed to appear before moral crusader Estes Kefauver's Senate committee to answer charges that his "lewd and lascivious" materials contributed to juvenile delinquency. Roth was arrested and prosecuted on several occasions for obscenity law violations. In the key 1957 *Roth v. United States* case, the U.S. Supreme Court struck a blow against the Hicklin test (the outcome of a British case from the 1800s), which held that a work was obscene if it was likely to corrupt children. Another strike against the Hicklin test was delivered earlier that year when the Supreme Court ruled in *Butler v. State of Michigan* that the adult population could not be limited to materials that are fit for children.

The 1973 *Miller v. California* case established the well-known three-prong test for determining whether material is obscene and thus not constitutionally protected: the average person, applying contemporary community standards, would find that the work, taken as a whole, appeals to the prurient interest; the work depicts or describes, in a patently offensive way, sexual conduct; and the work, taken as a whole, lacks serious literary, artistic, political, or scientific value. Under this decision—which remains the basis for today's obscenity laws—the most prudish standards of a minority cannot be used to determine what materials are suitable for an entire community.

With the *Roth* and *Miller* decisions, the Supreme Court affirmed that obscenity—that which appeals to "prurient interest" and is without "redeeming social importance"—is not protected by the First Amendment. However, it left obscenity rather ill-defined, as reflected in Justice Potter Stewart's famous remark that while he could not define smut, he knew it when he saw it. In the years that followed, the Supreme Court refined the three-prong test, defining "prurient interest" as a "shameful or morbid interest in sex"—not "normal lust"—and specifying that the "average person" does not include children. The Court also affirmed that indecent materials—defined as those in "nonconformance with accepted standards of morality"—are protected as long as they meet the conditions set forth in the *Miller* decision.

The Meese Commission

Much of the debate surrounding sexually explicit materials concerned the purported negative societal effects of pornography such as crime, the oppression of women, and harm to children. During the Kefauver Commission hearings, psychiatrist Dr. Benjamin Karpman testified that pornography leads boys into gangs and juvenile delinquency. According to the FBI's Hoover, "The increasing number of sex crimes is due precisely to sex literature madly presented in certain magazines. . . . It is creating criminals faster

than jails can be built." But by 1970, the President's Commission on Obscenity and Pornography (the Lockhart Commission) had found "no reliable evidence to date that exposure to explicit sexual materials plays a significant role in the causation of delinquent or criminal sexual behavior among youth or adults."

Sixteen years later, the Attorney General's Commission on Pornography—better known as the Meese Commission—revisited the issue. The Meese Commission amassed a collection of materials found in several adult bookstores—including hundreds of books and thousands of magazines and films. In fact, the Meese Commission's 1,960-page report may be the most extensive pornography database ever compiled.

The Meese Commission hoped to find scientific evidence to refute the conclusion of the 1970 commission that pornography does not lead to negative social consequences, but it had little success. Researchers such as Edward Donnerstein of the University of Wisconsin had found a connection between certain types of violent pornography and aggressive behavior, but did not find similar effects for sexually explicit but nonviolent material. Sociologist Edna Einsiedel, who was hired by the commission, concluded that "no evidence currently exists that actually links fantasies with specific sexual offenses." Some of the most negative testimony came from moral crusader Judith Reisman, who despite questionable methodology in her studies of sexually explicit cartoons in men's magazines still was unable to find much damning evidence.

Released after a year of hearings, the 1986 Meese Commission report contained several recommendations for restricting obscenity and pornography, including stepped-up enforcement, forfeiture provisions similar to those of anti-drug laws, definition of the hiring of porn actors as an unfair labor practice, use of pandering laws against pornography producers, and requirements against doors on peep show booths—which also became an issue in struggles over gay male sex establishments. In 1987, the federal government established the Obscenity Enforcement Unit, later renamed the Child Exploitation and Obscenity Section.

The Feminist Sex Wars

The Meese Commission hearings took place against the backdrop of a battle within the feminist movement that has come to be known as the sex wars. After the birth of feminism, tensions arose between moral reformers, who prioritized protection of women, and others, who emphasized women's right to self-determination. These tensions intensified in the late 1970s and early 1980s and led to bitter battles within academic and activist feminist circles. Groups such as San Francisco's Women Against Violence in Pornography and Media and New York City's Women Against Pornography promoted the anti-pornography view, while the Feminist Anticensorship Task Force, Feminists for Free Expression, and others—a tendency that came to be known as "pro-sex" feminism—argued against censorship. Anti-pornography feminists defined opposition to pornography as an essential tenet of feminism and in some cases acrimoniously attacked feminists who disagreed. Before they were over, the "sex wars" also came to encompass other areas of controversial sexual expression including sadomasochism, public sex, lesbian butch/femme roles, and sex work.

The crux of the feminist anti-pornography argument was that pornography objectified and degraded women, negatively influenced how women were viewed and treated by men, and ultimately led to violence against women. Perhaps the best known and most extensively developed anti-pornography position is that of author Andrea Dworkin and legal scholar Catharine MacKinnon. Dworkin and MacKinnon developed a so-called civil rights legal strategy that defined pornography as discrimination against women. Laws based on this theory would ban material that is "degrading" to women and allow women who felt they had been harmed by pornography to sue the producers and purveyors of such material. An ordinance along these lines was passed in Indianapolis, Indiana, but was invalidated as unconstitutional by the U.S. Supreme Court. In 1992, the Senate considered, but failed to pass, the Pornography Victims Compensation Act (nicknamed the "Bundy Act" after serial killer Ted Bundy, who blamed his crimes on exposure to pornography). A civil rights interpretation of anti-pornography law was established by Canada's 1992 *Regina v. Butler* high court decision; ironically—but not surprisingly—the first materials to be targeted were lesbian and gay erotica.

Anti-pornography feminists made sexually explicit material a scapegoat for the unequal position of women in society, seemingly ignoring the evidence that rape, violence, oppression, and exploitation of women long predated commercial erotica. Although they attacked nonviolent sexually explicit material, they rarely focused on the much more ubiquitous violent material that was not sexually explicit. Anti-pornography feminists did not call for less sexist

pornography made by well-compensated and well-treated talent, but rather demanded its total elimination. As had occurred in earlier decades, some moral reform feminists joined forces with religious and political conservatives. By the turn of the twenty-first century, the pro-sex faction appeared to have gained the upper hand within the feminist movement—pro-sex feminism is now well represented within academia and among younger activists—but the anti-pornography feminists' views have had considerable influence on mainstream thought and government policy, especially in the areas of prostitution and international sex trafficking.

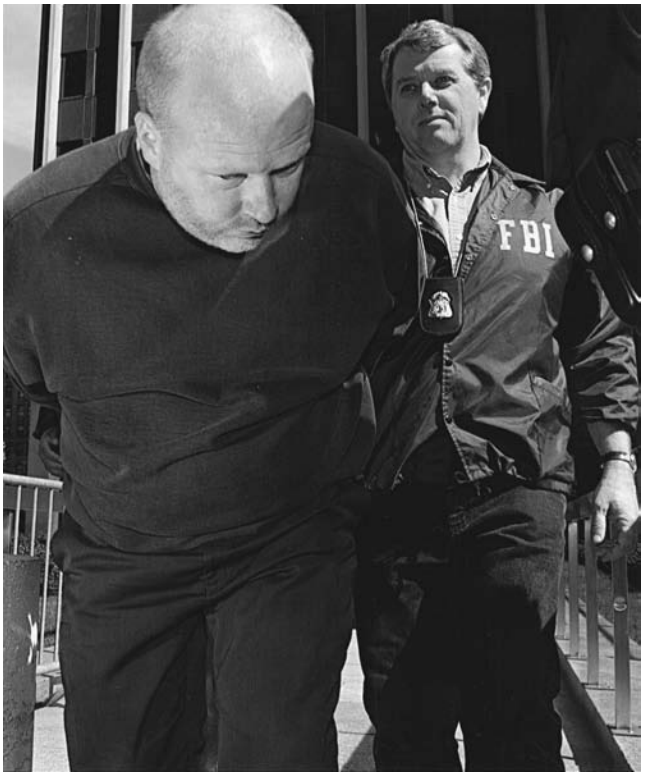
Social Conservatives and Popular Entertainment and Art

Moral purity proponents have been particularly critical of the corrupting influence of popular entertainment and art. In the nineteenth and early twentieth centuries, most of the furor about sexually explicit and other objectionable expression revolved around printed materials and live performances. But with the development of new technologies, recorded music, radio, film, television, and the Internet also became targets.

In 1930, the Hays Production Code governing the content of studio movies was introduced; it was replaced with the current Motion Picture Association of America movie rating system in 1968. As was the case during World War I, materials considered politically subversive, as well as those considered obscene, drew major repression in the 1940s and 1950s. In the 1960s, comedian Lenny Bruce, known for his social satire on topics such as race, homosexuality, drugs, and the criminal justice system, was arrested and tried repeatedly for obscenity law violations. In 1978, the U.S. Supreme Court, in *FCC v. Pacifica Foundation*, ruled against the broadcast of comedian George Carlin's monologue featuring "seven dirty words" that could not be aired on radio or television.

Music, too, was not safe from moral crusaders. In the Roaring Twenties, social purity advocates targeted jazz, which was seen as emblematic of an out-of-control black, urban, and youth subculture. In the 1950s, fears about rock-and-roll music defiling the innocence of youth were rife, as exemplified by complaints about Elvis "the Pelvis" Presley and his sexually suggestive dance moves. In the 1960s and 1970s, concerns revolved around allegations that songs such as "Puff the Magic Dragon" and "Yellow Submarine" promoted drug use. In the 1980s and 1990s, attention turned to punk, heavy metal, "gangster" rap, and hip-hop. In 1985, vice-presidential wife Tipper Gore and other wives of politicians and business leaders founded the Parents' Music Resource Center, which pressured record companies to put ratings or warning stickers on albums with violent or sexual content. In 1985, Jello Biafra of the controversial punk band the Dead Kennedys—known for songs critical of religion, politicians, and U.S. policy—was brought up on charges of distributing material harmful to minors: the band's "Frankenchrist" album which featured explicit art by H.R. Giger. In 1991, the rap group Two Live Crew (with their hit single "Me So Horny") were prosecuted for obscenity violations in Broward County, Florida, and later in several other states; both Biafra and Two Live Crew were eventually acquitted. With the campaigns against offensive music, creative expression became a focal point for concerns about political radicalism, anxieties about youth sexuality and drug use, and fears about black men.

This theme carried over to visual and performance art, but here religion, feminism, and homosexuality were the key areas of concern. In 1989, Dr. James Dobson of Focus on the Family held a press conference to denounce Andres Serrano's representation of a crucifix in a jar of urine, claiming it was anti-Christian. In June 1989, the Corcoran Gallery in Washington, D.C., canceled an exhibit by photographer Robert Mapplethorpe, a gay artist who died of AIDS in March 1989. Both artists had received funding through the National Endowment for the Arts (NEA). In 1990, obscenity charges were brought against the Cincinnati Contemporary Arts Center and its director for displaying the Mapplethorpe exhibit; a jury later voted for acquittal. Civil libertarians, artists, and other activists protested the attempts at censorship; numerous demonstrations took place, and in Washington, D.C., activists projected slides of Mapplethorpe's most controversial works on the side of the Corcoran building. Such work included sadomasochistic images, nude black men, religious imagery, a candid shot of a young girl with her genitals visible, and images that showed his physical deterioration as his illness progressed. Mapplethorpe's work played on the combined anxieties surrounding children and homosexuality, and his images of black men seemed tailor-made to bring out the racial insecurities of white men. Yet despite the objections of a vocal minority, Mapplethorpe was quite popular, and coffee-table books featuring his sexually explicit imagery became a staple of many middle-class living rooms.



In a crackdown on Internet-based child pornography, the FBI arrests former New York City police officer Brian Matthews on March 21, 2002. *(AP Wide World Photos)*

When a small Washington, D.C., gallery picked up the exhibition rejected by the Corcoran, some 4,000 viewers turned out the first weekend.

Conservative legislators, under pressure from the Religious Right, took up the crusade against indecent art and demanded investigation into NEA funding. The NEA, founded in 1965 to provide financial support for the arts, was mandated to consider cultural diversity in its funding decisions. In the summer of 1989, Senator Jesse Helms (R-NC) proposed a bill requiring the NEA to award funding not just on the basis of artistic merit, but also taking into account "general standards of decency and respect for the diverse beliefs and values of the American public." Later that year Congress passed legislation that barred the agency from supporting work that "may be considered obscene, including, but not limited to, depictions of sadomasochism, homoeroticism, the sexual exploitation of children, or individuals engaged in sex acts and which, taken as a whole, do not have serious literary, artistic, political, or scientific value." In 1990, NEA director John Frohnmeyer withdrew grants from four performance artists: Karen Finley, John Fleck, Holly Hughes, and Tim Miller—respectively, a feminist, a gay man, a lesbian, and a bisexual. A Los Angeles federal judge struck down the congressional decency provision as unconstitutional, but in its 1998 *NEA v. Finley* decision the U.S. Supreme Court reversed the lower court and allowed the decency provision to stand.

New Technologies, New Battles

Perhaps the most notable feature of the censorship debate at the turn of the twenty-first century was the new possibilities for sexual expression opened up by the Internet. Although the Internet was officially born in 1969, it was not until two and a half decades later that the widespread availability of electronic mail and the World Wide Web extended cyberspace beyond university laboratories and into millions of homes. Internet pornography became an issue in the mid-1990s in part as a result of a sensationalistic 1995 *Time* magazine cover article based on a later largely discredited study by Marty Rimm about the extent of sexually explicit material available online. The first attempt to censor the Internet was the 1996 Communications Decency Act (CDA), which made it illegal to transmit indecent or patently offensive material. Challenged by the ACLU and a coalition of plaintiffs in *Reno v. ACLU,* the CDA was struck down by the U.S. Supreme Court in June 1997. The plaintiffs—including several LGBT, AIDS, and sex education organizations as well as civil libertarian groups such as the Electronic Frontier Foundation—successfully argued that "indecency" and "offensiveness" were too vague, that valuable sexually explicit but nonobscene material would be restricted, and that adults would be limited to materials suitable for children. In the years to follow, Congress passed more narrowly tailored laws, hoping to find one that would pass constitutional muster. The 1998 Child Online Protection Act (COPA), which requires age verification measures to prevent the transmission of sexually explicit material to minors, was halted by the Supreme Court in May 2002. The similarly named Children's Internet Protection Act of 2000, which requires that public libraries and schools install filters on computers to prevent access to sexually explicit content or face the loss of federal funding, was ruled unconstitutional by a district court in 2002, but was upheld by the Supreme Court in June 2003. As use of the Internet continues to grow, online pornography remains a contentious issue.

The New Culture War: The Rise of the Religious Right

The Meese Commission hearings and the NEA furor were a microcosm of what conservative candidate Patrick J. Buchanan, speaking at the 1992 Republican National Convention, dubbed the "culture war." The culture war was a backlash against the increasing social liberalization and gains made by feminists, gay people, and ethnic and racial minorities in the 1960s and 1970s. Proponents of this agenda came to be called the New Right or the Religious Right. The beginning of the war can perhaps be dated to Anita Bryant's 1977 Save Our Children campaign, which resulted in Dade County, Florida, voters repealing a gay antidiscrimination ordinance. The Dade campaign was soon followed by California's 1978 Briggs Initiative, which sought to prohibit gay men and lesbians from teaching in public schools. Moral concerns moved from the fringes to the center of public debate, and with the election of Reagan in 1980 the Religious Right became a major force in American politics. Key New Right leaders included Donald Wildmon's American Family Association, Pat Robertson's Christian Coalition, Beverly and Tim LaHaye's Concerned Women for America, Dobson's Family Research Council and Focus on the Family, Jerry Falwell's Moral Majority, and Louis Sheldon's Traditional Values Coalition. The membership of these groups was largely made up of fundamentalist or "born-again" Protestants, and their support was particularly strong in the southern Bible Belt.

The primary targets of the Religious Right included feminism, homosexuality, abortion, sexually explicit popular entertainment and art, sex education, and school prayer. Cultural changes associated with immigrants and racial and ethnic minorities were also a concern, but some conservative African-American and Latino religious and political leaders were drawn into the movement. The central message was the need to restore "traditional family values"—that is, to reverse recent changes in family structure, conventional gender roles, and sex hierarchies. An underlying message of the New Right was that the culture wars were largely responsible for many of the problems of American society. Some of the new wave of moral reformers began their careers in the successful campaign to prevent the passage of the Equal Rights Amendment. The movement placed much importance on "traditional" marriage and the nuclear family—arguing that premarital sex, nonmarital partnerships, and same-sex marriages would undermine these institutions. Under pressure from the Religious Right, in 1996 Congress passed the Defense of Marriage Act (DOMA), which for the first time instituted a federal definition of a marriage as a "legal union between one man and one woman as husband and wife." Homosexuality—seen by social conservatives as an assault on religion, the family, and traditional gender roles—increasingly became a target of moral crusaders as the LGBT movement grew in numbers and political influence.

Protecting Children

By the 1980s and 1990s, the political climate had shifted appreciably to the right. Social conservatives demanded an end to sex education that actually educated about sex, and pushed for laws giving parents greater control over their children. Abstinence-only sex education in schools became a primary focus. The 1981 Adolescent Family Life Program was a federal effort to promote teen chastity. In 1994, the Religious Right prompted then-president Bill Clinton to dismiss Surgeon General Joycelyn Elders for suggesting that information about masturbation should be included as part of sex education. In 1996, as part of a major welfare reform law, Congress authorized funding for programs that exclusively teach the "social, psychological, and health gains" of abstinence. In 2002, the United States—in alliance with the Vatican and several Islamic countries—was instrumental in modifying United Nations treaties concerning the rights of women and children to remove provisions related to abortion, contraception, and sex education.

Yet even as social conservatives spoke of the importance of families and children, political conservatives opposed public funding for education, child care, and healthcare. Federal welfare funding was dramatically cut, and efforts were made to tie benefits to marriage; several states proposed measures to reduce benefits to women who had additional children while receiving welfare. Notably, laws increasingly required poor women to work full-time jobs; it was middle-class, white women who were being pushed back into the home.

Child Sexual Abuse Panics

The 1980s and 1990s were characterized by fears about pedophilia, sexual abuse by strangers and homosexuals, and child pornography. Sexual abuse of children is widespread, but it is most often committed by family members or acquaintances of the children, and the majority is by men against girls. Yet while intrafamily abuse remains largely unspoken, fears about the "other" and the "outsider" are loud and clear. Pedophiles became the most demonized target

in late-twentieth-century America. They remain the one group that even the most ardent proponents of civil and sexual liberties are loath to defend. Penalties for child sexual abuse or statutory rape were increased dramatically during this period, including "Megan's laws" (named after murder victim Megan Kanka), sex offender registries, and proposals for indefinite confinement in mental institutions after the completion of prison sentences. The furor over pedophilia came to a head in 2002 when a large number of Catholic priests were accused and convicted of sexual abuse and their superiors were charged with a cover-up; in response, some Church leaders blamed the scandal on homosexuals within their ranks. Unlike the case in many previous child panics in which rumor swirled without foundation, there was real evidence that inappropriate sexual conduct by priests was a widespread problem.

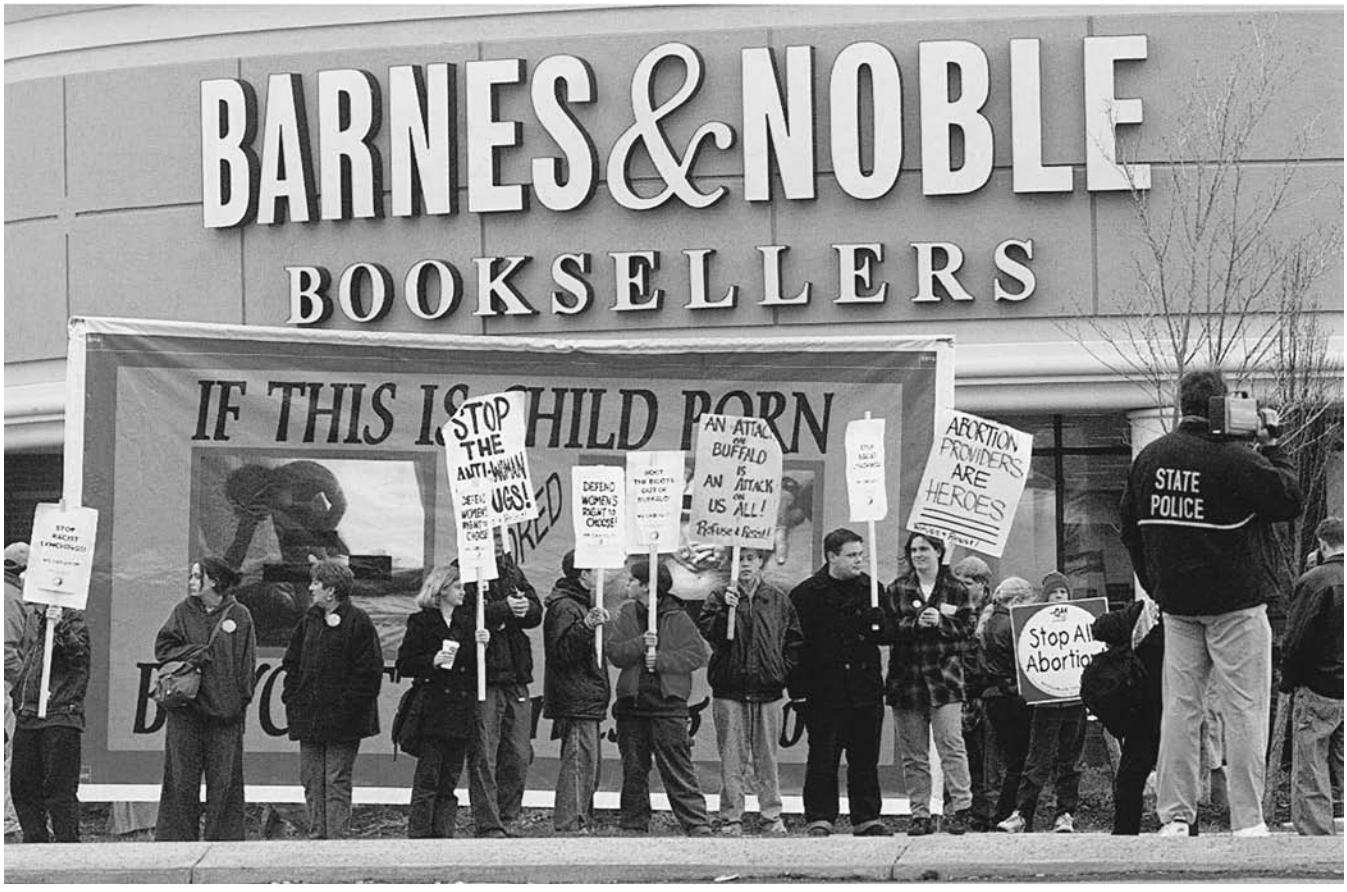
One of most extreme manifestations of the child sex panic concerned the McMartin preschool in Manhattan Beach, California, near Los Angeles. In 1983, a parent complained to police that her son had been molested at the school, which was run by Peggy Buckey and Virginia McMartin and employed Raymond Buckey as an aide. After the local police chief sent letters to parents warning that their children may have been abused, a media frenzy ensued. Hundreds of children were interviewed by the Children's Institute International, and by 1984 over 300 had been identified as victims and some 100 staff had been accused. The investigation was marked by interview techniques that allegedly coached children about what to say and rewarded them for desired responses. Upon investigation, minimal physical evidence for these charges was found. Although the case was one of the longest and most expensive criminal trials in U.S. history, most charges were dropped. In 1990, Peggy Buckey was cleared by a jury, and two juries deadlocked on charges against Raymond Buckey.

An important feature of the McMartin case—and one that marks it as a classic panic—is how many people believed the allegations and joined in the calls for vengeance, no matter how bizarre the accusations or how little evidence there was to support them. A 1994 U.S. government report analyzing over 12,000 accusations of Satanic ritual abuse in this and other cases found "not a single case where there was clear corroborating evidence." The McMartin case joins the Salem witch trials and the McCarthy-era red scare as a major example of mass hysteria. One outcome of this panic was a generalized suspicion concerning adult men and children.

Child Pornography

Child pornography has never been as prevalent as opponents have claimed, and much of what has been available was provided through the government as part of various entrapment operations such as the FBI's "Innocent Images." Still, with increased access to pornography through the Internet, the opposition to child pornography escalated to such an extent that images not intended as pornography were sometimes targeted. Laws and corporate policies were put into place requiring commercial photo developers to report suspect material. In 1990, police and the FBI raided the San Francisco home of Jock Sturges, a fine art photographer whose work includes nude images of minors; although Sturges was never indicted, he was accused in the media of being a child pornographer. Throughout the decade, reports periodically surfaced of parents being reported to authorities for developing nonsexual nude photos of their own babies and young children.

In 1977, Congress passed the Sexual Exploitation of Children Act, which prohibits the use of minors in the making of pornography, taking pornographic pictures of minors, and interstate transactions involving child pornography. The 1982 *New York v. Ferber* U.S. Supreme Court decision set a new standard for child pornography, permitting greater restrictions of sexual material involving children and essentially waiving the three-prong *Miller* test for child pornography. The Child Sexual Abuse and Pornography Act of 1986 banned advertisements for child pornography and raised minimum sentences for repeat offenders. With the explosion of the Internet, child pornography—much of it produced and distributed from outside the United States—became more widely available, including unsolicited "spam" mailings to unsuspecting recipients. The 1988 Child Protection and Obscenity Enforcement Act prohibited transmission of child pornography using a computer. In 1990, Congress made it illegal to possess three or more pieces of child pornography obtained through interstate or foreign commerce or via computer. And in 1996, Congress passed the Child Pornography Prevention Act (CPPA), which prohibited "virtual" child pornography—computer-generated images of children or images in which adults are made to look like children. In April 2002, the U.S. Supreme Court ruled in *Ashcroft v. Free Speech Coalition* that the CPPA was overbroad and unconstitutional, but legislators soon introduced a new law, the Child Obscenity and Pornography Prevention Act (COPPA), in an attempt to circumvent the ruling. In



On April 19, 1999, picketers in East Amherst, New York, demonstrate at a Barnes & Noble bookstore that sold books depicting nude children by photographers Jock Sturges and David Hamilton. Picketers were divided fairly evenly between supporters and opponents. *(AP Wide World Photos)*

April 2003, Congress passed the PROTECT Act, which included the proposed COPPA provision banning digitally morphed sexual images of children, as well as a prohibition against misleading Internet domain names that could direct children to pornographic Web sites.

AIDS and Its Impact

The late 1980s and 1990s were a time of increasing visibility for gay men and lesbians, and later for bisexual and transgender people. Several gay rights and antidiscrimination laws had been passed, the federal government began to pay attention to AIDS after nearly a decade of neglect, and the 1987 March on Washington demonstrated the burgeoning movement's growing political strength. One outcome of the march was the birth of the AIDS Coalition to Unleash Power (ACT UP), followed in 1990 by Queer Nation. The upsurge in LGBT activism was spurred in part by outrage over the U.S. Supreme Court's 1986 *Bowers v. Hardwick* ruling, which upheld a conviction under Georgia's sodomy law of two gay men for having sex in their home. Although many states had abolished their sodomy laws in the sexually liberal 1960s and 1970s, at the turn of the century a dozen states still retained laws prohibiting oral and anal sex—some targeting same-sex activity only and others encompassing everyone, including married heterosexual couples. Although sodomy laws are not often enforced, they sometimes come into play in child custody, statutory rape, and prostitution cases. Arguing that they are discriminatory, gay rights advocates have had some success in overturning sodomy laws that ban sexual activity between same-sex but not opposite-sex partners. The LGBT rights movement also achieved a major victory with the U.S. Supreme Court's 1996 *Romer v. Evans* decision, which declared that a state could not prohibit local sexual orientation antidiscrimination laws.

The moral crusade of the 1980s and 1990s cannot

be understood without taking into account the impact of AIDS, which first came to public attention in 1981. Jerry Falwell and other leaders of the Religious Right began to equate AIDS with homosexuality, prostitution, and drug use in the mid-1980s, contending that AIDS was a punishment for immoral behavior. The New Right associated it with crime, diseases, and mental illness. In 1987, Helms proposed an amendment—which came to be known as "no promo homo"—that prohibited the use of federal funds for HIV/AIDS education or prevention materials and activities that "promote, encourage, or condone, directly or indirectly, homosexual activities or intravenous use of illegal drugs." "No promo homo" rested on the idea that promotion of immorality was more dangerous to society than the transmission of a deadly disease.

AIDS has had a profound effect on gay identity and sexual practices. The language of AIDS would serve as a battleground for a decade of culture wars surrounding sex. ACT UP's slogan was "Silence Equals Death." One of the lessons of the AIDS crisis was that speech and identity are intimately entwined. AIDS has been used to reinforce the old idea—prominent in the crusade against prostitution in the mid- and late 1880s—that sexual deviation leads to disease and death. In the words of Gayle Rubin in her essay "Thinking Sex" (1984), "The history of panic that has accompanied new epidemics, and of the casualties incurred by their scapegoating, should make everyone pause and consider with extreme skepticism any attempts to justify antigay policy initiatives on the basis of AIDS."

Gay Sex Panics

Although the increased visibility and political clout of the LGBT community curtailed police raids on gay bars and cruising spaces relative to their levels in the 1940s through the 1960s, increased uncertainty about gender roles, anxieties about unrestrained sexual expression, and fear of AIDS ushered in new gay sex panics in the 1980s and 1990s. But unlike panics of the past, this round often pitted members of the LGBT community against one another.

San Francisco faced a major battle over gay bathhouses in the early 1980s. Although many such establishments had gone out of business as a result of a decline in clientele as the AIDS epidemic spread, Mayor Dianne Feinstein was determined to close those that remained. The attempt brought about an intracommunity struggle that resembled the "sex wars" taking place at the same time. Some gay men saw bathhouses as a symbol of newly won gay liberation and vociferously opposed their closure. Other, more "respectable," gay men were quick to dissociate themselves from those who were more promiscuous and overtly sexual. LGBT leaders and public health officials were genuinely concerned about the massive illness and death affecting their community and were willing to sacrifice some sexual liberties to stop it. In October 1984, health department director Dr. Mervyn Silverman issued an emergency order closing the baths.

A similar struggle once again came to the fore in the mid-1990s. In a quirk of regulatory bureaucracy, San Francisco had banned bathhouses with private rooms while allowing sex clubs where men could engage in sexual activity in public common spaces. In the fall of 1996, the Coalition for Healthy Sex—a group of local sex club proprietors, sex educators, AIDS activists, and public health workers—proposed a set of standards they hoped would make for a safer sex club experience; these included mandating condoms and HIV education materials and restricting locked private spaces that could not be monitored. Despite opposition, the Department of Public Health implemented the regulations in early 1997. Opponents of the standards—who also included sex club proprietors and AIDS activists—formed a group called Community United for Sexual Privacy to attempt to have the guidelines thrown out. They argued that gay men have a right to privacy in commercial sex venues and that such spaces are ideal locations for AIDS prevention efforts. By 1999, a local gay Democratic club, the city's Human Rights Commission, and the city's HIV Prevention Planning Council voted to withdraw the guidelines; these votes were not binding, however, and the city's health department declined to rescind the regulations. The furor then died down as quickly as it had started.

New York City had a different experience. In that city, bathhouses with private spaces were not banned, but city health regulations prohibited sex—with or without condoms—in public establishments. Here again, debate about public sex spaces divided the LGBT community. A group called Gay and Lesbian HIV Prevention Activists pressed the city to more strongly enforce its ban on sex in commercial venues. Well-known gay authors such as Michelangelo Signorile and Gabriel Rotello called for gay men to be less promiscuous, suggesting that monogamous long-term relationships were key to preventing HIV transmission.

The Battle for Public Space

The debate over gay sex venues in New York City took place against the backdrop of a more general battle over public space. In the mid-1990s, the city undertook an effort to "clean up" Times Square, the blocks surrounding Manhattan's theater district and the Port Authority bus terminal, which had become an infamous center of low-budget sexual entertainment. The city hoped to bring money into its coffers by making the district more attractive to corporations, wealthy residents, and middle-class family-oriented tourists—as exemplified by Disney chairman Michael Eisner's renovation of the New Amsterdam Theater as a venue for Broadway versions of Disney children's movies. In exchange for his investment, Eisner called on the city to get rid of the surrounding X-rated theaters, strip clubs, and adult stores. Although begun under Democratic mayor David Dinkins, the Times Square cleanup became the cornerstone of Republican mayor Rudolph Giuliani's citywide "quality of life" campaign, which targeted the homeless, panhandlers, honking drivers, protesters without permits, unauthorized gatherings, and the punk, transgender, LGBT, and racial and ethnic minority youth who populated the city's public spaces.

In 1995, the New York City Council passed amendments to the city's existing zoning law intended to eliminate commercial sex establishments. The new law targeted businesses that had a "substantial portion" of their stock devoted to sexual merchandise. Although most of the targeted venues catered to heterosexual men, the law was so vague that opponents feared gay-oriented book and novelty stores could fall within its purview. In addition, no adult businesses could be located within 500 feet of a church, a school, a residential district, or another such business. (Similar laws are in place throughout the United States to restrict adult business, but in Manhattan nearly everything is within 500 feet of a school, a church, or a residence.) In order to pass constitutional muster, the city would have to prove that adult businesses could relocate to other areas, and also that they were clearly linked to negative "secondary effects" such as crime—a link the Meese Commission was never able to establish.

New York City mayor Giuliani argued that commercial sex establishments hurt other business and eroded public morality in the city. Some opponents accused the mayor of generating a sex panic, claiming the plan was a real estate land grab cloaked in the guise of a moral campaign. The zoning law engendered debate about cultural diversity and the nature of the public sphere. While some activists were more concerned about what was being lost, others were more angry about what would take its place. Immediately after the zoning law passed, Harold Price Ferringer, former attorney for Larry Flynt, the self-styled smut peddler, challenged its constitutionality. In 1999, the U.S. Supreme Court rejected Ferringer's final appeal, but by then the law had already been implemented. Even in the aftermath of September 11, 2001, the New York City Council took time to pass additional amendments to the zoning code aimed at further restricting public spaces for erotic performance and merchandise (which were ruled unconstitutional in September 2003).

Into the Twenty-first Century

At the turn of the twenty-first century, social conservatives appeared to have lost much of its previous influence. Falwell was ridiculed in 1999 when he complained that Tinky Winky, a children's television character, was gay. Ridicule turned to outrage when he suggested—and Pat Robertson agreed—that pagans, abortionists, feminists, gays and lesbians, and civil liberties activists were to blame for the September 11 terrorist attacks.

The attempted impeachment of Bill Clinton following revelations of his extramarital affair with a White House intern was perhaps one of the last major shows of strength by the Religious Right. Clinton's "permissive" attitudes and unseemly behavior came to symbolize everything wrong with liberal America. Republican leaders, Religious Right spokespersons, and the media spent months dwelling on every detail of "Monicagate," but the public seemed to soon tire of the issue. Unlike preceding Republican administrations, the Religious Right did not play a major role in the election of George W. Bush, who was more closely aligned with business interests (although Ashcroft's ascendance as attorney general exemplified the Religious Right's continuing influence).

Just as the moral crusade of the 1980s and 1990s reflected a backlash against the liberalization of the 1960s and 1970s—which was itself a reaction to the conservativism of the 1950s—by the end of the century the tide again appeared to be turning. Increasing numbers of lesbian, gay, bisexual, and transgender people "came out of the closet," and demonization does not work as well when an enemy is known and stereotypes are shown to be wrong. The adoption of domestic partner legislation or policies by many local and state governments and corporations, and the introduction of civil unions that closely approximate

marriage, have led some to predict that same-sex marriage may be a reality by the end of the decade (despite stepped-up efforts to amend the Constitution to define marriage as including only one man and one woman).

Still, throughout the past decade, state sodomy laws were steadily overturned. Most notably, in June 2003 the U.S. Supreme Court ruled against a Texas sodomy law that banned oral and anal sex between same-sex but not opposite-sex partners, overturning its 1986 *Bowers v. Hardwick* decision. In the majority opinion in *Lawrence and Garner v. Texas,* Justice Anthony Kennedy wrote that it is unconstitutional to single out homosexuals for moral disapproval, and that "[t]he state cannot demean their existence or control their destiny by making their private sexual conduct a crime." Recognizing the broad implications of the ruling, which invalidates the thirteen remaining state sodomy laws against both same-sex and opposite-sex sexual conduct, dissenting justice Antonin Scalia asserted that the court had "taken sides in the culture war" and "largely signed on to the so-called homosexual agenda."

On the whole, compared to the War on Drugs, recent moral crusades against stigmatized sexual behavior and expression have generated more sound than fury. Crackdowns against prostitution and gay male cruising still happen with some regularity, but sentences do not approach those for drug infractions.

But this was before September 11, 2001, and subsequent wars in Afghanistan and Iraq. Social panics have always been used to erode opposition to hitherto unacceptable impositions on civil liberties. Following the terrorist attacks, this tendency was exemplified by the efforts of the Bush administration, led by Attorney General John Ashcroft, to institute control of immigrants (especially Arabs and Muslims) and surveillance of citizens that previously would have been untenable. However, the laws put into place since 2001 have for the most part focused on security rather than smut. In the months after September 11, images of an epic battle between good and evil once again were called forth, but this time—as happened during previous times of war—the focus was on foreigners, immigrants, and political dissidents rather than on sex, drugs, and rock-and-roll.

Conclusion

Social purity movements in the United States reflect a paradox inherent to American society: the country was born with a strong Puritan streak, but also has traditionally espoused the values of liberty and privacy. It is therefore not surprising that social movements reflect these conflicting elements. The anti-vice activism of the late nineteenth century combined the progressive drive for social reform with the evangelical hope of making America a religious country. Despite their often-coercive methods, many early efforts to eliminate vice anticipated Progressive Era reforms in the areas of labor law, food and drug regulation, hygiene improvements, and better healthcare for immigrants. In both the social reform movements of the nineteenth century and the anti-pornography activism of the 1980s, some feminists made alliances with religious leaders and other conservative forces. Concerning women's rights, sexual equality, and the structure of the family. Feminists have repeatedly found themselves split between those promoting greater protection for women and social control of men, and those seeking greater autonomy and self-determination for women. Similar tensions have also been evident in movements for the rights of children, people of color, immigrants, and the poor.

Anti-vice movements and intervening periods of liberalization reflect the ongoing battle between the values of Puritanism and liberty. On the whole, mainstream America is a society of moderates, favoring a "live and let live" attitude. Yet periodically—especially during periods of social upheaval—a minority of "true believers" (religious crusaders, hard-core drug warriors, and the like) is able to sway a majority of fed-up moderates and the opportunistic politicians that surround them. During the late 1800s and early 1900s, moderates were mobilized against the excesses of saloon culture, aided by the increased xenophobia of World War I, leading to Prohibition. The social changes brought about by World War II spurred the political and moral panics that set the stage for the McCarthy witch hunts. And fears about societal breakdown in the wake of the cultural liberalization of the 1960s and 1970s ushered in the social conservative "traditional values" campaigns. Moral panics have been most successful in areas in which the mainstream perceives concrete societal harm, especially harm to children.

Loud moral crusades often give the appearance of deeper sentiment than actually exists. Despite their best efforts, social purity proponents have never been able to do away with the demand for alcohol, drugs, prostitution, sexually explicit materials, or contraception—which the market has always found a way to supply. When the pendulum swings too far in the direction of moral purity, mainstream sentiment again pushes toward moderation. As demonstrated with

Prohibition, the typical American has an interest in curbing excess, but not in allowing the state or the church to police his or her own behavior.

Prostitution Reform

Vice and prostitution were considered a permanent feature of American life for much of the eighteenth and early nineteenth centuries. In some parts of the West during the frontier and Gold Rush days, prostitution was widely accepted, and prominent madams played an active role in many a town's social scene. But changes in the structure of the American family and society during the mid-nineteenth century created a shift in social understandings. As early industrialization drove women's work outside the home, women's roles in traditional domestic economies began to change. Commercialization altered both families and social networks. Some women became wage earners, while others became social reformers. Outside of domestic private spaces, discrimination and exploitation marked women's work experiences. Far from family and community, there was no redress for labor-management problems. Pregnancy outside of marriage was condemned, and many women turned to prostitution as a means of survival. Industrialization intensified the shifts in family life, contributing to the rise in prostitution and calls for social reform. Concurrently, some of the same societal changes that drove working-class women into the labor force provided upper- and middle-class women the leisure time to focus their attention beyond the domestic sphere; these women came to play a major role in the century's social reform movements.

The Anti-Prostitution Movement

The first wave of anti-prostitution reform in the United States, as in Britain, conceived of prostitution as a social problem of public health and morality, with female polluters and male victims. The year 1864 saw the passage of the British Contagious Diseases Act, a law aimed at controlling venereal disease. Paradoxically, the same social purists who saw women as the victims of male lust offered a solution that punished women by sanctioning the state to examine and inspect those accused of prostitution. Opponents of the new laws—a coalition of feminists, radical working-class men, and evangelists—fought the legislation on the grounds that it sacrificed female liberties while supporting state-sanctioned rape. Reflecting social fears about immigration and racial diversity, the first anti-prostitution laws in San Francisco in the mid-nineteenth century were aimed at controlling Chinese prostitutes.

Not all reform efforts were aimed at punishing "fallen" women. In the mid-1800s, groups such as the Providence Association for Employment of Women, the New York Moral Reform Society, and the Boston Society for Employing the Poor worked to raise women's wages so that they would not be forced to turn to prostitution. So-called Magdalene Societies sought to rehabilitate prostitutes and discourage male lust; some favored "anti-seduction" laws to prevent men's exploitation of vulnerable women. But many U.S. prostitution abolitionists followed the British model, describing prostitutes as "malevolent, cruel, and vengeful women" who were thought to corrupt their male victims. Men rarely were arrested or incarcerated for their involvement with prostitutes. The double standard of punishing women for providing a service that men sought and paid for thus became an issue with which feminists would grapple well into the next century. Women's rights were rarely the driving force behind anti-vice campaigns.

Early 1900s Reform

"Ladies . . . Dante is dead . . . and I think it's time we dropped the study of his inferno and turned our attention to our own," Sara Decker, the president of the General Federation of Women's Clubs, urged members in 1904. The General Federation of Women's Clubs won a federal charter in 1901, thus sparking an exodus of middle-class women from the private do-

mestic sphere of the home into the public sphere of the broader world with its various "social evils."

The second wave of prostitution reform in the United States was set between a coalition of abolitionists and social purity advocates who defined prostitution in moral terms, and reformers who defined prostitution in functional terms as a social necessity (or inevitability) that should be regulated to prevent disease and the exploitation of women. While conservative social purity advocates opposed women's suffrage, employment, and education—instead focusing on male depravity—more socially progressive feminists argued that such an agenda had little to do with feminism. As the social purity movement and Victorian mores intersected, reformers called for a change not of men's hearts, but of the nation's laws. Although it was appealing to call for reform of male sexual urges—which some conservatives and radicals alike suggested turned women into "prostitutes" at home—others felt that legal remedies were the best solution.

Prostitution and Public Space

To the extent that prostitution was defined in terms of public health, morality, and public space, the voices of those who argued for its abolition persisted. In 1911, in Hartford, Connecticut, for example, a group of suffragists attacked the "social necessity" argument for prostitution, challenging a core ideology of public space that allowed prostitution to thrive in cities across the country. They understood that vice districts existed within the contradictions of the nineteenth-century ideology of separate spheres for middle-class women and men, under which virtuous women were thought to belong within the private domestic sphere of the home while men belonged in the more dangerous terrain of public spaces. The public arena was thought to be an immoral space equated with evil and sin, while the private sphere was equated with goodness, chastity, and safety. Feminists challenged this ideology. In doing so, they called for closing brothels and fighting prostitution within the city's public spaces as part of their struggle for women's access to and safety within these spaces. Many states passed laws against vagrancy and bawdy houses in the early 1900s, and in the World War I era, a majority of the country's brothels were shut down. Yet as reformers succeeded in shutting down vice districts and houses of ill repute, prostitution instead dispersed throughout cities, producing new institutions within the commercial sex economy. In the end, the public sphere was no more purified. It is notable that the very neighborhood street prostitution that spurs the most complaints today is a result of closing brothels and launching crackdowns on red-light districts.

Other social reformers focused on so-called white slavery—the capturing or selling of "innocent" white women into prostitution or sexual slavery—which was the subject of considerable moral panic but never proven to exist on a wide scale. Again, concerns about prostitution reflected fears about immigration, racial and ethnic differences, urbanization, industrialization, and the entry of women into the workforce, often under deplorable conditions. Just as the temperance movement was able to propel the eventual passage of national alcohol prohibition, women's agitation around prostitution created momentum toward the passage of the 1910 Mann Act, better known as the White Slave Traffic Act. Debate about prostitution led to a massing of information on the subject, which helped propel trade and wage reforms. In many respects, the temperance movement laid the groundwork for reforms witnessed during the Progressive Era.

As Emma Goldman outlined in her essay, "The Traffic in Women" (1917), the link between sweatshop conditions and easy recruitment into the black market economy became a visceral reality that few could deny. Goldman's was a critique of marriage and patriarchy within the capitalist social framework. Goldman saw marriage as no less a form of prostitution than street solicitation for women who had no other options for work. Given the lack of vocational opportunities for women, Goldman said, it is:

> inevitable that she would pay for her right to exist, to keep a position in whatever line, with sex favors. Thus it is merely a degree whether she sells herself to one man, in or out of marriage, or to many men. Whether our reformers admit it or not, the economic and social inferiority of women is responsible for prostitution.

Goldman noted that sweatshop workers received $6 per week, or an average wage of $280 per year. Under such conditions, Goldman asked, why would anyone be surprised at the rise of prostitution? Thus, prostitution could be viewed as "the direct result, in many cases, of insufficient compensation of honest labor" and functioned as the only way out of a second-class life as a sweatshop worker, a mistress, or a servant. As such, Goldman called for workers' solidarity with prostitutes.

The Sex Worker Movement

Although prostitutes' spaces could be shut down, the practice (and the market demand for it) rarely disappeared. Attacks on prostitutes as threats to public space, morality, and health would remain a long-term fixture of discourses on prostitution. Today, Nevada is the only state that permits legal prostitution in certain counties. In the latter years of the twentieth century, the right of women in the sex industry to earn their living as they saw fit was a major area of contention. Sex worker activists and groups such as Call Off Your Old Tired Ethics (COYOTE) and Prostitutes of New York (PONY)—run by sex workers themselves rather than by outside reformers—demanded self-determination for women and men in the sex industry and spoke out against laws that penalize sex workers. The issue of sex work became one of the arenas of the feminist "sex wars" of the late 1970s and early 1980s. The spread of AIDS in the 1980s and 1990s led to many laws restricting prostitution and punishing HIV-positive prostitutes, but at the same time had the effect of galvanizing prostitutes' rights activism and led to the development of many harm reduction and safer sex education programs for sex workers.

Recalling the anti-prostitution crusade of the early 1900s, by the turn of the twentieth century trafficking in women and children had again become a major focus of the campaign against the sex industry. Increased globalization allowed people to move more freely across international borders, but the attendant economic dislocation made it more likely that women and children would enter prostitution for lack of other options. Some feminists and social reformers defined prostitution as inherently exploitative and called for the abolition of the sex industry rather than improving its conditions. Like the Magdalene Societies, abolitionists dedicated themselves to rescuing women from the sex industry and helping them to find other employment—rarely acknowledging that the garment industry, domestic labor, and other available alternatives could be equally problematic. Whereas organizations such as Women Hurt in Systems of Prostitution Engaged in Revolt (WHISPER) oppose the legitimization of prostitution, liberationist sex worker activists focus on improving working conditions, reducing legal persecution, and instituting harm reduction measures. An important victory for the sex worker rights movement was the establishment in 1996 of the first closed-shop sex worker union, the Exotic Dancer's Union, at San Francisco's Lusty Lady peepshow.

Today the issue of prostitution—especially on a global scale—remains contentious. Reformers who wish to abolish prostitution and those who seek to improve working conditions and eliminate social stigma against sex workers remain at odds. But having evolved past the stage of seemingly glorified sex work as an expression of women's sexual autonomy, prostitutes' rights activists increasingly acknowledge the negative effects of sex work in certain social contexts and focus on the distinction between those who choose a career in sex work and those who are forced into prostitution, whether by threats and violence or due to the lack of viable economic alternatives.

Early Anti-Vice Campaigns

After the Civil War, as young men arrived in cities away from family influences, reformers feared they would fall prey to urban vices. Pervasive municipal corruption and the persistent presence of increasingly popular gambling dens, brothels, and saloons left many New Yorkers convinced that the time had come to contend with the social evil of sexual commerce.

One of the most well-known opponents of prostitution and obscenity was Anthony Comstock. Working with a group of reformers including Charles Parkhurst, Comstock organized a group of preventive societies, the most famous of which was the Society for the Suppression of Vice. Comstock and fellow anti-vice crusaders saw connections between various vices such as alcohol, prostitution, and sexually explicit materials. In Comstock's major treatise *Traps for the Young* (1883), he described lust as:

> the boon companion of all other crimes. There is no evil so extensive, none doing more to destroy the institutions of free America. It sets aside the laws of God and morality; marriage bonds are broken, most sacred ties severed, State laws ignored, and dens of infamy plant themselves in almost every community and then, reaching out like immense cuttlefish, draw in, from all sides, our youth to destruction.

Comstock successfully lobbied for the passage in 1873 of federal anti-obscenity legislation dubbed the "Comstock Law." The law prohibited the passage through the mail of "obscene, lewd, or lascivious" matter, including educational materials about venereal disease and literature or devices related to contraception or abortion. The law did not specify what was to be considered obscene; as a result, certain scientific and medical works were censored, and sex education was excluded from schools. In the years that followed, half the states in the Union passed similar laws.

Comstock's Targets

Appointed by the federal postmaster as a special agent in charge of enforcement of the 1873 law, Comstock dedicated himself to the task of investigating, researching, and prohibiting obscene materials. Although he focused on printed matter, Comstock also railed against live sexual performances, venturing into the "dens of iniquity" where live sex acts were performed for an audience. On one typical occasion, he spent some four hours witnessing, taking notes on, and describing every detail of the evening's "Busy Flea" performance in New York City. His notes described three women stripping, exposing themselves to patrons, and engaging in and mimicking various sex acts. After sitting through the entire show, Comstock announced that everyone in the house was under arrest. Comstock did not limit himself to sexually explicit performances. One of his most famous targets was Chicago belly dancer Farida Mahzar, better known as Little Egypt.

On some evenings Comstock's appearance at a brothel was greeted by the fist of an owner. One such reception sent him reeling down a flight of stairs. Yet none of this deterred the crusader.

Another victim of Comstockery was Ida Craddock, a counselor who wrote several marriage manuals with titles such as *Right Marital Living*. She argued for sexual self-control and urged men not to force sexual intercourse upon their wives. Ironically, Craddock herself was somewhat of a moral purist, opposing prostitution, masturbation, and contraception. Craddock was imprisoned in 1902 under New York City's anti-obscenity law. Arrested again under the federal Comstock Law soon after her release, she committed suicide rather than face another prison term.

But perhaps the best-known target of Comstock's efforts was birth control advocate Margaret Sanger. Sanger, a nurse, wrote a birth control pamphlet titled *What Every Girl Should Know* in 1916 and opened the first family planning clinic in Brooklyn, New York,

COMSTOCK, ANTHONY (1844–1915)

Anthony Comstock was born in New Canaan, Connecticut. The roots of Comstock's social purity crusade, however, can be found within the social currents of post–Civil War New York City, where Comstock settled after serving as a Union soldier. The roots of Anthony Comstock's social purity crusade can be found within the social currents of post–Civil War New York City, where Comstock settled after his years as a Union soldier.

An early supporter of the notion that prostitution and obscenity presented a grave threat to America's youth, Comstock, along with other anti-vice campaigners, established a crusade to battle the sins of indulgence in alcohol, prostitution, and obscene materials—from pornography to information about birth control. Together, they organized various preventive societies, including the Society for the Suppression of Vice, which Comstock remained secretary of until his death in 1915.

While advocacy groups of the time debated the pros and cons of legalizing prostitution, Comstock aimed to shift American morals and values. Within Comstock's purview, any visual material or literature related to sexuality that was not observed in a museum was conflated with obscenity. His views also exemplified the connection many reformers saw between various vices. For Comstock, alcohol led to alcoholism, which combined with lust resulted in venereal disease, which in turn contributed to further corruption. In his major treatise *Traps for the Young* (1883), he equates lust with criminality.

According to Comstock, young males were more susceptible to the traps associated with the intoxicating matrix of prostitution, drink, and gambling than young women—whom he also considered more expendable. In Comstock's eyes, the very existence of prostitution and drink blighted American manhood, thus presenting a threat to the country's future.

Comstock authored the 1868 New York State statute forbidding immoral works. But he did not stop there. By 1873, Comstock had successfully lobbied for passage of federal anti-obscenity legislation—dubbed the "Comstock Law"—with the backing of the Young Men's Christian Association (YMCA). Subsequently, the postmaster general named Comstock a special agent charged with enforcement of this law, which prohibited the passage of sexually explicit matter through the U.S. postal system.

Over the next forty years, Comstock actively researched and condemned materials that he judged to be smut or filth. In addition to addressing more blatant examples of obscenity, Comstock's efforts targeted such writers as Ida Craddock, who wrote several books that dealt with issues of marital sex. Beyond his focus on examples of "sexual depravity" in print and the arts, Comstock also sought to eliminate live sexual performances of all kinds, as well as what he considered "lewd" dancing, repress all materials and efforts related to birth control, and expose various fraudulent practices and advertisements.

Over the years, Comstock's name became synonymous with the recurring American fixation on moral regulation and sexual suppression. In 1905, after Comstock denounced George Bernard Shaw for the play *Mrs. Warren's Profession*, Shaw termed his standards for decency in art and the distinctive national tendency they represented "Comstockery."

Benjamin Shepard

that year. Soon thereafter, Sanger and two colleagues were arrested under the same New York anti-obscenity law that had ensnared Craddock. Sanger's imprisonment brought greater attention to both contraception and anti-obscenity legislation.

Cultural Anxiety

The subtext of much of the Comstock crusade and the anti-vice movement at large played on cultural anxieties about the growing political power of immigrants and broader threats to the social and political positions of the upper and middle classes. Contraception threatened social hierarchies by giving women the opportunity to leave the domestic sphere of the home and gain autonomy from men, and also aroused white Anglo-Saxon Protestant fears of being overwhelmed by immigrant populations that tended to have many children. The anti-vice movement was most successful when it linked fears about the moral corruption of youth to changes in gender roles and social and economic hierarchies. Often, repression of vice functioned as a cover for opposition to shifts in class and racial hierarchies.

Many of the early attacks on explicit materials, brothels, and other aspects of sexual commerce followed labor unrest in New York City. Sexual libertinism coincided with a burgeoning Anarchist and Socialist labor coalition driving for political and economic power in the city. Anti-vice campaigns closely matched attempts to break strikes and Socialist organ-

izing efforts throughout the 1870s. However, all the while, each brothel that was closed seemed to reopen somewhere else, in another tenement within the city.

Comstock's core argument—that obscenity threatened children—was a powerful message. By claiming that children were endangered, the anti-vice movement gained legitimacy. These echoes continue to reverberate within current political discourse. Many of the rhetorical dynamics of Comstock's crusade against pornography, abortion, contraception, indecency in art and literature, and the corruption of children were a consistent theme throughout nineteenth- and twentieth-century moral crusades. The temperance movement of Comstock's era mobilized a powerful coalition against the use of alcohol by making the case that inebriated husbands were more likely to squander wages and to neglect and abuse their children. Later, anti-abortion activists deployed arguments about the protection of children in their campaign for parental consent laws that mandate control over teenage girls. Similarly, those opposed to gay rights have used arguments that gays, lesbians, bisexuals, and transgender people recruit children as a justification for turning back antidiscrimination laws.

Resistance to Comstockery

Yet from its earliest days, Comstockery was never without its opponents. Various freethinkers, Anarchists, Socialists, and utopians sought social reform, greater civil liberties, and increased freedom for women through the loosening of oppressive moral strictures. At the height of the nineteenth-century anti-vice campaign, radical author and lawyer Lysander Spooner, in *Vices Are Not Crimes* (1875), argued that the government had no right to make laws against consensual vices that harmed no one other than the person who committed them:

> Vices are simply the errors which a man makes in his search after his own happiness. Unlike crimes, they imply no malice toward others, and no interference with their persons or property. . . . Unless this clear distinction between vices and crimes be made and recognized by the laws, there can be on earth no such thing as individual right, liberty, or property, and the corresponding and coequal rights of another man to the control of his own person and property.

Spooner's successors would continue to battle the heirs of Comstock throughout the ensuing century, encompassing efforts such as the censorship of movies under the Hays Production Code in the 1930s, the prohibition of the homosexual Mattachine Society's *ONE* magazine in the 1950s, and the banning of purportedly obscene literature throughout the first half of the twentieth century. Although the last Comstock laws were repealed in the mid-1960s, the social purity impulse has lived on, as evidenced by the religious right's "traditional values" campaign of the 1980s and more recent attempts to control sexually explicit material on the Internet.

Prohibition and Repeal

The use of alcohol in the United States dates to the founding of the country, and consumption of beer, wine, and distilled spirits was a prominent feature of colonial life. Yet since that time attempts have been made to regulate and control alcohol use. Many of the earliest efforts encouraged moderate use (the true meaning of "temperance") rather than outright prohibition and were often based on health concerns. While overt drunkenness was frowned upon, moderate consumption—especially of beer and wine—was widely regarded as acceptable, even salutary. Thus, early temperance advocates urged others to limit, or temper, their consumption of alcohol, not to necessarily abandon it altogether. Former Army Surgeon-General Dr. Benjamin Rush was one of the first to write about the harmful effects of alcohol in his 1785 *Inquiry into the Effects of Ardent Spirits Upon the Human Body and Mind*.

In the ensuing years, various Protestant religious groups—including Methodists, Presbyterians, Universalists, Baptists, and the Society of Friends—began to promote temperance, or even to demand that their members abstain entirely from alcohol. In contrast, Catholic and Jewish groups—the religions of many new immigrants—generally did not support alcohol prohibition. In part, Protestant religious groups were motivated by a general Puritan suspicion of pleasure, but in the years to come they would take up many of the societal harm arguments against alcohol put forth by feminist temperance activists and other social reformers.

In 1789, a group of farmers in Litchfield, Connecticut, formed what is thought to be the first U.S. temperance society. The Massachusetts Society for the Suppression of Intemperance, formed in 1813, agitated against gambling and "profaneness" as well as alcohol. In 1826, the American Society for the Promotion of Temperance was founded in Boston. By the 1830s, there were an estimated 6,000 temperance societies, with over one million members. Other groups included the Washingtonian Society in 1840—a group of reformed drinkers who had repudiated their old ways—the Sons of Temperance in 1842, and the Independent Order of Good Templars in 1852.

During the first half of the nineteenth century, temperance efforts often relied on moral suasion, including efforts to encourage people to sign voluntary abstinence pledges. In 1842, while he was a member of the Illinois General Assembly, Abraham Lincoln gave a speech supporting temperance and encouraging citizens to take such pledges. But as time went on, legal coercion came to replace persuasion.

Throughout the 1800s, various state laws were put in place to regulate the sale and consumption of alcohol. The Oregon territory—not yet a state—passed a prohibition law in 1843. The first state law was enacted in Maine in 1851. Many of these early efforts were short-lived; several were repealed after only a few years due to lack of popular support, lax enforcement, or judicial decisions against them. But as the century progressed, sentiment in favor of alcohol prohibition increased.

Alcohol as Scapegoat

During the latter half of the 1800s, concern grew about excessive alcohol consumption, saloon culture, and the purported detrimental societal effects of drink. Alcohol was seen as leading to moral decay, crime, poverty, insanity, divorce, violence against women, and neglect of children—the same themes that underlie social purity and anti-vice campaigns today. Alcohol—along with prostitution, obscenity, and drugs—became a scapegoat for concerns about family, societal, and demographic changes brought about by economic restructuring, industrialization, and urbanization. Indeed, the bleak conditions of factory workers and isolation from families as people moved to the cities no doubt encouraged many to seek comfort in the bottle.

In addition, as fears about immigration increased, alcohol control efforts were linked to opposition to the drinking habits of new arrivals, particularly Irish and Germans.

Although temperance was largely a middle-class phenomenon, segments of the early labor movement took up the cause. For example, the Knights of Labor prohibited those connected with the alcohol trade from becoming members. In 1908, the Socialist Party resolved that "any excessive indulgence in intoxicating liquors by members of the working class is a serious obstacle to the triumph of our cause since it impairs the vigor of the fighters in political and economic struggle." And in an unusual alliance, Unionists were joined by employers and business owners concerned that alcohol eroded productivity and led to workplace accidents. (Exceptions were those involved in the liquor trade, the brewing industry, saloon owners, and related industries.)

Physicians, troubled by the negative physical and mental health effects of excessive alcohol consumption, also lent their voices to the movement. In 1917, the American Medical Association (formed in 1847) came out in support of national prohibition, stating that controlling alcohol was a means of controlling syphilis. By the end of the nineteenth century, however, alcohol use had come to be seen primarily as a moral or criminal rather than a health problem.

Finally, some prominent antislavery and African-American leaders such as William Lloyd Garrison and Frederick Douglass spoke out in favor of temperance, and the temperance movement came to be associated with the movement for the abolition of slavery. Nevertheless, some prohibitionists were not above exploiting panic about sexual assaults on white women by black men under the influence of alcohol.

In efforts to curtail the sale of alcohol, women led prayer vigils outside saloons in the nineteenth century. *(Brown Brothers)*

Temperance and Feminism

The temperance movement was profoundly affected by the changing place of women in society, and the movement in turn impacted the social role of women. It is not a coincidence that the feminist movement—usually dated from the Seneca Falls, New York, convention in 1848—and the social purity movements against alcohol, prostitution, and obscenity arose during the same era.

As women left the home, they became increasingly involved in campaigns for social reform. Early efforts by women reflected traditional ideas about their roles as nurturers, caretakers, and guardians of virtue. In addition to mothering their own children, middle-class women began to play a maternal role in the larger social sphere, as illustrated by women's benevolent societies. The Washingtonian Society's women's auxiliary—the Martha Washingtonians—continued this tradition, collecting money and providing support for women and children adversely impacted by drink. Beyond such activities, women—lacking the vote—influenced public policy by such means as demonstrations, prayer vigils, petition campaigns, and in some cases direct action such as saloon destruction.

But women faced obstacles within the movement. At both the Sons of Temperance Convention in 1852 and the World's Temperance Convention in 1853, women were not allowed to speak. Early feminists did not take such affronts lightly, and women's role within the reform movement began to shift from maternal benevolence to demands for equality. Renowned suffragist Susan B. Anthony established the first women's temperance society, the Woman's State Temperance Society of New York, in 1852. Other early feminists such as Lucretia Mott and Elizabeth Cady Stanton also rallied to the cause.

With a Bible in one hand and a hatchet in the other, Carry Nation of the Woman's Christian Temperance Union smashed liquor bottles and furniture in bars throughout Kansas. Such acts of "smashing" and "hatchetation," as she called them, led a Topeka temperance convention to award her a gold medal inscribed, "To the Bravest Woman in Kansas." *(Brown Brothers)*

Alcohol use—and especially saloon culture—was seen as a problem of men. Some suffragists used claims of women's purported moral superiority as an argument for giving women the vote. Drunkenness was said to enflame lust, engender violence, and lead to economic ruin and family dissolution, thus endangering women and children. Among Stanton's demands were that no woman should remain the wife of a drunkard and that state marriage and custody laws should be modified so that drunkards would have no claim to their wives or children. By the time national prohibition was enacted in 1919, women had become a major force and the movement had become closely associated with early feminism. Along with suffrage and the abolition of slavery, temperance was among the first issues for which women agitated publicly and effected major social and legislative change.

The Temperance Movement Gains Strength

As the nineteenth century drew to a close, anti-alcohol groups increased in number and strength, and tended to focus on the elimination of saloons and the outright prohibition of alcohol rather than on voluntary abstinence and moderate use. By this time, most reformers held that alcohol was almost always harmful and addictive, and that moderate users would inexorably be drawn to heavy use and its attendant social ills. Not until the early 1900s would the medical view emerge that alcoholism was a disease that affected some people while others could drink responsibly. The era's attitudes toward alcohol and its inevitable adverse effects were similar to beliefs about drug use that persist to this day.

In 1869, the National Prohibition Party was formed in Chicago as an alternative to the Republicans and Democrats, who many believed were not doing enough to promote temperance. The party gained strength on the local, state, and federal levels throughout the 1880s and 1890s, and was a major force in passing the national prohibition amendment. In the 1884 presidential election between Republican James Blaine and Democrat Grover Cleveland, Blaine supporters denounced the Democrats as the party of "Rum, Romanism, and Rebellion." In 1892, at the Prohibition Party's peak, its presidential candidate John Dedwell received over 270,000 votes.

Temperance Organizations

A leading organization in the campaign to suppress alcohol and vice was the Woman's Christian Temperance Union (WCTU). The WCTU was founded in Cleveland, Ohio, in 1874 as an outgrowth of the Woman's Temperance Crusade. Born of a moral crusade, the WCTU advocated for abstinence in its broadest terms—both from alcohol and from other vices. Its membership included hatchet-wielding vice crusader Carry Nation, who gained fame for destroying saloons. The WCTU was one of the era's many women's organizations that were responding directly to changes in the home and the social milieu. Under the leadership of its second president, Frances Willard, membership in the American WCTU swelled to a quarter of a million members.

Through a conservative/liberal collaboration, the WCTU organized middle-class and working-class

CARRY NATION (1846–1911)

Known as "Hatchet Nation" for her weapon of choice, Carry Nation is the most famous temperance advocate in American history. Moving beyond traditionally female techniques of peaceful petitioning and moral suasion, Nation took up hatchets, rocks, and crowbars in her campaign to banish alcohol from America. Nation considered alcoholic drinks the root of all evil, responsible for the social problems of her day.

Carry Amelia Moore was born on November 25, 1846, in Garrard County, Kentucky, to George Moore and Mary Campbell. Moore was at one time a successful plantation owner, but his fortunes failed while Carry was a child. The family moved to Grayson County, Texas, and then to Belton, Missouri, in 1862. Nation did not receive much formal education, was often sick, and spent much time alone reading the Bible. At the age of ten, she had a religious conversion.

At twenty years of age, Nation was briefly married to Charles Gloyd, a young doctor and a heavy drinker. Their only child, Charlien, was born with ailments Nation attributed to her husband's drinking. In 1877, Carry married David Nation, a lawyer and minister. While living in Texas, Nation decided to devote herself to God by waging war against tobacco and alcohol. At a time when neither the law nor the ministry was a field open to women, Nation used her husband's professional training to advance her own causes, making him her mouthpiece and deputy.

After David Nation became minister in Holton, Kansas, Carry chose his sermons and sometimes wrote them herself. She used his position particularly to speak out against tobacco and liquor.

The Nations moved to Medicine Lodge, Kansas, in 1890, where David Nation took up the practice of law. Again directing her husband's career into the channels of her own interest, Carry encouraged him to prosecute liquor interests in the town. In 1880, voters of Kansas approved an amendment to the state constitution prohibiting the production or use of alcohol except for medicinal purposes. Nonetheless, Kansans continued to drink, and saloons operated unmolested by the local police.

Nation started the Medicine Lodge chapter of the Women's Christian Temperance Union (WCTU) with her friend, Mrs. Wesley Cain, who was married to the local Baptist minister. Nation visited men in jail and urged them to stop drinking. She also spent time helping the poor and was known locally as "Mother Nation" for her benevolence.

In Medicine Lodge, Nation began standing up in church to name local saloonkeepers and to ask why antiliquor laws were not prosecuted. In June 1899, responding to an internal voice that told her to "go to Kiowa," Nation traveled to Kiowa, Kansas, with a wagonload of large stones. In Kiowa, she threw stones at saloons, claiming the illegality of the saloons made her actions legal and defying local officials to arrest her.

Nation and her followers—mostly women—then took their campaign to Wichita, seen as the center of the liquor distribution in Kansas. In Wichita, Nation smashed saloons with a cane, stones, and an iron rod, for which she was arrested and jailed. Nation was arrested another twenty-nine times throughout her life.

Nation first used the hatchet that became associated with her name in 1901 in James Burnes's saloon in Wichita. In 1901, Kansas temperance advocates held a conference in Topeka. Although they did not invite Nation, she attended anyway and organized several hundred people—again, mostly women—into Home Defender clubs, with the purpose of attacking saloons.

Letters from people across the country and around the world came to Nation, asking her to bring her campaign to their communities. She began to travel, lecturing and advocating saloon smashing in many places. She once said to an audience, "Oh, I tell you, ladies, you never know what joy it gives you to start out to smash a rumshop."

Home Defender groups attacked saloons throughout Kansas, and local leaders began to call for stricter enforcement of the 1880 amendment. Nation, an advocate of women's suffrage, told the state's lawmakers, "You refused me the vote and I had to use a rock," drawing a direct connection between her protest and suffrage. The Kansas state legislature responded to the wave of violent activism by passing significant new prohibition laws and by enforcing them more rigorously than before.

Nation also was opposed to tobacco use, snatching cigars out of the mouths of smokers and speaking out against cigarettes as unhealthy and part of saloon culture. She retired to a farm in Arkansas and died in 1911. According to her wishes, her tombstone reads "She hath done what she could." Although Nation made alcohol prohibition a national issue, she is not directly credited with helping to pass the Eighteenth Amendment because most of the advocates of the amendment did not support her violent activism.

Megan J. Elias

women to mobilize in support of social reform. As was the case with many of the social reformers of the day, it would be difficult to describe this organization as either "progressive" or "conservative" in today's terms. Although the WCTU itself did not endorse women's suffrage, Willard supported equality of the sexes and believed that "drink and tobacco are the great separatists between men and women." The WCTU enjoyed the support of church groups and industrialists, but also worked in coalition with labor, actively supporting efforts that had nothing to do with alcohol. Willard was an active member of the Knights of Labor, and the WCTU worked on issues ranging from workers' protection and the eight-hour day to age of consent laws and international peace. The WCTU also worked to support kindergartens and to establish schools for women. In addition, it succeeded in ensuring that children were taught about alcohol abstinence in schools—a harbinger of later attempts by conservative groups to demand abstinence-based sex education. By the early 1900s, every state had laws requiring temperance instruction.

Through its school programs and support of former alcoholics (whose testimonials presaged those of today's Alcoholics Anonymous meetings), the WCTU was able to articulate a moral rationale that inspired other reformers and captured the sympathies of a public swept up in the pro-reform sentiment of the era. But as was the case with later social change movements such as the gay liberation movement, there was a persistent tension between those who believed the WCTU should focus on the single issue of alcohol prohibition and those who favored a broader agenda of social reform. Despite the eventual defeat of national Prohibition, the WCTU is still in existence today.

The Anti-Saloon League (ASL) was founded in Oberlin, Ohio, in 1893 by Howard Hyde Russell, a Congregational minister and former lawyer. It is notable that much of the strength of the prohibition movement came from the Midwest and from rural areas rather than cities. Although the league was financially supported by industrialists such as John D. Rockefeller and Pierre DuPont, its major support came from Protestant churches. ASL had lawyers write anti-alcohol legislation that was put forward by politicians who supported the cause. The bipartisan organization backed both Democrats and Republicans who favored prohibition and lobbied for "dry" (total prohibition of alcohol) laws on both the local and national levels. The league organized a rally of some 4,000 people in Washington, D.C., in 1913 and was a major force in pushing the Prohibition amendment through Congress. The ASL later became the American Council on Alcohol Problems, which remains active today.

The Passage of Prohibition

By the beginning of the twentieth century, many states had introduced their own anti-alcohol laws and over half the country and its territories were "dry." The advent of World War I ushered in an upsurge of patriotism, a growing call for national strength through purity, and intensified animosity toward ethnic and racial "others." The alcohol prohibition effort received a boost from anti-German sentiment, which engendered increased opposition to the largely German-American brewing industry. Prohibition failed to pass Congress in 1914, but the necessary two-thirds majority voted in favor of the Eighteenth Amendment to the Constitution in 1916. The necessary thirty-sixth state, Nebraska, ratified the amendment in 1919. In October 1919, the National Prohibition Enforcement Act—better known as the Volstead Act—went further, outlawing possession of alcoholic beverages. Prohibition—banning the manufacture, transportation, and sale of all alcoholic beverages—went into effect in January 1920.

Reaction to Prohibition

With the passage of the Eighteenth Amendment and the Volstead Act, the stage was set for a new era in America's response to vice. Prohibition was widely flouted, and enforcement proved exceedingly difficult. Smuggling on a large scale could not be prevented, and the illicit manufacture of liquor sprang up with such rapidity that authorities were unable to suppress it. There followed a period of unparalleled illegal drinking and lawbreaking. Speakeasies cropped up everywhere, bootlegging and smuggling were rampant, and bribery and official corruption increased. For most Americans who enjoyed a drink from time to time, Prohibition was less an obstacle than a nuisance.

In the wake of the moral campaigns of the turn of the century, the "roaring twenties" was an era of cultural liberalization characterized by increased freedom for women, sexual license, erotic entertainment, jazz, the development of a youth subculture, and experimentation of all sorts. But the decade was also marked by considerable social anxiety. The fashion among young women for bobbed hair and clothing styles that emphasized a slender figure—rather than corsets that enhanced feminine curves—spurred crit-

icisms about gender ambiguity that prefigured those leveled against men with long hair and beads in the 1960s. Young men and—most scandalously—young women drank alcohol and smoked tobacco (which was then banned in many states) in unprecedented numbers. The traditional small-town American way of life was challenged by exploding urbanization, increased social and occupational mobility, and economic restructuring. Anglo-Saxon Protestants began to lose their former hegemony over American life amid increasing immigration and foreign influence.

By the early 1930s, America was again ready for change. The national mood during the Great Depression was very different from that which prevailed during World War I, when heightened patriotism, xenophobia, and social anxiety had prompted moderates to temporarily side with extremist reformers to pass Prohibition. Many now came to believe that repeal of Prohibition would stimulate the economy and provide much-needed jobs. Others were concerned about the growing loss of respect for the law and hoped that legal availability of alcohol would improve working-class morale in an era of growing revolutionary sentiment. The Association Against the Prohibition Amendment was formed to lobby for repeal. The Women's Organization for National Prohibition Reform—a counterpart to the WCTU—was also established to fight Prohibition, decrying "the hypocrisy, the corruption, the tragic loss of life, and the appalling increase of crime which has attended the abortive attempt to enforce it." Some of the same elite players who once had supported national alcohol prohibition, including Pierre DuPont and John D. Rockefeller, came out against it. In the 1932 presidential election, both Republicans and Democrats supported repeal.

Prohibition had several unintended effects. By driving the alcohol industry underground, Prohibition encouraged criminal activity related to alcohol production and distribution. Organized crime burgeoned—as exemplified by Al Capone, who headed up the illegal alcohol racket in Chicago. The illegality of alcohol made it more profitable and a better risk to produce and transport high-proof distilled spirits compared to beer and wine. Since alcohol is relatively easy to make, production shifted from a few large manufacturers to multiple small-scale producers. And lack of regulation led to inferior, poor-quality alcohol that led to many poisoning deaths. The War on Drugs in the late twentieth century would lead to many of the same consequences.

The End of Prohibition

Congress passed the Twenty-first Amendment repealing Prohibition in February 1933. By the end of the year, the final necessary states had ratified it by 73 percent overall. The ease with which repeal passed demonstrated that the public sentiment underlying Prohibition was shallow. Although crusaders wanted to ban alcohol, mainstream Americans only wished to control the excesses of drunkenness and saloon culture—not to give up their own personal use. In the wake of repeal, the states instituted their own mechanisms for alcohol control. Laws were enacted governing the hours, days, and manner in which alcoholic beverages could be sold. Many state laws were based on the recommendations in a report commissioned by John D. Rockefeller and written by his adviser Raymond Fosdick. Some states mandated that alcohol could only be sold in state monopoly stores. Under religious pressure, many banned sale on Sundays. Today, no state has a blanket prohibition on alcohol but many towns—especially in the South—remain "dry."

Late Twentieth-Century Alcohol Control Efforts

In more recent years, alcohol control efforts have focused on laws against drunk driving and raising the legal drinking age. After Congress passed the Twenty-sixth Amendment in 1970 lowering the voting age to eighteen, states began to extend other adult privileges to eighteen-year-olds. Many found it absurd that men in their late teens could be drafted to fight in Vietnam but could not legally consume a beer. Beginning in the late 1970s, this trend was reversed, in part due to concern about the high number of traffic fatalities involving this age group, but also reflecting an ongoing infantilization of young adults. In 1984, Congress passed the Minimum Drinking Age Law, requiring states to raise their legal drinking age to twenty-one or face the loss of federal highway funds; a majority of states complied by 1986. Today the debate continues. Mothers Against Drunk Driving (MADD) is one of the strongest voices lobbying against lowering the drinking age.

Anti-Drug Movement

The nonmedical use of drugs in the United States extends back to colonial times. Cocaine, opium, and marijuana were not criminalized for much of the country's history. During the Civil War, the use of opium as a painkiller ushered in the birth of modern surgery but left many soldiers addicted. In the mid- to late nineteenth century, the unrestricted dispensing of drugs and the explosive growth of the patent medicine industry brought opiates and cocaine into American homes; even Coca-Cola contained cocaine until 1903. The popularity of such over-the-counter elixirs—which typically were not accurately labeled and were often advertised with extravagant cure-all claims—led to a dramatic increase in drug use and addiction, especially among middle-class white women. The rate of opiate addiction in this era was higher than at any time since.

Opium use was first restricted in the United States in the 1870s, beginning in San Francisco. In 1901, the Senate adopted a resolution prohibiting the sale of opium and alcohol to "aboriginal tribes and uncivilized races." By the early 1900s, several other states had enacted opium laws. Early laws tended to focus on opium dens and opium smoking, which was seen as a vice of Chinese immigrant workers such as those who built the railroad to the West Coast. Agitation for such laws was based to a large degree on antipathy toward the Chinese and fears about Asian men using opium to seduce and sexually corrupt white women.

Amid the growing climate of social reform at the turn of the century, Congress passed the Pure Food and Drug Act in 1906. Before this, various states had a patchwork of laws regulating the distribution and sale of narcotics and cocaine. The 1906 law created the Food and Drug Administration (FDA) and required that labels report the amount of alcohol, cocaine, opium, morphine, chloral hydrate, and marijuana contained in a product, as well as whether the product was potentially habit-forming. The act decimated the patent drug industry and greatly reduced the occurrence of accidental addiction. The Pure Food and Drug Act had a public health rather than a criminal focus; at the time, addicts were widely viewed as innocent victims. It is notable that this health-focused law was one of the most successful in curbing drug use and addiction. In contrast to the Pure Food and Drug Act—which addressed the problem of drug use among the middle class—subsequent drugs laws tended to emphasize criminal penalties and social control, especially of racial and ethnic minorities, working-class and poor people, and counterculture youth.

The Harrison Narcotic Act

In 1909, Congress restricted the importation of opium. The next major federal drug legislation was the Harrison Narcotic Act of 1914. Dr. Hamilton Wright, a physician and the State Department's opium commissioner, was a major advocate for stronger narcotics laws. The Foster Bill, the predecessor to the Harrison Act, was opposed by the drug industry, which in 1913 established the National Drug Trade Conference to persuade Congress to enact a less strict law. The bill was also opposed by Southern Democrats who feared federal encroachment on states' rights, in part because they wished to retain their state laws enforcing racial segregation. To counter such opposition, Wright whipped up fears of cocaine use by African Americans, contending that black "cocaine fiends" were prone to commit violence against whites.

The Harrison Act imposed taxes and registration and recordkeeping requirements on anyone who imported, produced, sold, distributed, or gave away products containing opium or cocaine and their derivatives. (Marijuana was included in the original bill but was deleted before the law was passed.) Although the act did not ban the possession of opiates and cocaine outright, it imposed such high transaction costs that the drugs were effectively outlawed. Congress used a tax measure to implement a moral agenda

that—in an era of strong states' rights—could not be imposed directly; for decades federal drug regulation remained under the purview of the Treasury Department.

The Harrison Act largely targeted physicians and pharmacists who dispensed narcotics, and did not penalize users directly. Initially, the law was not stringently enforced, and the Supreme Court ruled that physicians could prescribe opium and cocaine as they saw fit, including for the maintenance of addicts. In 1919, the Court reversed itself, ruling that addiction maintenance was not an appropriate use of narcotics. In the years that followed, narcotics clinics that maintained and attempted to gradually withdraw addicts—precursors to the modern harm reduction movement—were closed. By rendering opium and cocaine effectively illegal, the Harrison Act drove addicts underground and led to inflated drug prices and increased criminal activity, which in turn reinforced the public image of drug use as immoral and problematic.

Prohibition and the Drug War

The temperance/prohibition movement and the beginnings of the anti-drug movement occurred during the same era and tapped into many of the same social reform sentiments. Both crusades took advantage of uneasiness about social and cultural change and played on fears of disease, crime, poverty, immigration, and family dissolution. But as explained by Richard Bonnie and Charles Whitebread in "The Forbidden Fruit and the Tree of Knowledge," there were also some important differences. The temperance/prohibition movement grew from the grassroots, with religious, feminist, labor, and business groups pressuring legislators to pass anti-alcohol legislation. The issue was a major topic of public debate, and by the turn of the century there was a strong lobby in favor of prohibition.

In contrast, the early anti-drug movement was largely the work of elites. There was no major grassroots push for anti-drug laws, and the drug issue was not particularly prominent in the public debate. The major temperance organizations, as well as feminist and religious leaders, seemed to have little to say about the use of narcotics, even though addictive patent medicines were widely used at the time. In this era, drug use was still seen mainly as a medical rather than a moral or criminal problem, largely because it was a middle-class phenomenon. Although exaggerated fears about Chinese opium smokers and black cocaine users gave an indication of what was to come, attempts to link drug use to anxieties about racial and ethnic minorities, the poor, and the youth counterculture did not really take hold until later in the twentieth century. It was only after the passage of legislation such as the Harrison Act that the public at large widely began to adopt anti-drug attitudes. Indeed, the very passage of such laws helped change the public image of drug use in America.

Early Anti-Drug Campaigns

With the repeal of the Prohibition amendment, social reformers increasingly turned their attention to drugs. Heroin, which by World War I had become a favorite recreational drug among certain urban subcultures, increasingly became associated with violence, crime, and foreign elements. In 1924, the United States banned the importation of opium for use in the manufacture of heroin.

Although hemp was a favored crop in colonial times, by the mid-1930s most states had passed criminal laws relating to marijuana, beginning with Utah in 1915. In the Southwestern states, early marijuana laws were motivated in large part by antipathy toward Mexican immigrants. Public authorities and the media linked use of cannabis to crime, violence, lowered sexual inhibitions, and insanity; one common image was Mexicans selling marijuana cigarettes to white schoolchildren. Although marijuana was beginning to make its way into the urban Bohemian and black jazz subcultures in cities such as New Orleans, New York City, and Chicago, during the 1920s and early 1930s cannabis use was not prevalent. Many middle-class Americans likely were not even aware of the drug's existence, and there certainly was no grassroots campaign to ban it.

In 1930, the United States established the Federal Bureau of Narcotics (FBN), which for its first three decades was headed by crusading Commissioner of Narcotics Harry J. Anslinger. In 1932, a federal commission developed the Uniform Narcotic Drug Act, which Anslinger successfully lobbied the states to pass. The act prohibited opiates and cocaine but left marijuana legislation up to the states. Later, under pressure from state politicians and law enforcement officials, the FBN decided to push for a national marijuana law. The FBN initiated a campaign to educate the public about the dangers of cannabis—as exemplified by the 1936 film *Reefer Madness*—using linkages to immigrants, racial minorities, the working class, and counterculture youth. The Marijuana Tax Act was passed in 1937 with minimal congressional debate. The act did not ban marijuana outright but, like the Harrison Act, imposed such high taxes and

onerous regulation that the drug was effectively made illegal.

The 1951 Boggs Act and the 1956 Narcotic Control Act instituted harsher penalties and mandatory minimum prison sentences for narcotic and marijuana law violations. For the first time marijuana was classified with the most dangerous drugs, under the theory that cannabis use led inexorably to use of harder substances. In this atmosphere of general paranoia, drug warriors such as Anslinger raised fears of Communists distributing drugs to undermine American youth.

The War on Drugs

The political and cultural ferment of the 1960s and 1970s prompted a shift in the targets of moral reformers. Despite leftist revolutions in the developing world, post-McCarthy America was more concerned with unrest at home. Federal Bureau of Investigation (FBI) statistics reported a nearly 50 percent increase in crime during the 1960s. There was renewed emphasis on law and order—and fighting crime often meant combating vice. Liberals were derided as being more concerned about the civil rights of criminals than about crime victims. Politicians set out to sanitize public spaces, and nowhere was the drive to "clean up" America as pronounced as in the realm of drugs.

Both Barry Goldwater in 1964 and Richard Nixon in 1968 used themes of crime and drugs in their presidential campaigns. Rhetoric about the danger to children and members of the middle class presented by escalating crime rates reflected a classic panic—mobilizing racial bias and scapegoating—coordinated by conservative legislators, a burgeoning crime-control industry, and the media. Although Goldwater's campaign was not successful, the panic over crime as a threat to social order played a major role in Nixon's election. In the decades that followed, government funding shifted from social programs toward crime control, police powers increased, and the prison population exploded.

During this era, drug use increased considerably and entered American consciousness as never before. A 1969 Gallup poll estimated that 10 million Americans (4 percent of adults) had smoked marijuana. Drug use was widespread among U.S. soldiers in Vietnam. Along with the established drugs—opiates, cocaine, and marijuana—other drugs, including LSD, speed, and exotic substances such as psilocybin, mescaline, and peyote also gained popularity. The government and the media spun scare stories about the dangers of drugs—including drug-addled youth leaping from windows believing they could fly, and the threat of LSD being introduced into the public water supply—making little distinction between the most harmful drugs and the most innocuous. Already inclined to distrust the establishment, young people who had pleasant experiences with marijuana tended to discount all official anti-drug propaganda.

Nixon's Anti-Drug Campaign

Nixon is often cited as the instigator of the modern War on Drugs. In September 1969, he implemented Operation Intercept, a plan to reduce the supply of marijuana and other drugs coming from Mexico by means of stepped-up searches at border crossings and increased surveillance of air and sea traffic. In 1970, Congress passed the Comprehensive Drug Abuse Prevention and Control Act, which replaced a host of existing drug laws. This legislation included the Controlled Substances Act, which established a system of schedules classifying drugs on the basis of medical use and potential for abuse; schedule one, the most restrictive, includes heroin, LSD, and marijuana. In June 1971, the president announced an all-out offensive against drugs, calling drug abuse "America's Public Enemy No. 1." Nixon created new drug control agencies, including the Office of Drug Abuse Law Enforcement and the Office of National Narcotics Intelligence. This era saw the expansion of law-enforcement tactics such as no-knock warrants and wiretaps that civil libertarians continue to fight today. Nixon appointed the first "drug czar," Myles Ambrose, who proposed the idea of an all-encompassing drug agency. In 1973, existing federal drug efforts were consolidated into the Drug Enforcement Administration (DEA), which remains the key agency in charge of domestic and international drug control.

The strategy used by Nixon and his law-and-order attorney general John Mitchell to associate drug use with criminal activity was similar to that of New York governor Nelson Rockefeller, who during these years instituted a set of draconian drug laws that remain among the strictest in the nation. Rockefeller played on fears about crime and public safety to gain the support of conservatives, while at the same time utilizing rhetoric about treatment (albeit forced) to blunt liberal opposition. Not only did heroin users harm themselves, the argument went, but their addiction led them to commit crimes such as mugging, robbery, and prostitution to fund their habits. Depending on their audience, both Nixon and Rockefeller spoke of drug addiction as either an invading army that must be stopped by militaristic means or a spreading

Seeking to rid their neighborhood of drug dealers, activist Jackie McCray leads a march through Marion, Indiana, on May 14, 1999, chanting, "Up with hope, down with dope." *(AP Wide World Photos)*

disease, cancer, or epidemic that must be stopped by quarantining addicts.

Constructing a Drug Panic

Many of the policies implemented during the 1960s and 1970s appear quite liberal compared to what was to follow in the 1980s and 1990s. In the 1960s, drug addiction was increasingly seen as a medical problem, and several laws were passed to fund addiction treatment and to allow for treatment as an alternative to jail. In 1971, the National Commission on Marijuana and Drug Abuse was established, and its first report in 1972 recommended decriminalization of the drug—a recommendation Nixon ignored. In the years that followed, many states reduced penalties for possession of small amounts of cannabis, essentially decriminalizing personal use. As the 1970s drew to a close, the public had become increasingly tolerant of drug use. Although a 1973 Gallup poll found that 20 percent of respondents thought drugs were the most important problem facing the country, drugs were not even mentioned in the 1979 through 1984 surveys. And a growing number of Americans expressed support for loosening drug laws.

But in the next decade these attitudes began to shift. In the early 1980s, President Ronald Reagan renewed the War on Drugs, reflected in his wife Nancy's "Just Say No" campaign. The demonization of racial minorities and countercultural youth continued. Reformers, the media, legislators, and the public often

focused on a specific drug or population as a stand-in for the drug problem as a whole and for wider social anxieties. The drug panic intensified, with public concern about drug use burgeoning in 1985 and 1986.

In the mid-1980s, drug use came to be seen as a—or even *the*—major American social problem. A *New York Times*/CBS News poll charted this shifting sentiment. While in April 1986 only 2 percent identified drug use as the country's main problem, this number grew steadily; by September 1989, a full 64 percent said drug abuse was the nation's most significant concern. Media attention to drugs exploded with the 1986 deaths of two prominent athletes, Len Bias and Don Rogers, due to cocaine use. Perhaps at no other time had the issue of drugs occupied such a large and troubling space in the public consciousness. The racial nature of the panic was exemplified by the "crack baby" scare, which targeted poor African-American women and played on popular fears about the abuse of children. Criminal prosecution was proposed for pregnant women who exposed their fetuses to drugs during pregnancy, tying the drug issue to the struggle over abortion and women's right to control their bodies. Penalties for crack—a cheap form of cocaine associated with poor urban blacks—were disproportionately increased relative to those for the powdered form of cocaine more popular with wealthier users.

In an escalating cycle, politicians both responded to and exacerbated public anti-drug sentiment. In 1981, Congress amended the 1878 Posse Comitatus Act to allow the armed forces to take part in drug control efforts. In 1986, Congress passed a nearly $2 billion federal drug bill that called for increased enforcement, the death penalty for "drug kingpins," more treatment funding, and sanctions against nations that were not sufficiently cooperative with U.S. drug eradication efforts. In addition, to thwart small producers who were creating drugs chemically similar to controlled substances, legislators passed the Controlled Substances Analogue Enforcement Act to ban so-called designer drugs. The year 1988 saw the passage of the Anti-Drug Abuse Act, which established the Office of National Drug Control Policy, the aim of which was to "restore order and security to American neighborhoods, to dismantle drug trafficking organizations, to help people break the habit of drug use, and to prevent those who have never used illegal drugs from starting." In these and later years, several laws were put into place allowing drug testing in workplaces and schools.

Growing Disenchantment

Ironically, as Erich Goode and Nachman Ben-Yehuda, co-authors of *Moral Panics: The Social Construction of Deviance* (1994), note, fewer people saw drugs as a problem in the late 1970s when actual drug use was quite prevalent than in the 1980s when actual use had substantially declined, exemplifying the "constructed" nature of social problems. Yet just as the social panic about drug use had skyrocketed in the late 1980s, it dissipated at the turn of the decade—demonstrating that social problems can also be "deconstructed." The *New York Times*/CBS News poll found that the proportion of the population identifying drugs as the country's top problem had fallen to 30 percent by April 1990, and by August 1990 it was down to 10 percent. Economic recession and the Persian Gulf War competed with drugs as a social concern, and the media stopped feeding the panic. The fact that moral panics tend to ebb when the country is facing other major problems was demonstrated yet again when the terrorist attacks of September 11, 2001, a new economic recession, and a second war in Iraq once again bumped drugs and sex off the front pages.

Indeed, by the late 1990s and early 2000s, segments of the media had done a turnaround and began to produce stories putting a negative spin on the War on Drugs. Advocacy and lobbying groups such as the National Organization for the Reform of Marijuana Laws (NORML), the Marijuana Policy Project, and Students for Sensible Drug Policy were born. Politicians such as Minnesota governor Jesse Ventura and New Mexico governor Gary Johnson began to speak in favor of drug law reform. Increasingly, drug law reform proponents called for an exploration of various proposals to legalize, regulate, and tax drugs—that is, to treat them like alcohol and tobacco—in order to reduce the negative effects of the underground drug economy. Beginning with California's Compassionate Use Act of 1996 (Proposition 215), a growing number of states passed laws, mostly by voter initiative, permitting the medicinal use of marijuana.

But even as public disenchantment with the War on Drugs grew, most politicians—seemingly failing to read the public mood—were not yet ready to let up. President Bill Clinton, haunted by his own admission of marijuana use, increased anti-drug funding and appointed a strict drug czar, General Barry McCaffrey. The drug war increasingly shaped U.S. foreign policy, especially in Latin America and central Asia. The United States pressured foreign governments to eradicate marijuana, coca, and opium crops, and provided

funding and military assistance for anti-drug efforts. In 1998, Congress passed an amendment to the Higher Education Act denying financial aid to students convicted of drug offenses, and in 2001 it considered the Reducing Americans' Vulnerability to Ecstasy (RAVE) Act, which would penalize owners for any drug use occurring on their property, whether or not they condoned it—or were even aware of it. Although perhaps a majority of today's middle-aged adults—including politicians—have tried some illegal drug, many remain unwilling to challenge the prevailing drug war orthodoxy for fear of sending the "wrong message" to youth.

The Harm Reduction Movement: Outlaw Public Health

The War on Drugs spawned many responses, one of which was the birth of the harm reduction movement. Harm reduction is the philosophy of helping drug users and others engaged in stigmatized behaviors to stay healthy and safe without insisting that they give up their behavior. Born of needle exchange and AIDS activism in the late 1980s, the harm reduction movement continues to grow, building a coalition of syringe exchange workers, AIDS activists, health and social service providers, drug policy reformers, researchers, women's rights advocates, local and state politicians, and advocates of progressive healthcare and criminal justice reform. At its core, it is a movement that promotes a more humanistic, less moralistic approach to individual and social problems.

The roots of the harm reduction movement can be traced to the early years of the century, when certain doctors and clinics provided morphine or heroin to prevent withdrawal in people who had become addicted to opiates. However, in 1919 the U.S. Supreme Court ruled that addiction maintenance was not an appropriate use of narcotics, and in the years that followed existing narcotics maintenance clinics were closed. In the 1960s and 1970s, addiction increasingly came to be seen as a medical problem. By this time, maintenance therapy with methadone—a long-lasting synthetic narcotic that staves off withdrawal symptoms and drug cravings—had become the accepted method for treating opiate addiction. Modern methadone maintenance therapy was pioneered in the 1960s in New York City by Drs. Vincent Dole and Maria Nyswander. Rather than using decreasing doses of methadone to wean addicts off drugs, long-term maintenance therapy was designed to stabilize drug users. By providing a safe and legal alternative to heroin, methadone maintenance is intended to help addicts stop committing drug-related crime, separate themselves from the drug subculture, and lead productive lives. Although officials generally have supported methadone maintenance as a way to reduce crime, some drug warriors, moral reformers, and public health professionals oppose methadone maintenance, contending that it simply substitutes one drug dependency for another.

On March 27, 2001, demonstrators march to the Capitol Building in Albany, New York, demanding reform or repeal of the Rockefeller anti-drug laws. The laws, spearheaded by Governor Nelson Rockefeller in the 1970s, were among the harshest ever passed. *(AP Wide World Photos)*

The growing AIDS epidemic in the late 1980s spurred the development of the harm reduction movement in the United States. As a self-conscious approach and philosophy, harm reduction first emerged in the Netherlands in the early 1980s as a pragmatic partnership between drug users and city officials, who started a needle exchange program to tackle the growing problem of hepatitis B transmis-

sion. The first American needle exchange programs were set up by grassroots AIDS activists, front-line AIDS service workers, civil rights activists, and current and former drug users. Faced with official denial and hostility regarding AIDS, and recognizing the explosion of HIV in poor urban communities, activists took clean needles to the streets in direct acts of civil disobedience. Harm reduction programs such as syringe exchange were designed to be "low threshold" and able to meet drug users "where they're at," rather than demanding that they stop their use. Most early activists explicitly rejected the abstinence orthodoxy of the era, which held that drug users could be helped only by stopping drug use completely.

The earliest underground needle exchanges were established in 1986 in New Haven and Boston by Jon Parker. The Point Defiance program in Tacoma, Washington, organized by Dave Purchase, was perhaps the first to operate with the tacit approval of public officials. San Francisco's Prevention Point was established by activists in 1988 and operates today under a city-declared state of emergency. The New York City Health Department began an experimental syringe exchange in 1988, but the program was "high threshold," requiring that clients enter drug treatment, and was inconveniently located across the street from city hall. Members of ACT UP/New York began a "low-threshold" needle exchange on the Lower East Side of Manhattan soon thereafter. The operators of the needle exchange were arrested for providing syringes, but the charges were thrown out when they successfully argued that exchanging needles was a "medical necessity" to prevent the spread of HIV and therefore to save lives. According to the Centers for Disease Control and Prevention (CDC), by the end of the 1990s there were over 100 needle exchange programs in the United States exchanging nearly 20 million syringes per year.

Harm reduction in the United States has been an "outlaw" practice, in stark contrast to the experience in many other countries, including Australia, Canada, and several European nations. In such countries, the consensus is that AIDS constitutes a greater immediate threat to public health than drug use. No such consensus has been possible in the United States. No presidential administration has allowed federal funding of syringe exchanges. Public opposition came from moral crusaders who believed that the harm related to drug use should not be minimized, lest users be discouraged from quitting (although some reformers reluctantly supported needle exchange to protect the "innocent" sexual partners and babies of injection drug users). Other objections came from law-and-order proponents and "NIMBY" community members who feared needle exchanges would contribute to crime. As a result, by 1996 the United States reported over 146,000 cases of drug-related HIV transmission.

Another current of opposition to needle exchange came from communities devastated by drug use and the drug economy. For many people in such communities, AIDS was not the priority. Drug dependency, drug-related violence and crime, and the resulting impacts on social and economic life were experienced as more serious problems. Far from being seen as a life-saving measure, syringe exchange and harm reduction more generally were resisted and denounced by leaders of communities of color as enabling the very behavior that was killing their people and damaging their neighborhoods. In order to work with and within the most affected communities, there was a need to take harm reduction beyond HIV prevention and toward an analysis of and response to the multiple harms related to drug use, drug sales, and anti-drug policy. The Harm Reduction Coalition, formed in 1993, remains a key player in expanding harm reduction efforts across the United States, guided by a broad vision of social change that includes community involvement, criminal justice reform, universal healthcare, reproductive rights, and civil liberties.

As the 1990s progressed, the magnitude of the AIDS epidemic and the demonstrated success of needle exchange programs began to turn the tide. By the late 1990s many public health officials and much of the populace accepted harm reduction as a strategy for reducing disease transmission. As harm reduction moved in from the outside, needle exchange and related programs were "professionalized," often leading to increased bureaucracy, regulation, and the exclusion of the grassroots activists who had pioneered the strategy. As harm reduction efforts have been mainstreamed, they have sometimes come to resemble technical interventions directed at "them" (drug users) for the sake of "us" (the public), rather than programs by and for affected communities.

Following the example of needle exchange programs, the harm reduction philosophy has been extended and applied to other types of socially stigmatized behavior. For example, sex worker activists have developed peer education programs to teach prostitutes how to work more safely and protect themselves from disease transmission. Drug user activists have advocated for education and self-administered medication (naloxone, or Narcan) to

prevent deaths from heroin overdose. And ravers such as those who founded DanceSafe have begun programs to test the purity of ecstasy and other drugs used in dance clubs. Although official and public opposition to drug use remains strong, grassroots activists have increasingly taken public health into their own hands.

Lessons from the War on Drugs

Like Prohibition, the War on Drugs produced several unintended consequences, including the greater availability of harder substances, an increase in experimentation spurred by publicity about drugs, promotion of an underground market and its attendant crime and violence, and the development of an addict subculture. Although crime is unquestionably associated with drug use, advocates of drug law reform contend that it is not drugs themselves that cause crime, but rather their high price on the black market, which prompts many addicts to turn to crimes such as robbery and prostitution to support their habits. Based on its stated aims, the War on Drugs appears to be a failure. But as Erich Goode points out, proponents of the anti-drug crusade—like other anti-vice movements—do not measure its success by whether or not it is able to achieve its purported goal. Rather, the crusade serves an ideological agenda, allowing politicians to promote a law-and-order image. In addition, prohibitionist crusades provide a focus for social anxieties about political unrest, urbanization, economic restructuring, the changing place of youth in society, and, especially, race.

One of the most visible outcomes of the drug war has been the explosion in the prison population, in particular the incarceration of young men of color. Today, the "prison-industrial complex"—the network of judges, police, prison officials, and those who profit from building and operating prisons—is large and influential and plays a role in perpetuating the drug war out of economic self-interest. One of the downfalls of Prohibition was that it became obvious that laws against alcohol were unfairly enforced, falling heavily on the working class while the middle and upper classes were spared. Similarly, during the 1960s and 1970s, drug laws often were selectively enforced against hippies and student radicals by a government and police force trying to thwart challenges to their authority; despite "mandatory" sentences, children of the wealthy and powerful seldom paid a criminal price for their drug experimentation. In addition, drug law enforcement focused on African Americans and Latinos, whose involvement in civil rights protests and potential for social revolution offered the most serious threat to the American elite since the early 1930s. Although several studies have shown that drug use is not more common among blacks compared to whites, by the 1980s and 1990s African-American youth were the primary target of drug enforcement. Just as McCarthy in the 1950s spoke of Communists as an "internal enemy" that would undermine the country unless assiduously rooted out, in the latter half of the century the most feared "enemies within" were communities of color.

Although progressives tend to see social problems such as crime, drug use, and poverty as being grounded in social conditions, and therefore remediable by social solutions, conservatives tend to see them as individual moral failings that are best addressed by punitive measures. In the final decades of the twentieth century the conservative view held sway. As the emphasis on crime overshadowed issues such as civil rights and economic entitlement, government expenditures followed suit. Funding for public education declined as monies for the prison industry grew. The 1994 California "three strikes" law—which imposes life sentences for people convicted of three felonies—exemplified the increasingly harsh attitude toward lawbreakers. For young people of color, the policies of the 1980s and 1990s created a contentious society divided along class and race lines. Although the moral panic nominally focused on drugs, its result has been the control of racial and ethnic minorities and the poor.

Progressive Movement

Several generations of historians have agreed that there was a period of time—beginning in the late 1800s and ending sometime around World War I—when the majority of Americans were so immersed in the quest for "progress" and "reform" that those years could fairly be called "The Progressive Era." Yet, those same historians have generally disagreed—fundamentally and vociferously—over whether or not that era's myriad activities and achievements were the result of a definable "Progressive movement," energized by a reasonably coherent ideology worthy of the label "Progressivism."

The Historical Debate

The existence of that debate dates at least from the publication of Benjamin Parke De Witt's *The Progressive Movement: A Non-Partisan, Comprehensive Discussion of Current Tendencies in American Politics*. In that pioneering work, De Witt acknowledged that the term *Progressive Movement* has "been so widely used, so much discussed, and so differently interpreted that any exposition of its meanings and principles, to be adequate, must be prefaced by careful definition." To some contemporaries, he said, the term merely "represents the efforts of a small body of self-seeking politicians to gain position and influence by making capital of a movement that is temporarily popular." To others, it "expresses the efforts of a few sincere but misguided enthusiasts to carry out an impossible and chimerical program of social reform through government and legislation."

Although some saw the Progressive movement as "new, fleeting, and evanescent," De Witt himself viewed it as "permanent, deep-seated, and fundamental, involving a modification and readjustment of our political theories and institutions." Although conceding that "this widespread political agitation" frequently seemed "incoherent and chaotic," De Witt nevertheless insisted that careful examination and analysis revealed three unifying "tendencies": (1) the insistence by the "best men in all political parties" that special interests be eliminated from government and politics; (2) the demand that the structure or machinery of government be controlled by the many instead of the few; and (3) the rapidly growing conviction that the functions of government must be increased and extended to relieve social and economic distress. It was these three "tendencies"—manifested in political platforms and programs and in reforms advocated and enacted in city, state, and nation—that "may be said to constitute the real progressive movement," because of their "universality and definiteness."

Over the ensuing half-century, numerous scholars attempted to distill the essence of what they conceived of as a generic progressive movement. For the most part, they sought to define that movement by applying one or more of three criteria: a common social type; a shared system of values; or a reasonably coherent program of "reform." The high-water mark of their efforts occurred during the 1950s and 1960s in the work of the "status revolution" and "organizational revolution" historians. The status revolution historians, led by Richard Hofstadter and George Mowry, utilized "collective biographies" of the period's intellectuals and activists to construct a "progressive profile" that almost exclusively contained people of British-American roots, middle- to upper-middle-class social status, above-average formal education, and "touched by the long religious hand of New England."

In their view, the Progressive movement was fundamentally "an expression of an older America objecting to the ideological and social drifts of the twentieth century," especially the rise of the monopolistic corporation, on the one hand, and organized labor and socialism, on the other. Their security and position thus threatened from above and below, the members of this gentry abandoned their customary

distaste for organized intervention and political action in order to restore their vision of the pristine quality of an earlier American life. The founders of the status revolution school maintained that "progressive reform drew its greatest support from the more discontented of the native Americans, and on some issues from the rural and small town constituencies that surrounded the big cities."

Whereas the status revolution historians believed that the Progressive movement reflected the "complaint of the unorganized against the consequences of organization," the proponents of the organizational revolution interpretation turned that idea on its head. For Robert Wiebe, Samuel Hays, Louis Galambos, James Weinstein, and other noted scholars, that movement was centered in the activities of a "new middle class" engaged in a "search for order." It was a concerted effort by an emerging elite group of professionals, bureaucrats, administrators, intellectuals, and technicians to impose their vision, structure, and values upon a society and culture dangerously fragmented and disoriented by rapid and massive change. In short, the essential dynamic of progressivism was not "power to the people," but the flow of decision making of all sorts upward in an increasingly rigid hierarchy of authority.

Even during the heyday of the status revolution and organizational revolution schools, however, many other historians provided evidence of significant reformist activity among segments of the population that not even the most elastic interpretations of either could encompass: the urban, foreign-stock working class, midwestern German-American Catholics, Socialists, entrepreneurs, and agrarian radicals, to name only the most cited. "Movements with tolerable progressive credentials," historian Lewis Gould has written, "have been found in the agrarian South, among machine politicians in the city, within technical and professional groups, the military, the arts, as well as in the more familiar environs of middle-class America."

Some historians openly questioned whether the movements delineated by the status revolution and organizational revolution interpretations were really "progressive" in any meaningful sense, whereas others argued that the progressive profiles upon which these explanations were based failed to differentiate avowed "progressives" from admitted "conservatives." They pointed out that virtually every significant issue of the era drove deep fissures within the ranks of both "movements," and that the label "progressive" was frequently affixed by both contemporaries and historians to mutually contradictory ideas, goals, and programs.

By 1970, at least one historian proclaimed that the Progressive movement never existed. In a provocative article entitled "An Obituary for the Progressive Movement," Peter Filene charged that historians were "struggling desperately" to fit their concept of a progressive movement "onto data that stubbornly spill over the edges of that concept," largely because "they are dealing with an aggregative group as if it were a collective group." Starting with the observation that many early twentieth-century Americans were "reformers" or "progressives," he asserted, historians have leapt to the conclusion that Americans, therefore, joined together in a "reform" or "progressive movement," thus "slurring over the intermediate question of whether the reformers themselves felt a common identity and acted as a collective body." A "diffuse progressive 'era' may have existed," he argued, "but a progressive 'movement' did not."

Although there were plenty of "progressives," Filene continued, they were of "many types"—intellectuals, businessmen, farmers, labor unionists, white-collar professionals, politicians, lower, middle, and upper class, southerners, easterners, westerners, urban, and rural—and their differences were at least as significant as their similarities in explaining the nation's response to its profound transformation during those crucial years. Contending that "the evidence points away from convenient synthesis and toward multiplicity," Filene concluded that "the progressive era seems to be characterized by shifting coalitions around different issues, with the specific nature of these coalitions varying on federal, state, and local levels, from region to region, and from the first to the second decade of the century."

Although a few historians continue to acknowledge a single Progressive movement, most historians have conceded that there were—at the very least—a variety of Progressive *movements*, sometimes working in harmony, frequently acting at cross-purposes, and often having little in common save rhetoric and style. In his introduction to the reissue of De Witt's *The Progressive Movement*, Arthur Mann warned that, in assessing the validity of the earlier interpretation, "the whole should not blind us to its parts." The Progressive movement, he asserted, "is an umbrella term, an historical shorthand, that covers a variety of reform thrusts fifty and more years ago in the churches, the universities, social work, publishing, journalism, racial relations, and so on almost indefinitely." It was "in short, a many-sided affair."

In a perceptive article entitled "In Search of Progressivism," written in the early 1980s, Daniel T. Rodgers chided those fellow historians seeking to salvage the Progressive movement and Progressivism by engaging in a "rage for bifurcation": social vs. structural, insurgents vs. modernizers, urban vs. rural, or western vs. eastern—but "Progressives" all. If these contradictory lists proved anything, he argued, it is that "those who called themselves progressives did not share a common creed or a string of common values, however ingeniously or vaguely defined." At most, Rodgers asserted, those who called themselves Progressives drew upon "three distinct clusters of ideas—three distinct social languages—to articulate their discontents and their social visions": the rhetoric of antimonopolism, an emphasis upon social bonds and the social nature of human beings, and a language of social efficiency. Although Rodgers doubted that most historians would "call off the search for that great overarching thing called Progressivism," he concluded that their real task was to concern themselves "less about the internal coherence of the progressive 'movement' than about the structures of politics, power, and ideas within which the era's welter of tongues and efforts and 'reforms' took place."

The Great Transformation

The first step in performing that task is to recognize that the Progressive Era was a time of breathtaking metamorphosis. Those people whose minds "boggle" at the magnitude and velocity of the changes being brought about by the twenty-first century's electronic revolution should have little difficulty identifying with those who experienced that earlier transformation firsthand. Those growing up in the early twentieth century were every bit as awe-stricken by the introduction of electricity, steam turbines, internal combustion engines, skyscrapers, electrified street railways, elevators, and motion pictures as we are by personal computers, the Internet, cell phones, Palm Pilots, DVDs, and similar electronic wizardry. Looking back over his life of sixty-plus years from the vantage point of the 1920s, novelist Hamlin Garland proclaimed that he had "seen more of change in certain directions than all the men from Julius Caesar to Abraham Lincoln." He had, he marveled, witnessed "the reaping hook develop into the combined reaper and thresher, the ox-team give way to the automobile, the telegraph to the radio, and the balloon to the flying machine." Television, he fearlessly prophesied, "is certain to arrive tomorrow."

At least as bewildering was the rapid and drastic reconfiguration of the socioeconomic order resulting largely from the widespread diffusion of these technological marvels. Deliberately or uncannily using the age's high-speed, complex, precision machinery as metaphor and model, an emerging elite of entrepreneurs, financiers, intellectuals, professionals, technicians, managers, bureaucrats, and politicians strove to recast most facets of existence into large-scale, compartmentalized, impersonal systems made up of discrete, hierarchically arranged components. People—like machine parts—became increasingly interchangeable and disposable. Those on the "cutting edge" of this metamorphosis strove to drive into as many people as possible the discipline and worldview of the modern, urban, industrial order, which prized predictability, docility, standardization, and an insatiable appetite for consumption of mass-produced goods and services. Nearly everything from sports to entertainment to recreation to politics was increasingly "commodified": packaged, advertised, and sold to a nation of consumers and spectators. In virtually every line of human endeavor, productivity, efficiency, and expertise became the operant values cherished by those determined upon what historians Alan I. Marcus and Howard P. Segal have dubbed "systematizing the fabric of American life."

Driving this remarkable transformation were the "neotechnic revolution" and the "new industrialism." Whereas the first two stages of the industrial revolution had relied upon water, wind, and steam to energize its machinery, the neotechnic phase employed electricity and the internal combustion engine as its power sources. Whereas people of the earlier two phases had built their machinery and structures primarily out of wood, brick, stone, and iron, the people of the neotechnic revolution increasingly utilized steel and other fabricated metals. Significantly lighter, stronger, and more flexible than iron, steel provided the essential metal for massive, high-speed, precision machinery, high-rise construction, and modern transportation and communication media.

Steelmaking evolved during the late nineteenth century out of continuous improvements in the superheating of ores, culminating in the discovery of the open hearth process that allowed large quantities of scrap metal to be mixed with relatively small amounts of molten pig iron to produce ten times as much steel—of significantly greater tensile strength—than that yielded by the earlier Bessemer process. Between 1895 and 1900, the amount of steel produced nearly tripled—to almost 4 million tons per year. Similar developments also revolutionized the brass, bronze, and

copper industries. This technological sea change permitted the construction and operation of gigantic, fast, precise machines capable of being run almost constantly in order to produce a seemingly infinite supply of goods.

To take the fullest possible advantage of these innovations, manufacturers expanded and redesigned their factories for mass production, eventually developing the assembly-line method. To raise the necessary capital, they eagerly embraced the corporate form of organization, which also provided them with limited legal and financial liability while virtually guaranteeing the immortality of the enterprise. These highly capitalized, large-scale, complex organizations rapidly came to dominate the vast majority of industries in the United States and to transform them through innovative strategies and techniques in production, distribution, and marketing. They also drastically redefined the nature of work, the workplace, and the workforce, transferring "skill" from the worker to the machine and decision making from the shop floor to the central office. The need for "skilled" artisans and craftsmen declined precipitously, while the demand for "unskilled" and "semiskilled" machine operatives expanded, substantially increasing the number of women, children, and recent immigrants in the industrial workforce.

At the same time, as economist Richard T. Ely observed in 1889, "Every new invention, every economic improvement, in short, nearly all industrial progress centralizes the population in cities." Between 1890 and 1920, the total urban population of the United States grew from 22,106,000 to 54,158,000; the percent urban from 35.1 to 51.2; the number of urban places from 1,348 to 2,722; and the number of cities of over 100,000 population from 28 to 68. Urban population grew nearly twice as fast as total population during those three decades. While the electric trolley and the automobile enabled cities to expand ever outward, the electric elevator, structural steel, and reinforced concrete allowed them to soar steadily upward. Increasingly, the burgeoning urban masses found themselves segregated and stratified according to a complex formula of socioeconomic and ethnocultural factors, while the mobility and instability of city life accelerated at a dizzying pace. Demands for an expanded range of municipal services from all quarters of the city escalated, giving rise to continuous conflicts over how, by whom, where, and in what order these would be provided, delivered, and financed.

"Natives" and Newcomers

Although this urban population explosion was fueled significantly by the "natural increase" of births over deaths—due primarily to remarkable improvements in medicine and public health—and by the movement of native-born Americans off the farms in search of a better life, an increasing proportion was provided by immigration from Europe, Asia, and the American South. After surging during the 1880s and declining during most of the depression-ridden decade of the 1890s, European immigration hit an all-time high between 1897 and 1914, averaging nearly 800,000 per year. Moreover, the bulk of these new arrivals came from southern and eastern Europe—from Italy and the Mediterranean and from the multiethnic empires of Austria-Hungary, Russia, and Turkey. Their clothing, language, customs, and religions seemed increasingly strange and threatening to old-stock Americans—even to the descendants of the Irish, German, and Scandinavian immigrants whose arrival had evoked similar reactions just a few decades earlier.

Even more unsettling to white America was the relatively minor influx of Chinese and Japanese immigrants to the West Coast that gave rise to fears of an irresistible "yellow peril." Driven by the same economic imperatives that impelled native-born Americans, European and Asian immigrants flocked primarily to the cities and factories of the Northeast, Great Lakes, and Pacific Coast, where they strove to survive and prosper while preserving as much as possible of their Old World identities and cultures. Although more often the primary victims of industrialization and urbanization, they frequently served as handy scapegoats for those seeking to assign blame for the nation's problems. Perhaps even more disturbing to white Americans was the "Great Migration" of southern "Negroes" to northern cities. Whites increasingly responded with de facto segregation of housing, schools, and public accommodations, job and wage discrimination, and violent "race riots." By the onset of World War I, almost every Northern city of any size had its "black ghetto," where living and working conditions were generally the worst in town.

From a national perspective, the Gilded Age and Progressive Era combined constituted a period that prominent historian Rayford W. Logan has labeled the "nadir of American Racism." With the end of Reconstruction, Southern states moved quickly to negate the Fourteenth and Fifteenth Amendments, instituting legal segregation in public facilities and disfranchising

Residents view the devastation in Chicago following the race riots in the summer of 1919, a year that witnessed some of the bloodiest and most destructive riots in American history. Despite many reforms instituted during the Progressive Era, race relations hit a nadir as segregation became widespread and entrenched in the early 1900s. *(Brown Brothers)*

virtually the entire African-American electorate. At the same time, lynching and other forms of violence against "Negroes" reached an all-time high. Responding to pressure from organized labor and West Coast populations in general, Congress moved to exclude virtually all Asian immigration. In 1911, the U.S. Immigration Commission issued a forty-two-volume report that blamed the "inferior races" from southern and eastern Europe for most of the nation's problems and pronounced them incapable of assimilation into American society. After World War I, its findings provided much of the documentation for the highly biased and restrictive National Origins Quota System that virtually ended immigration from southern and eastern Europe and Asia.

Meanwhile, the General Allotment Act of 1886 broke up what remained of tribal lands and mandated the forced acculturation of Native Americans, while the U.S. Army callously suppressed any remaining armed resistance. By 1910, most scholars regarded them as a "vanishing race," a judgment seemingly documented by the census returns. Similarly, American incursions into Hawaii, Puerto Rico, the Philippines, Samoa, Guam, China, and other parts of Asia and Latin America were justified largely by a belief in the "racial inferiority" of their inhabitants and in

the responsibility of the United States to "civilize" and "Christianize" them. Perhaps most telling of all was the fact that "experts" generally agreed upon the notion of a racial hierarchy with "white people" at its apex, a worldview that justified everything from segregation to immigration restriction and from forced acculturation to eugenics—the "science" of human breeding.

Americans adapted as best they could to the ongoing changes of the early twentieth century. Largely by trial and error, growing numbers hit upon a three-stage strategy. The first stage was to band together with others in similar situations or of compatible persuasions—whether as producers, consumers, taxpayers, citizens, professionals, or members of a particular ethnocultural group. The second step was to attempt to intervene purposefully and effectively into the process through which the fruits of the new socioeconomic order were distributed. The third phase was to call upon government—at all levels—to intervene in that process on behalf of those who felt aggrieved or injured.

Early Reform Movements

Prior to the severe economic depression of 1893–1897, most of these reform movements fit into three broad strains, each of which operated in effective isolation from—and often at cross-purposes to—one another. The first of these was the patrician strain, composed of middle- and upper-middle-class native-born Americans, who were inclined to place the blame for most of society's problems on the weaknesses and excesses of the social orders above and below them. Accordingly, they usually favored limited government, fiscal retrenchment, the elimination of patronage and political corruption, and anti-vice crusades. Regularly derided as "goo-goos" or "Mugwumps" by their opponents, they tended to feel that most of the world's problems could be solved by replacing "bad" men with "good."

At the other end of the spectrum were a variety of movements firmly rooted in the urban, industrial working class, such as the Union Labor Party, the Socialist Labor Party, and the Knights of Labor, which placed the onus for social ills primarily on the capitalist system and on the rapacity of the people who managed it. While the more radical members of this cohort boldly espoused collective ownership of property and the establishment of a cooperative commonwealth, the majority demanded more realizable goals, such as higher wages, shorter hours, and better working and living conditions.

Forming yet a third strain of Gilded Age reform movements were several predominantly agrarian associations and organizations, such as the Grange, Alliances, and Populists. Identifying their enemies primarily as the railroads, banks, grain elevator operators, and their political allies, agrarians combined to maximize their own economic power, while petitioning government to regulate the rates and services of those whom they perceived to be their oppressors. Although the 1892 Omaha Platform of the People's Party proclaimed that "the interests of rural and civil labor are the same; their enemies are identical," efforts to forge a working alliance between the two usually ended in mutual frustration. Also standing in the way of effective cooperation among the three strains were deep-seated ethnocultural and religious issues, and the persistence of a mutual urban-rural animus. Cooperation across all of these fissures was rarely, if ever, possible.

Reinforcing those boundaries were an interlocking set of beliefs and values that historian Eric Goldman has called "the Steel Chain of Ideas." Among its strongest links were a series of supposedly absolute and unchangeable "natural laws" and "natural rights": the law of supply and demand, the iron law of wages, the law of diminishing returns, governmental laissez-faire, and the inviolate right to private property. Conveniently ignoring the fact that the growing dominance of large corporations was due primarily to their ability to manipulate those very same "natural laws" to their own advantage, the nation's elite adamantly denied that same privilege to labor unions, producer and consumer cooperatives, government agencies, and lawmakers. For others to intervene—either to regulate or tax corporations and their owners or to provide assistance to other segments of society—would allegedly only make matters worse for everyone by undermining the self-regulating "natural order" of society.

Another strong link in the chain was provided by the advocates of Social Darwinism, an analogous concept to the theory of evolution which argued that the prime law of society—like the prime law of nature—was "survival of the fittest." Only the "fittest" prospered, and their prosperity was all the proof necessary of their "fitness." By the same token, failure was proof positive of "unfitness." In society, as in nature, aiding the unfit or restricting the fit jeopardized the chances of survival for the entire species. Yet another link was provided by the proponents of the "Gospel of Wealth," a takeoff on the Calvinist doctrine of predestination. In John Calvin's view, the "elect" prede-

termined by God for salvation gave testimony to their status by their piety and purity, while those predestined to eternal damnation betrayed their status by leading dissolute and sinful lives. According to the Gospel of Wealth, God rewarded the elect with material wealth in this life and punished the preternaturally damned with poverty and deprivation. Thus the sanction of theology was added to that of science and philosophy in order to justify the status quo and to stigmatize any attempt to alter it.

The Reform Movements Mature

Dissolving the Steel Chain of Ideas—and building organizational strength sufficient to provide even minimal challenges to corporate domination—was a slow and laborious process during the last quarter of the nineteenth century. Its biggest boost was provided by the depression of the mid-1890s, whose severity and duration starkly revealed many of the societal dislocations and inequities that were easily ignored during more prosperous times. The depression transmitted those disabilities to large numbers of people who had previously thought themselves to be invulnerable. Problems easily rationalized during good times demanded much more thorough examination now that they touched a significant portion of mainstream society and—as more astute observers noted—those problems did not disappear with the return of general prosperity. Such traumatic experiences also made it easier for people of backgrounds previously antagonistic to one another to realize their shared situations and concerns as taxpayers, consumers, and citizens and to unite in "common cause" on many issues.

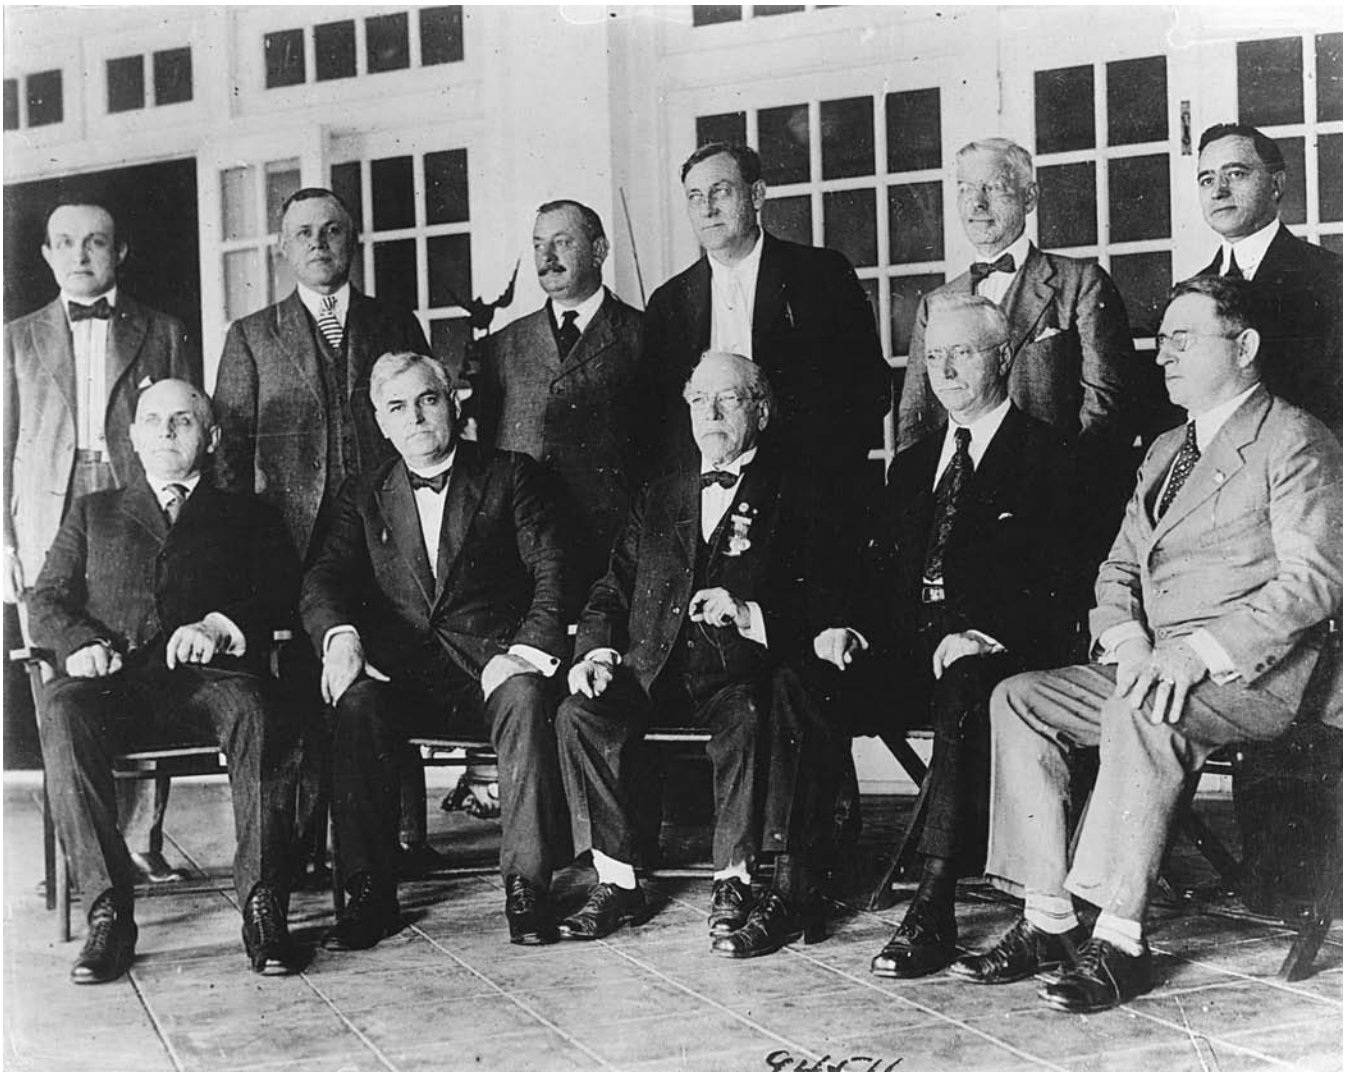
This "Crisis of the 1890s" also accelerated the growth of three intellectual movements antithetical to the principles of the Steel Chain of Ideas: the social sciences, the ascendancy of professionalism and expertise, and the Social Gospel. Awed by the achievements and prestige of natural and physical scientists, economists, sociologists, psychologists, historians, and political scientists sought to adapt empirical, inductive methods to the study of human behavior. Rejecting a priori, deductive approaches to the acquisition of knowledge, they stressed the importance of intensive case studies and of the scrutiny of meticulously gathered evidence before forming any conclusions or proposing any remedies. They generally decided that the nation's social problems were the result of self-interested decisions made by powerful individuals and organizations. Many became social and political activists determined to intervene into those same processes on behalf of what they considered to be the general welfare.

Closely intertwined with rise of the social sciences was the growing professionalization of medicine, law, engineering, journalism, social work, education, and a variety of other occupations. Each of these professions developed a systematized and specialized body of knowledge, detailed rules of procedure, a technical vocabulary or "jargon," schools to train aspirants, sanctions and enforcement machinery to discipline those who violated professional norms, journals to communicate among themselves, and an espirit de corps that bound together its members and set them off from "amateurs." Collectively, social scientists and professionals constituted a burgeoning cadre of "experts," who alone possessed the specialized knowledge and methodology needed to solve complex social problems and to function effectively, efficiently, and justly in the modern world. Balancing the need for "efficiency" and "expertise" against the desire for more popular participation and influence rapidly became a classic question of the times.

Attacking the status quo from a different—but equally influential—perspective were the proponents of the Social Gospel, also referred to as the "New Religion" or the "Institutional Church." Its apostles insisted that the road to salvation and spirituality lay not in personal piety and was not signified either by upright behavior or by material prosperity, but rather in how one treated those less fortunate. True Christianity manifested itself "in ethical movements, in benevolence, in expressions of genuine brotherhood." Although Social Gospelers frequently disagreed with social scientists and professionals on a variety of specific issues, they joined with them in challenging the notion that society was a closed system governed by rigid and unchangeable natural laws that justified "what is," rather than finding ways to move toward "what should" or "what could" be.

The "New Interventionism"

Energized by the trauma of a severe, protracted depression and by these new intellectual currents, a large number of fin de siècle Americans began to engage in what historian John W. Chambers has called the "new interventionism." At the outset, most of them practiced "associationalism" or "voluntarism—organized action by nonstatutory institutions" in the private sector—a strategy that Alexis de Tocqueville had long before identified as the peculiar genius of Americans. Labor abided by the "pure and simple trade unionism" dictum of Samuel Gompers, prefer-



With its doctrine of "pure and simple trade unionism," the American Federation of Labor came to dominate the American labor movement in the early twentieth century. Its founder, Samuel Gompers, seated in the center with the executive council, led the organization for almost forty years. Following Gompers's death in 1924, William Green, standing second from left, became president. *(Brown Brothers)*

ring collective bargaining, strike, and boycotts to lobbying for legislation. The National Consumers Union granted its seal of approval to businesses that met its standards and placed noncompliers on its "blacklist." The Women's Trade Union League engaged in organizing drives, joined picket lines, and gave aid and comfort to strikers. Idealistic young women and men, imbued with a mixture of social science and the Social Gospel and funded by private philanthropy, founded social settlements where they lived among and ministered to the urban underclasses. Business associations embraced volume buying to compete with the economies of scale enjoyed by big corporations, while the Immigrants' Protective League established waiting rooms, provided interpreters, procured transportation, jobs, and lodging, helped locate relatives, and screened employment agencies, banks, and night schools. The Country Life Movement sought to make the agrarian environment more attractive, to bring the benefits of urbanism to farmers, and to stem the tide of "rural drain" to the cities.

Many organizations turned to political action—if for no other reason than that their perceived enemies were doing the same thing. Many came to realize that only government possessed the leverage necessary to achieving their ends. Organized labor found its meth-

ods ineffectual as long as unions were regarded as "conspiracies," "yellow dog" contracts and labor spies were legal, and strikes and boycotts could be easily halted by injunctions. Trade associations and consumer organizations found fair trade laws and regulatory legislation effective weapons against "big business."

The National Consumers League, among others, concluded that political action was a necessary supplement to its efforts at propaganda and negotiation. The Country Life Movement evolved into the Country Life Commission in 1908, while agrarian groups lobbied for the county agent system, agricultural extension, and government subsidies to agricultural education. The Women's Trade Association found that "political action, then, was required along with trade union activities to secure better conditions, a decent wage, a limit on hours and the right to bargain and organize without harassment." The Immigrants Protective League "urged that local and national governments take over tasks begun by private organizations." Settlement workers increasingly found that political action was necessary because "to keep aloof from it might be to lose the one opportunity of sharing the life of the neighborhood" and because "private beneficence is totally inadequate to deal with the vast numbers of the city's disinherited." The largely unorganized urban masses, caught in the grip of impersonal economic forces and under increasing pressure from nativists and restrictionists, urged their elected representatives on to greater efforts on their behalf.

Gradually, a number of fairly stable "coalitions" or "movements" developed around broad categories of issues: welfare legislation, the recognition of organized labor, taxation, business regulation, political restructuring, and cultural conflicts.

Launching the Welfare State

The launching of the welfare state in the form of workmen's compensation, old age pensions, factory codes, housing regulations, standards for child and female labor, and the like was primarily the work of three segments of society. The first was a sizable portion of the native middle class, particularly social scientists, clergymen, social workers, artists, and intellectuals. Their training and occupational experiences made them acutely aware of the existence of social evils. What percentage of the native middle class was so disposed—and precisely what differentiated them from the rest of that class—are still subjects for research. These reformers formed the social justice organizations, sought to educate other comfortable Americans to the need for public action, drafted legislation, and lobbied for its passage. Many became advisers to influential politicians or served on newly created welfare agencies.

Joining them often was organized labor, although the leaders were not all of one mind about welfare legislation either. Samuel Gompers and many of his associates feared government intervention and preferred collective bargaining to establish standards of labor, feeling that the legal minimums would ipso facto become the going rates. They were not the entire labor movement, however, and the American Federation of Labor (AFL) was a federation. State and local affiliates, especially those in the most populous states, and non-AFL unions generally took a more favorable attitude, exerting pressure on the national organization to follow suit. So, too, did the growing number of Socialists and such radical labor groups as the Industrial Workers of the World. By 1915 there was a debate on the floor of the national AFL convention between the followers of Gompers and those of William Green of Ohio, who, as a state senator, had sponsored a variety of welfare measures. As a rule, organized labor favored government programs for women, children, and the unorganized, while preferring that unions rely primarily on collective bargaining. Pragmatically, unions supported government intervention where they were weak and opposed it where they were strong.

The third, and numerically largest, group in the pro-welfare coalition was the great mass of urban industrial workers who stood to benefit most by ameliorative legislation. Many had come from a European tradition where government, guilds, churches, and landlords had assumed some responsibility for the welfare of the less fortunate. Foreign-language newspapers, especially in the Far West, often bordered on socialism in their outlook. Most immigrants had also experienced firsthand the horrors of the sweatshop and the tenement and had survived them largely through the ministrations of priests, politicians, social workers, and fraternal societies.

"The evidence suggests," as Herbert Gutman pointed out, "that awareness of poverty did not await its discovery by sensitive members of the middle and upper classes." Unorganized economically, urban immigrants possessed considerable political leverage because political machines depended upon them for support. The most important steps in the adoption of welfare legislation generally came in such key industrial states as New York, New Jersey, Ohio, Illinois, and Massachusetts at a time when the representatives

Although the Knights of Labor had all but vanished by the early 1900s, workers' ideals and pride in their trade carried over into the Progressive Era. Note the tools held by these carpenters. *(Catholic University of America)*

of urban political machines were clearly in charge. In many cases, the more sophisticated elements in the business community sought to blunt the impact of welfare legislation by designing their own measures and forcing a compromise. The vast majority of small businesses, however, remained adamantly opposed. The interaction of these groups on behalf of welfare legislation fully justifies the conclusion of June Axinn and Herman Levin that "the reform activities of the Progressive Era were spearheaded by many groups, some working cooperatively as particular issues warranted cooperation, some working for individual aggrandizement, some working altruistically for the larger society."

Establishing the Labor Movement

The same three groups generally shared the most earnest desire for the recognition of organized labor, although the middle-class contingent was significantly smaller. Welfare measures involved a kind of paternalistic concern for the less fortunate; unions opened the possibility that the lower classes could achieve enough power to plot their own destiny. Still, many native middle-class reformers did battle for labor in the difficult days of its infancy. Social worker Graham Taylor judged unions "the most practical bond of brotherhood next to the Christian Church," while Jane Addams insisted that unions were "the first real lesson of self-government—for the union alone has appealed to their necessities." Settlement workers usually hired only union labor, provided strikers with food and shelter, organized mass support for strikers, and often joined picket lines themselves. "At Hull-House," Alice Hamilton confessed, "one got into the labor movement as a matter of course, without realizing how or when." All factions of labor were, by definition, in favor of union recognition.

The urban political machines and their predominantly working-class constituencies were again the most politically effective segment of the pro-labor coalition. Most urban machine spokesmen had working-class backgrounds themselves and many union

officials ran for the city council and state legislature with organization backing. Urban representatives who were attorneys often got their start as labor lawyers. The leadership and membership of the nation's unions were largely drawn from the same ethnic stocks as were the representatives and constituents of the political machine. By 1911, the New York Federation of Labor was heading its honor roll with Tammany Hall politicians, while Boston's ward bosses agreed that "any hint from organized labor was enough to cause an order requiring action." Together with sympathetic members of the old-stock middle class, machine politicians and organized labor sought to outlaw blacklists and yellow dog contracts, to provide for jury trials for violation of injunctions, to require companies to admit whether they were being struck when advertising for workers, to label convict-made goods, to use the union label in government-issued products, and, above all, to establish labor's right to organize, bargain collectively, and strike.

Business was generally opposed to such notions and resisted them ferociously, although the most sophisticated financial capitalists, recognizing that strikes interrupted profits, preferred cooptation to confrontation. The National Civic Federation generally had a more favorable attitude toward unionization, as opposed to the National Association of Manufacturers, which had greater support among businessmen. Farmers, as employers of labor, usually shared corporate antagonism toward labor organization.

A Revolution in Taxation

Tax reform alignments depended largely upon the specifics of each proposal. Generally speaking, all social groups sought to throw the major share of the burden onto someone else. There was, however, a fairly general consensus that the wealthy holders of stocks and bonds were not paying their fair share because the existing structure relied upon real estate and excise taxes and customs duties. Revelations that the rich avoided taxes, coupled with the rising cost of living and increased governmental expenditures, aroused most segments of society to demand tariff revision and income and inheritance taxes.

Under the general slogan of taxes based on "the ability to pay," many diverse groups agreed on the broad outlines of "reform," while differing on the specifics. The urban middle class paid most of the property tax, consumed the lion's share of goods, and demanded better public services. They had the expertise and the erudition to popularize the need for change through tax reform associations. Farm spokesmen saw great advantages in shifting the burden from tangible property to intangible. The urban working class was also eager for better social services and happy to tax the rich. Professional politicians were anxious to supplement their extralegal sources of revenue—kickbacks, protection money, and assessment of payrollers—with more lucrative and predictable means. "The parties' assessment of jobholders and political candidates, the political levies against corporations and certain criminal businesses on the basis of their ability to pay," C.K. Yearley has concluded, "in effect, have been formally incorporated into state income taxes or into a variety of special taxes."

On the state level, tax struggles often took on an urban-rural cast, as the cities sought to stop the flow of money to the state capitol and increase their ability to tap their own wealth. On the national level, southerners and westerners were motivated by sectional feelings against the Northeast, even though the southerners and westerners wanted a "tariff for revenue only" and the Northeast a more equitable system of protection. The opposition to these changes was centered primarily in the 3 percent of upper income receivers who benefited by continuation of the existing tax structure; their ability to postpone and emasculate the new one is evidence of their political influence. The rich were often successful in obfuscating the issues by appeals to sectionalism and states' rights, by stigmatizing tax reformers as radicals, and by introducing such divisive issues as federal taxation of state and municipal bonds. Nearly every influential business journal in the nation was against the federal income tax, and business spokesmen who appeared before Congress were almost unanimous in their denunciation of both the tax and the Underwood-Simmons tariff, which provided for the reinstitution of a federal income tax.

Trust-Busting or Business Regulation?

The regulation of business is much more difficult to unscramble. Virtually every politically active group in the nation favored some form of regulation. Agrarian demands even antedated the Grangers and the Populists, while small-town merchants and bankers had an equally important stake in controlling the activities of those on whom they were dependent for transportation, financing, and processing. The urban middle class also favored regulation as part of its demand for adequate transportation and communication facilities,

as well as its desire to break up the graft-ridden connection between franchise holders and political machines. The foreign-stock working class in the nation's largest cities also pressed for better products and services at lower rates. Even big business developed a yen for regulation, especially by the federal government, in order to rationalize the system, and to eliminate uncertainty, competition, and the threat of state regulation.

The federal regulatory legislation of the Woodrow Wilson years may have been heavily influenced by those views, but pressures from other segments of the economy produced important compromises. State and local regulatory reformers could hardly have desired to nationalize markets. All of these groups disagreed over whether public ownership, regulation, or trust-busting was the best solution, as well as over specific provisions. The importance of any one social segment to the regulatory coalition varied over time and place. Regulatory laws resulted from the interaction of several or all of these groups, with business often diluting the provisions and "capturing" whatever commissions were established, such as the Interstate Commerce and Federal Trade Commissions.

New Political Directions

Patterns of political reform coalitions are particularly difficult to discern because the measures being proposed did not all go in the same direction. Moreover, virtually everyone employed such reforms as "instruments of political warfare," hoping that new devices would help outmaneuver opponents. Many proposals designed to free cities from the domination of rural legislators provoked a fairly clear split between the metropolis and the countryside, but small-town business alliances often operated to defend the political status quo. These same social and business elites, joined by a large portion of the native middle class, consistently sponsored "structural reforms"—civil service, at-large and nonpartisan elections, city manager and commission forms of government—which were intended to vest political power in experts free from popular control.

Although couched in democratic rhetoric, these proposals sought to centralize the method of decision making, leaving out "undesirable elements" of the population. The rosters of the Civic Clubs, Voters Leagues, and Good Government Associations read like the city's social and financial registers. Their adherents generally believed that "a city is a business corporation," and aimed for a government that "gives us our money's worth." Referenda on structural reform issues almost always resulted in heavy support in upper-class areas and overwhelming opposition in working-class districts, with the middle-class neighborhoods holding the balance. The enactment of structural reforms usually altered the makeup of city councils, replacing lower- and lower middle-class aldermen with professionals and businessmen. Statewide, such measures generally received the added support of rural and small-town lawmakers.

Historians find it difficult to believe that the same groups that sponsored these structural measures could also have favored the period's celebrated democratic reforms, such as direct legislation, primaries, direct election of senators, reapportionment, and woman suffrage. Many elitists favored woman suffrage in order to enfranchise upper- and middle-class native white women as a further bulwark against lower-class power, but many of the most prominent opponents of woman suffrage feared the threat of working-class women. Many foreign-stock people were actively hostile toward woman suffrage on cultural grounds, but a large portion changed their position in time to support the Nineteenth Amendment, due partly to a moderation of position by the suffragists.

The other democratic reforms split the middle class into those who trusted in the ultimate good judgment of the lower classes—or in their own ability to channel it—and those who did not. The urban working class had a clear self-interest in joining this coalition, one that their political mentors were at first slow to recognize but then strongly advanced. Direct legislation and primaries required the gathering of signatures, and the urban machines were better equipped than anyone to do that. Pressed by precinct and block captains, their constituents could be turned out in greater numbers at primaries than could rural or independent voters. Direct election of senators enhanced the chance of electing urban candidates. Organized labor also generally supported democratic reform, calculating that it would augment the working-class voice in government. In the South, small farmer groups, such as the National Farmers Union, backed certain democratic reforms as a device against Bourbon rule but opposed others out of dislike of the city.

Cultural Conflicts

The alignment on cultural issues was primarily an ethnoreligious one. Protestant Americans, whether in the city or the countryside, were the main advocates of Prohibition, Sunday blue laws, immigration restric-

tion, and drives against gambling and prostitution. Protestantism had freed the slaves and animated the Social Gospel, but it contained a darker side. Faced with the challenge of industrialization, urbanization, and immigration, many native Protestant Americans responded with campaigns to improve individual morality rather than confront broader social issues. For them the saloon, the gambler, the prostitute, and the foreigner replaced the sweatshop, the tenement, the trust, and the political machine as symbols of evil. It was that same outlook that caused Madison Grant to see in the new immigrant and the black man a common threat to Anglo-Saxon hegemony, causing many northerners to sympathize with the South's solutions of segregation and disfranchisement. Prohibition was largely an anti-immigrant movement in the North and an anti-Negro one in the South. In Oklahoma and the West, it was often aimed at the "red man" as well. Immigration restriction and forced Americanization were sponsored by a coalition of social workers, educators, superpatriots, and businessmen.

The coalitions that consistently opposed these efforts were a combination of the most traditional and liberal elements in society. The newer immigrant stocks, working with urban machine politicians, formed the largest segment of the coalition; their newspapers were as one in their denunciations of threats to personal liberty. Southern blacks were disfranchised first—then segregated and "reformed," so that they were able to offer little or no resistance. Many business leaders stood with the ethnic minorities on these issues because they saw the drives at liquor, gambling, and prostitution as illegal confiscations of property, and viewed free immigration as a source of cheap labor. Other businessmen, however, were enamored of Prohibition on the grounds of industrial efficiency and of immigration restriction when there was a surplus of unskilled labor. At the other end of the political spectrum were those academics and professionals whom education and experience had turned into hedonists or cultural liberals, uprooting them from the moralistic moorings of their youth. Although the national AFL did not openly condemn Prohibition until 1919, only 12 of its 186 city labor councils, 5 of its 46 state federations and 19 of its 111 craft unions ever endorsed the idea.

The evidence of referenda and legislative roll calls on cultural issues during the Progressive Era clearly mirrored these cultural divisions. In nearly all cases, they featured the upper and lower classes of the cities and some cultural liberals against the urban middle class and the rural populace. In most cases, these alignments cut across the socioeconomic and political reform coalitions that had been building and were a major factor in curtailing their effectiveness. A 1911 Prohibition vote in the California Senate split the normal reform coalition asunder, throwing many urban–labor–immigrant reformers into alliance with acknowledged pro-business conservatives. The coalitions that defeated an anti-saloon ordinance in Boston the same year consisted of the Back Bay and the Irish, Italian, Jewish, and black wards, predominating over the middle-class sections of the city. In a Chicago referendum on Prohibition, nearly all of the city's immigrant groups voted more than 80 percent against the measure, with only native Protestants, Swedes, and some blacks showing any real support. The only congressmen willing to stand against the final votes on Prohibition and the literacy test for immigrants were those with heavily new-stock constituencies.

Constructing Reform Agendas

It was out of their position in these various coalitions that individuals and organizations developed their reform agendas. Many eventually evolved formal programs, combining stands on several of these issues, while others simply responded to questions as they arose, leaving still others to discern meaningful patterns. Those who espoused structural political reform as a defense against the urban masses often coupled that with a proclivity for legislated cultural conformity, strongly opposed organized labor, and were lukewarm, at best, toward welfare measures. Those for whom welfare measures were the most pressing order of business often favored the recognition of labor and democratic political proposals, while fiercely opposing cultural uplift. The possible combinations and permutations were numerous; the likelihood of deviation from the general position because of the peculiarities of a single proposal clearly increased the complexity. Measuring individual reformers and groups against their usual positions on the broad categories discussed above, however, holds out the best possibility for determining what kind of "progressive" they were and what implications that term really had.

Individual politicians, contending factions, and political parties were thus faced with the task of constructing programs that appealed to members of several reform coalitions. Political platforms are notorious for being all things to all men, but there are certain reasonable limits. Even in the extravagant rhetoric of reform that characterized the day, it was difficult to appeal consistently to the proponents of both structural and democratic political change, to

both the advocates and opponents of legislated conformity, to both the supporters and the antagonists of labor and welfare measures.

The successful candidate, faction, or party in any given locale had to develop a platform with enough internal consistency to appeal to the membership of several compatible reform coalitions. This orientation naturally served the needs of certain socioeconomic, ethnoreligious, and geographic segments better than others and allowed these groups, temporarily at least, to impose their worldview on the rest of society. Their very success, however, generally aroused those with different outlooks who intensified their political activity and constructed a competing coalition and program. Each party started with a hard core of voters committed to it through habit and ethnoreligious or sectional tradition; broadening its constituency by appealing to issue-oriented independents or party switchers ran the risk of alienating a segment of original partisans.

Municipal Reform Movements

Reformers entered the political arena on the municipal level during the 1870s; their descendants were still laboring there forty years later. Their numbers were legion; their backgrounds, motives, goals, programs, and results myriad—and frequently contradictory. Many pursued multiple avenues of reform and appealed to a variety of constituencies. Some reformers were elected officials, and others were appointed to administrative posts, but the majority exercised influence through organized lobbying and electioneering efforts.

A large number of affluent, respectable reformers sought to solve urban problems by restructuring municipal government through the adoption of a strong mayor–weak council, commission, and city manager forms. Many of the same people also backed significant alterations in the electoral system through at-large, nonpartisan elections held at a different time from state and national contests, the short and secret ballots, tighter voter registration requirements, and the disfranchisement of "ignorant" and "corrupt" lower-class voters. They and other like-minded people often spearheaded anti-vice crusades designed to eliminate or control gambling, drinking, prostitution, pornography, motion pictures, stage productions, professional athletics, and other forms of "lewd" entertainment and recreation. A growing number of municipal reformers embraced the burgeoning city planning and "city beautiful" movements, and sought to suppress omnipresent water, air, and noise pollution. Others concentrated on housing regulation, stringent public health measures, improved public education, playgrounds and other child-care innovations, and more effective police and fire protection. Nearly every city of any size during the period was energized by drives to regulate the service and rates of gas, electricity, water, transit, and other "public utilities." Reformers in a number of cities even seriously pushed for the municipal ownership of various utilities.

Not surprisingly, the results of more than four decades of agitation for municipal reform were inconsistent. Even where "reformers" were apparently successful, these triumphs were often compromised significantly by the give and take of the political process, the resiliency of their opponents, and the seemingly inevitable erosion of reformist zeal on the part of the general populace. Much of the reason for the mottled outcome of municipal reform during the era, however, lay with the fact that cities were literally "creatures of the state." Their ability to deal constructively with their own affairs was severely limited by charters issued by legislatures that were all too frequently dominated by indifferent or hostile rural lawmakers, in collaboration with the state's most powerful business interests. Restrictions on the city's taxing, borrowing, and regulatory authority severely curtailed reformist efforts.

By the last decade of the nineteenth century, municipal reformers increasingly recognized the need to involve themselves in state-level politics and to lobby state government for various forms of redress. Their insurgency coincided with similar movements by agrarian activists; the combination led to an exponential increase of demands on state governments and escalating pressures to revamp their structures and operations. As a result, the first two decades of the new century were characterized by an unprecedented flurry of reformist activity, with New York, New Jersey, Wisconsin, Minnesota, Kansas, North Carolina, Washington, Oregon, and California gaining reputations as Progressive models and "laboratories of democracy." Except for the brief disruption by the Progressive Party in 1912—and for the activities of Socialist lawmakers in Wisconsin and a few other commonwealths—statewide battles between "Progressives" and their opponents were waged within the confines of the existing two-party system.

States as "Laboratories of Reform"

The most salient outcome of statewide Progressive reform was the tremendous expansion in the size, com-

plexity, scope, and cost of state government. Almost equally significant and widespread was the shift in emphasis from the "distribution" or "allocation" of divisible benefits to specific constituencies to more generalized functions of administration, regulation, and planning—and the consequent transfer of power from the legislative to the executive branch. In almost every state, government assumed a far greater share of responsibility for education, the conservation of natural resources, agriculture, the regulation of public utilities and other businesses, and the licensing of professionals, to name only the most obvious.

Many state governments also began to assume some responsibility for the welfare of some of their citizens by enacting workmen's compensation, industrial health and safety laws, housing codes, public health measures, mothers' pensions, wages and hours legislation, and standards for child and female labor. Although most of these efforts were inadequate to the need, they did establish important precedents that would be built upon at a later date. Many states also pioneered a "revolution in taxation" by shifting at least some of the burden from real estate and excise levies to income and inheritance taxes, in an effort both to provide revenue adequate to their expanded size and functions and to promote "tax equity." A large number also experimented with "drastic" changes in their political systems by adopting such innovations as woman suffrage, direct primaries, the popular election of United States senators, the Australian ballot, nonpartisan local elections, and initiative, referendum, and recall.

While "Progressives" almost universally proclaimed the democratizing inclination of such reforms, some saw them as devices for shifting political power upward—from the "ignorant," "corrupt" lower classes to more affluent, respectable citizens. Some "reformers"—principally, though not exclusively, in southern states—openly promoted the disfranchisement of African Americans, immigrants, and other "undesirables" through literacy tests, poll taxes, and restrictive voter registration laws. Whether or not they were intentionally designed to do so, the net result of the drive to make the political system more inclusive, accessible, and responsive was a precipitate drop in voter participation—especially among the lower social orders—that has continued down to the present day.

The National Arena

In most states, the Progressive Era reached its zenith between 1910 and 1914, about the same time that it peaked on the national level. Historians have traditionally begun discussions of the Progressive Era there with the elevation of Theodore Roosevelt to the presidency in 1901. Actually, Roosevelt dabbled in Progressive politics at all three levels of government, having served as police commissioner and reform mayoral candidate in New York City and as governor of New York State before being elected vice president in 1900. As president, he railed at the "malefactors of great wealth," promised a "square deal," cultivated his image as a "trust-buster," mandated arbitration in labor disputes, strengthened the Interstate Commerce Commission, helped enact the Pure Food and Drug Act, and set aside millions of acres of federal land for national parks.

Although he gave rhetorical support to tariff reduction, child labor legislation, and federal income and inheritance taxes, Roosevelt failed to follow through. Probably his greatest contribution to the cause of Progressive reform was his use of the presidency as a "bully pulpit" from which to make respectable measures formerly associated with Socialists, Populists, and other "radicals." As Roosevelt himself told a group of business leaders, his aim was to help "radicalism prosper under conservative leadership," so that "the progressive people will not part company with the bulk of the moderates."

Eschewing certain reelection in 1908, Roosevelt engineered the nomination of his friend William Howard Taft, who swept to an easy victory in the presidential race. More fundamentally conservative than Roosevelt—and far less politically astute—Taft had the misfortune of taking office at the precise moment when the long-simmering conflict between Progressive and "stalwart" Republicans was about to erupt into open warfare. The former, in the person of midwestern and western "Insurgents," challenged the eastern, business-oriented "Standpatters" on tariff reform, the enactment of an income tax, conservation of natural resources, and curtailing the power of the Speaker of the House of Representatives. When Taft sided with his party's eastern establishment on all of those issues, the Insurgents, led by Senator Robert M. La Follette Sr. of Wisconsin, formed the National Progressive Republican League in 1911, with an eye toward nominating a Progressive Republican for president the following year. With Taft clearly vulnerable and Roosevelt thoroughly disgusted with the performance of his hand-picked successor, the stage was set for Roosevelt to challenge for his party's nomination. When he failed to achieve that goal at the Republican Convention, Roosevelt bolted and orga-

As both governor and senator, Robert M. La Follette of Wisconsin advocated progressive reforms, such as primary elections, railroad regulation, and direct election of senators. Although he failed to get the Progressive Party's nomination for president in 1912, he won it in 1924 and captured almost 5 million votes. *(Images of American Political History)*

nized the Progressive Party, with himself as its presidential candidate. As one stalwart cynic observed, the only question left to be answered for the Republicans was "which corpse gets the most flowers."

The 1912 election was one of the most titanic in American history, and one in which the three "Progressive" candidates—Roosevelt, Democrat Woodrow Wilson, and Socialist Eugene Debs—garnered 77 percent of the popular vote and 523 out of a possible 531 electoral votes. The election supposedly turned primarily on the choice between two brands of Progressivism—Roosevelt's New Nationalism and Wilson's New Freedom—although the differences proved to be more rhetorical than substantive. The former president of Princeton University who had cultivated a reputation for Progressive reform as governor of New Jersey, Wilson was blessed—thanks to the Progressive–Republican split—with working majorities in both houses of Congress.

Directing the Democratic caucus with a firm hand, the first Wilson administration enacted an impressive array of "Progressive" legislation, including the Federal Reserve Act, the Federal Trade Commission, a federal income tax law, significant tariff reduction, the Federal Farm Loan Act, the Clayton Anti-Trust Act, the Keating-Owen Child Labor Act, the La Follette Seamen's Act, and the Adamson Act for railroad workers. Although few realized it at the time, Wilson's narrow reelection victory in 1916 proved to be the denouement of the Progressive Era nationally. Although his second administration produced the Eighteenth and Nineteenth Amendments, the energy that had sustained reformist efforts for over a quarter century was largely dissipated or displaced. In an almost complete reversal from the election of 1912, conservative Republican candidate Warren G. Harding—who promised to return the country to "normalcy"—received over 60 percent of the popular vote and three-fourths of the electoral vote.

Disintegration and Decline

It was the fragile and transitory nature of coalition politics and the difficulty of sustaining a cooperative mood among different social groups that ultimately brought an end to the Progressive Era. Although they staked out broad areas of agreement and frequently cooperated on concrete reforms, any more permanent alliance between the old-stock, Protestant middle class and the new-stock, non-Protestant lower classes was foreclosed by a fatal inner tension. Distrust arose fundamentally because the middle-class reformers were engaged in uplifting others while the lower classes were concerned with self-improvement. The middle class held up its values and lifestyles as models to be emulated, while the lower classes wished to be highly selective about what they adopted. The exact date of the rupture varied from place to place; in several states, reformist momentum was spent as early as 1914.

Elsewhere, disintegration was triggered by World War I. The issue of American participation in the war drove deep fissures into the ranks of those who had cooperated on other issues. Even among middle-class social reformers there were some who continued to protest the war, while others gave their enthusiastic support. The antiwar Germans, Irish, and Scandinavians clashed sharply with the pro-war Poles, Czechs, and Slavs. Moreover, Wilson made the fatal, though understandable, mistake of couching the war in the rhetoric of Progressivism. When it failed to produce a safer or more just world, the result cast doubt upon domestic reform as well. "By pinning America's role in the war so exclusively to high moral considerations

and to altruism and self-sacrifice," Richard Hofstadter insisted, "by linking the foreign crusade as intimately as possible to the Progressive values and the Progressive language, he was unintentionally insuring that the reaction against Progressivism and moral idealism would be as intense as it was."

The greatest disillusionment came among the professionals and intellectuals who shared Wilson's aspirations. Shocked by the horrors of war and the failures of the peace conference, many of them took refuge in elitism and campaigns for personal betterment. For many, the war unleashed an irrational fear of radicalism and social protest. The atmosphere that had made the muckrakers' attacks seem so exhilarating disappeared under the watchful eye of the Committee on Public Information and the Red Scare. The Wilson administration's shoddy record on civil liberties disaffected the major libertarian organizations, further disintegrating the coalition that had upheld the New Freedom. It also alienated untold numbers of ethnic minorities who had traditionally supported the Democratic Party, laying the groundwork for the electoral disasters of 1920 and 1924.

More comfortable Americans also developed a growing fear of the potential economic and political power of the urban working class. Even those middle-class reformers who had backed labor and welfare measures earlier harbored doubts about the goals of the labor movement. Settlement workers wanted social justice for the working class, but not at the expense of the violence and disturbance of the peace that often accompanied strikes. "It is only occasionally that I get a glimpse of the chivalry of labor," Jane Addams remarked to a friend; "so much of the time it seems so sordid."

The rash of strikes that followed the end of the war frightened all but the most diehard middle-class supporters of unions. "Everywhere," a contemporary student of the Wilson administration's labor policies noted in 1920, "labor representatives are presenting new and greater demands and many defenders of the status quo fear the unleashing of disintegrating forces." The government's National Industrial Conference to promote business–labor cooperation in 1919 broke up in mutual animosity over compulsory arbitration, the prohibition of strikes, and other issues. Agrarian reformers grew similarly fearful, with some charging that "farmers are suffering more now from the leaders of labor than from the leaders of industry or finance." Many middle-class reformers also grew uneasy as the lower classes pressed for more sweeping welfare measures, such as health and unemployment insurance.

Mostly, though, coalition politics perished on the shoals of cultural reform. As urban and rural old-stock Protestants devoted more attention to legislated morality, the gap between them and the new-stock working class grew greater. The reform coalitions eventually conceded to the issues of Prohibition, immigration restriction, and Sunday blue laws: The National Conference of Social Work endorsed Prohibition by 1917, hailing it as the ultimate solution to poverty, prostitution, crime, and industrial inefficiency. When Congress passed the literacy test over Wilson's veto in 1917, not even the Immigrants' Protective League raised much protest. The foreign-stock working class was forced into a necessary alliance with business-oriented conservatives who opposed Prohibition and immigration restriction on economic grounds. Prohibition helped destroy previously effective reform coalitions in Kansas, California, and Colorado, while immigration restriction and Americanization became increasingly attractive to many native middle-class reformers. Many made the journey from reformers to militant Americanizers and spokesmen for the "welfare capitalism." Some new-stock reformers became so distrustful of government intervention into their lives that they even temporarily lost their enthusiasm for welfare measures and opposed the national child labor amendment and federal aid to education. These cultural issues destroyed the socioeconomic and political coalitions that had been so carefully constructed in earlier years.

The Legacy of Progressive Reform Movements

The Progressive Era was a seminal period in its attempts to cope with the implications of living in an urban, industrial, multicultural society. Would-be reformers from many walks of life advanced solutions to the nation's problems that—first and foremost—served the particularistic needs of the members of that movement. Although many sought redress through private action, nearly all eventually turned to political action. This widespread consensus that the state should actively promote social justice clearly marked the period off from earlier ones and established a precedent for future reformers. Under the pressures of political necessity, reform movements of all sorts were forced to compromise, coalesce, and cooperate to achieve positive legislative results. By this process they established a framework in which profound

social change in a pluralistic society could be assimilated.

The very nature of that process has undoubtedly inhibited the nation's response to modernization down to the present day, by placing a premium on compromise, conciliation, and consensus. It has necessitated an emphasis on "incremental adjustments" rather than sweeping or comprehensive change, generating politicians "who learn to deal gently with opponents, who struggle endlessly in building and holding coalitions together, who doubt the possibilities of great change, who seek compromises." Whether a nation as large and diverse as the United States could have responded to the massive social transformations of the late nineteenth century in any more radical manner without major alterations in its political system is certainly open to serious question. Whether any more fundamental alterations were possible in a society so socially and culturally fragmented—lacking a genuine national identity and culture—is even more questionable. It is that process—rather than any specific reform measures—that constitutes the most important legacy of the Progressive Era.

Eugenics Movement

The American eugenics movement, along with its counterparts in European as well as Asian nations, sought to engineer a "better" population through the science of human heredity. Eugenicists correlated biology with social fate: they assumed that a hierarchy of ethnic groups existed and that mental, physical, and behavioral characteristics were primarily hereditary, rather than environmental, in cause. Fearful that the "quality" of the population was declining because the genetically "unfit" were having more children than the "fit," the movement's advocates encouraged procreation among the fit (positive eugenics) and discouraged procreation, sometimes forcefully, among the unfit (negative eugenics).

American eugenicists did gradually come to realize that individuals with "good" traits were spread throughout society, but they predominantly focused on the group, not the individual, and their definitions of quality were determined by the norms of their upper-class society. "Fit," in other words, was largely a corollary for the fair-skinned middle and upper classes.

The movement was never popular among the larger public, though its central idea—the concern with differential fertility among ethnicities and social classes—was at least casually supported by many educated, white Americans. The organized movement declined in the 1930s, despite efforts to tame its doctrine to allow a role for nurture as well as nature, and was then nearly killed off by the public's recognition of the links between Nazism and eugenics. A sanitized eugenic ideology lingered into the postwar United States, and the revolution in human genetics revived eugenic goals of manipulating the population that still echo today, but the American eugenics movement must ultimately be labeled a failure.

Historical Roots

Charles Darwin's theory of evolution was the intellectual cornerstone of the trans-Atlantic eugenics movement. In *The Origins of the Species* (1859), Darwin argued that species evolve through "natural selection," a "struggle for existence" in which reproductive success is determined by heritable differences. Eugenics was born in 1860s England when Sir Francis Galton, a cousin of Darwin concerned with the declining birth rate of the upper classes, applied statistical methods to the study of heredity to create what he hoped would become a new secular religion of scientific breeding. (He later coined the term "eugenics" from the Greek word for "good in birth.") Eugenic thought grew in the last third of the nineteenth century with Social Darwinism, the intellectual movement that sought to apply Darwin's model of natural selection to human society.

Eugenics and Social Darwinism shared a basic evolutionary outlook. Yet while Social Darwinists argued that society should not interfere with the struggle among social groups, eugenicists hoped to "speed up" and improve upon natural selection by influencing who gave birth. Unimpeded natural selection implied chaotic breeding followed by destruction, but eugenics promised to bring into the world only superior individuals. "If farmers could breed better plants," Galton wondered, "Could not the race of men be similarly improved? Could not the undesirables be got rid of and the desirables multiplied?" His *Hereditary Genius: An Inquiry into Its Laws and Consequences* (1869) argued that the superior came from only a few families and previewed his Law of Ancestral Heredity, which held that characteristics (ranging from eye color to intelligence) were inherited in an orderly, linear fashion. Karl Pearson, Galton's principal successor, preferred science to action, but the two jointly advanced and promoted the infant science of "biometrics," the statistical study of human characteristics and inheritance.

Galton and Pearson's work and prescriptions gained a smattering of acceptance among American scientists and philanthropists, but two major precon-

ditions were required before eugenic thought would gain momentum during the first decade of the twentieth century. The first was the development of a new evolutionary paradigm, which, unlike Darwin's theory of natural selection, greatly privileged heredity over environment and hence forged a temporary alliance between science and eugenics. The triumph of hereditarianism was a multistep process. Galton's theories of inheritability had actually been out of step with the ruling theory of evolution in the late nineteenth century neo-Lamarckism, which held that evolution involved the adaptation of organisms to their environment and that characteristics acquired during the lifetime of an organism could be passed on.

By insisting on the biological transmission of acquired characteristics, neo-Lamarckism blurred the distinction between heredity and environment and laid the groundwork for the triumph of heredity. The next major development in the theory of evolution, the German scientist August Weismann's overturning of neo-Lamarckism in the 1880s and 1890s, continued the trend toward hereditarianism. Weismann's germ plasm theory divided the body into germ cells, which transmitted hereditary information, and somatic cells, which did not. His work thus suggested that many traits were not inherited, but his discovery that changes accumulated during the lifetime of an individual organism were not passed on to the germ cells of the next generation was taken by many as endorsement of the ultra-hereditarian position.

Finally, around the turn of the twentieth century, American and European scientists rediscovered the forty-year-old experiments with the breeding of peas by Gregor Mendel, an Austrian monk. Mendel had identified dominant and recessive genes (what he called "unit characters") and argued that traits either appeared or did not appear; and the new Mendelians demonstrated that some human traits (e.g., color-blindness) indeed worked according to Mendel's binary model. They forged a consensus that the mechanism of evolution was mutation rather than natural selection, or the ability of organisms to pass on acquired characteristics. American eugenicists not trained as biologists may not have understood the finer points of Mendel's work—indeed, his theories allowed for a complex relationship between environment and heredity—but they seized on the notion that traits could be reduced to a single gene. For the first third of the twentieth century, American eugenicists would largely ignore advances in genetics in favor of a biological determinism that explained nearly all human actions and characteristics in terms of simple Mendelian unit characters—and which therefore held that only biological manipulation, not environmental reforms, could enhance the "quality" of the population.

Race, Ethnicity, and Eugenics

The second precondition was the tumultuous transformation of American society in the years surrounding the turn of the century—and the perception that deficiencies in groups rather than individuals accounted for many social ills. American eugenic ideology was shaped by concerns surrounding race, gender, and class; and the rise of mass immigration, urbanization, and industrialization reinforced anxieties in each of these three areas. The science of identifying "races" (which claimed the superiority of the "white race") had been popularized in the years following Darwin and reinforced traditional American racism. Confronted with a falling birthrate among native-born, "white," middle-class Americans (the result, many argued, of the selfish attitudes of the city-dwelling "New Woman") and higher birthrates among the newer immigrants from Southern and Eastern Europe, many elite individuals, including Theodore Roosevelt, warned of a pending "race suicide." In a society with increasing ethnic and economic divisions, eugenics also provided members of the upper classes a biological justification of their status. It was a social ideology with (supposed) scientific support.

Eugenics was also a multidisciplinary enterprise. The natural sciences led the way—a committee of the American Breeding Association became the first eugenics organization in the nation—but scholars in several fields contributed to the vogue. Eugenic explanations appealed to some psychologists and psychiatrists seeking to find the roots of deviance. For example, the psychologist Henry Goddard, who ran a school for the "feebleminded" in New Jersey, published a flawed but influential study of the offspring of one man called *The Kallikak Family: A Study in the Heredity of Feeble-Mindedness* (1912). It assumed that mental capacity was a single genetic trait, and it purported to show how the nation could be swamped with degenerates and "morons" (he coined the term) within a few generations. Eugenic research institutions grew as well.

The leading early American eugenicist was the biologist Charles B. Davenport, who with support from the Carnegie Institution founded a research station in 1904 at Cold Spring Harbor, Long Island. In 1910, the Harriman railroad fortune bankrolled the creation of

the nearby Eugenics Record Office, which served as a clearinghouse for genetic information via the thousands of family-trait histories mailed to it. Still, one must be careful not to exaggerate the reach of the eugenics movement. Without contemporary polling data, the exact amount of support for the movement in any segment of society cannot be precisely gauged, but it is safe to assume that, although only a small minority of American natural and social scientists was in vocal opposition, an even smaller minority was in active support. Most professionals were either indifferent or bound by a code of professional ethics not to criticize colleagues. And many geneticists shied away from the eugenic debate because eugenic organizations were a source of grant money.

American Eugenics Society

Hereditary organizations, with membership based on genealogical purity, had existed since the late nineteenth century, and now more explicitly eugenic societies sprang up in dozens of cities. The first incarnation of the national American Eugenics Society was founded in 1910. Membership never exceeded 1,200—a small number by any measure—but its membership of elite businesspeople, social activists, philanthropists, and scientists did afford it, for a time, a modest amount more influence than its size suggested.

Among the movement's first generation of leaders was David Starr Jordan, the first president of Stanford University, and luminaries such as John D. Rockefeller Jr. and George Eastman provided financial aid. Eugenic groups sought to make the public "eugenic-minded" by sponsoring "fittest family" contests at state fairs, successfully lobbying for the addition of eugenics into college curriculums, canvassing the lecture circuit, and participating in international eugenic conferences. World War I also buttressed the movement. Concerns with the quality of the population grew when childless youth in their prime went to fight; and eugenicists, including Goddard, aided the army in developing intelligence tests for soldiers, the results of which further reinforced the eugenic belief in the dominance of nature and the inferiority of nonwhites.

The Movement's Diverse Strands

The majority of Americans had little knowledge of the eugenics movement, though many nonwhites knew that it constituted a threat. For a time many elite Americans did consider eugenics a reputable, if somewhat odd, reform movement, in large measure because the movement's unifying ideas of evaluating social problems in biological terms and reforming society by modernizing procreation were malleable enough to attract support from a variety of constituents. The outlook of eugenicists ranged from the utopian to the reactionary.

Radicals did not generally support the movement because of its early insistence that women adhere to traditional roles of childbirth and mothering (that is, serve as "race mothers"). However, some did find common ground in the movement's lack of religiosity and in its assertion that unregulated capitalism made the cost of children prohibitive to the middle classes and hence damaged the gene pool. Whereas mainstream eugenicists before the 1930s tended to be anti–birth control, advocates for legalized contraception, including Margaret Sanger, used the eugenic argument that spreading access to birth control to the lower classes would improve the quality of the population.

Eugenics was also popular in the conservative, racist wing of the Progressive movement, the umbrella term for the diverse efforts to tame industrial capitalism in early twentieth-century America. Progressives and eugenics overlapped in their calls for the scientific management of society, their desire for efficiency (eugenics would reduce the taxpayers' bill of caring for the poor and disabled), and their belief that individual decisions (e.g. childbearing) should be subordinated to the needs of the greater society. Finally, racist conservatives such as Madison Grant, author of the influential *The Passing of the Great Race; or, The Racial Basis of European History* (1916), hoped above all that eugenic measures would preserve America as a "Nordic" nation. Despite the diversity of political opinion, the vast majority of eugenicists were middle- to upper-class European-American Protestants who tended to equate "good traits" with those of their dominant group.

Target Populations

Beyond increasing societal concern with the "quality" of the population, the American eugenics movement achieved specific success in two major policy areas: sterilization and immigration restriction. Most eugenicists believed in the basic preservation of voluntary decisions surrounding marriage and childbirth and hence merely urged people to think eugenically. Even the most fervent realized that revolutionary selective-breeding policies, for example, requiring a license to give birth, were unlikely to emerge. However, in the case of those they deemed severely disabled or "fee-

On March 10, 2000, Sarah Jane Wiley stands in the operating room in which she was sterilized forty-one years earlier in the Virginia Colony for the Epileptic and Feebleminded in Lynchburg. Wiley and her brother were among the thousands of Americans sterilized without their consent in the name of eugenics. *(AP Wide World Photos)*

bleminded," which they considered a genetic trait, they sought to actively prevent procreation through involuntary sterilization. As a result of eugenicists' lobbying as well as a broad societal consensus, between 1907 and World War II more than half the states enacted laws permitting the involuntary sterilization of the "feebleminded."

The targets of sterilization were generally the mentally ill, but "feeblemindedness" was a flexible category; thus, sexual promiscuity and other forms of "immorality" were often grounds for sterilization. The belief in the biological origins of social behavior sometimes made criminals targets, too. The vast majority of those sterilized were poor, and in at least one state (Virginia) nearly half were African American. In *Buck v. Bell* (1927), the U.S. Supreme Court upheld Virginia's sterilization law, Justice Oliver Wendell Holmes declaring, "three generations of imbeciles are enough." Separately, the eugenics movement contributed to passage of the 1924 Johnson-Reed Act, which adopted racial quotas for immigrants that largely closed America's borders. The Congressional Dillingham Commission on Immigration, which reported in 1910–1911, used eugenic research to report that immigrants were less intelligent than the native-born, and Harry H. Laughlin, Davenport's assistant at Cold Spring Harbor, made similar arguments while serving as "Expert Eugenical Agent" to Congress in the early 1920s.

Opposition and the Movement's Decline

Criticism of the movement widened in the 1920s and into the 1930s as the temporary triumph of nature over nurture crumbled on many fronts. The vast ma-

jority of a new generation of geneticists, led by Herbert Jennings, rejected the movement's spurious biology—its simple, like-produces-like model of inheritance as well as the racism embedded in eugenic research. They noted that given the nature of recessive genes, meaningfully reducing the occurrence of any physical or mental deficiency (even the few that could be definitively identified as solely genetic in cause) would take hundreds of years.

Further developments in population genetics in the late 1930s and 1940s, particularly recognition that a species displayed a range of characteristics, cemented the break between eugenics and science. In addition, the fields of anthropology and psychology, which had adopted the stress on nurture in the early twentieth century, turned toward an environmentalist approach and further eroded acceptance of biological determinism. The major foundations eliminated their support for eugenic projects, and, in 1935, the American Neurological Association issued a report rejecting the genetic rationale for sterilizations. Religious groups stepped up their campaign against the assumption that some individuals were superior to others. As the 1930s progressed and a better understanding of the Nazi regime emerged, American eugenicists' links to the regime (indeed, parts of the 1933 Nazi eugenic law were modeled after California's sterilization law) significantly tarnished public opinion of the movement. Eugenics had become both a flawed moral endeavor and a stigmatized science.

In response to declining institutional strength and legitimacy, the eugenics movement tried to save itself in the 1930s by softening its rhetoric. Leadership shifted to a loose coalition of "reform" eugenicists, led by Frederick Osborn, a retired financier who broke with his uncle, a paleontologist at the New York Museum of Natural History and virulently racist eugenicist. Reform eugenicists maintained the desire to use the science of heredity to improve the quality of the population, but they at least claimed to recognize a role for nurture as well as nature and to emphasize differences among individuals rather than between groups. Rejecting many eugenicists' earlier preference for pure science over propaganda, they also articulated lofty social reform goals.

Osborn believed that the goal of the eugenics movement was to maintain a sufficient quantity of men of sufficient quality as a means of improving civilization. Women were still expected to perform traditional roles, but support for birth control and the right to sexual satisfaction grew. (Indeed, eugenicists now assured leery doctors that sterilizations were not "unsexing.") In short, the movement now tried to create a democratic eugenics far removed from totalitarian racial science.

The reform-eugenic project transformed and simultaneously ensured the survival of the core concerns of the movement, but it was ultimately both a hollow intellectual endeavor and ineffectual in influencing social policy. Eugenicists had blended into the maturing American demography profession, which thus declared its intentions to research both the qualitative and empirical components of the population even as it strove to remove the taint of eugenics from population science. When in the 1930s eugenic-demographers and other social scientists instigated an unsuccessful campaign for a comprehensive American "population policy," the concern with quality remained alongside the concern with quantity (demographers now falsely predicted a future decline in the aggregate population) and the concern with the geographical imbalance between people and industry.

Many planks of the ideal population policy, such as improved public health and a downward redistribution of income through tax and spending measures, were nearly indistinguishable from other New Deal–inspired blueprints for social reform. "Quality" no longer connoted the germ pool so much as the health and welfare of the population. Still, the drive for population policy was very much a positive-eugenics campaign. The hope was that equalizing environmental conditions would make children more affordable for the "better" families in the middle classes. In addition, although there was a new recognition of the effect of social inequalities on "quality"—some even stressed that economic redistribution would prove that the genetically superior could be found in all socioeconomic groups—many eugenicists remained unable to shed the idea that class and ethnicity were reasonably accurate predictors of biological quality. Finally, while eugenicists publicly emphasized the campaign to extol the virtues of motherhood and large families, negative eugenics actually thrived. About 9,000 Americans had been sterilized between 1907 and 1928; by 1941, the number had reached 36,000.

Survival of Eugenics

Full revelation of the horrors of Nazism discredited eugenics in postwar America. Sterilizations sharply decreased, and the organized movement dwindled to almost nothing, despite its promise to seek improve-

ment of only the human race as a whole. Nonetheless, eugenic ideas did not disappear in postwar America. Concerns with the quality of the population were embedded in the 1950s vogue for family values and child rearing; and eugenicists from the 1930s reemerged as leading figures in the marriage counseling movement. A eugenic discourse of quality was also present in the development of family-planning programs in the Third World designed to address the population explosion.

Although the field of human genetics made every effort to separate itself from its eugenic heritage, the discovery of DNA, better identification of genetic disorders, and the concomitant promise of "genetic engineering" through prenatal screening and later artificial insemination also fostered a revival of eugenic goals. Herman Muller, a geneticist who had advocated a socialist eugenics in the 1930s, led the new movement for "germinal choice"—artificial insemination after freezing the sperm for a long period of time so that the quality of the donor could be properly measured. After his death in 1967, a sperm bank with his name was established that initially accepted only the sperm of Nobel laureates. Finally, the "white backlash" that emerged in the late 1960s in response to the civil rights movement and the rise of Affirmative Action also permitted a brief revival of neo-eugenic ideas in educated circles. Most famously, a 1969 *Harvard Educational Review* article by Arthur Jensen suggested that genetic differences were perhaps a contributing factor in the gap between African-American and white test scores.

Yet social critics and historians have perhaps been too eager to find the contemporary "legacy" or "survival" of the eugenics movement. The germinal choice movement was inconsequential, and the current fear over the cloning of humans seems to indicate that serious efforts at eugenic reproduction are highly unlikely. True, many Americans continue to fear that certain groups will have more babies than others; and some social scientists occasionally resort to crude biological determinism. For example, the widely debated and refuted book *The Bell Curve: Intelligence and Class Structure in American Life* (1994) by Herrnstein and Murray argued that success in America is largely determined by supposed innate differences in intelligence among social classes and ethnicities. In addition to using spurious research funded by racist organizations, the book contained several methodological errors, including falsely assuming that intelligence is reducible to a single number and is unresponsive to environmental shifts. Still, garden-variety American racism preceded the eugenics movement, and the continued strength of racism should not be seen as evidence of the residual strength of the eugenics movement. Even during the movement's heyday in the early twentieth century, eugenic ideas were just one element of a larger concern with social, mental, and racial hygiene, and by the third decade of the twentieth century they were already in decline.

Today eugenics is important not as an ideology or as a movement but as a weapon—a tool to stigmatize certain groups and ideas that, according to their critics, have overreached in their pursuit of manipulating the population. For example, advocates of stringent birth control measures (such as paying young women not to have children) have been called eugenic by minority groups. To be sure, echoes of eugenics can be found in several social policy debates, such as those related to social benefits. (The image of the "welfare mom" incorporated fears that the poor were outbreeding the nonpoor.) Eugenic ideas, grounded in traditional bias and tantalized by the coming mastery of the human genome (misunderstood by many as the promise of once again discovering single genes that account for complex traits), seem unlikely to fade away entirely. However, given America's almost universal acceptance of at least formal racial equality, the rise of individual civil liberties, and widespread fears of genetic experimentation, a new eugenics movement seems unlikely.

Alcoholics Anonymous

Alcoholics Anonymous (AA) is a voluntary, mutual-help movement comprised of recovering alcoholics devoted to aiding still suffering alcoholics overcome alcohol addiction. Since its formation in 1935, few organizations, public or private, have rivaled AA's impact on prevailing conceptions of alcoholism and addiction treatment. During its history, AA has grown from a fledgling movement of 100 to 1 million members in the United States and over 2 million members worldwide. With its success in helping alcoholics, AA's conception of alcoholism and addiction treatment has become the predominant model of professional treatment in the United States. As early as 1939, AA members were actively aiding hospitals in the treatment of alcoholics. By 1957, AA members were present in over 250 hospitals nationwide. Today, there are few treatment programs that do not treat alcoholism as a disease and employ some part, if not all, of AA's Twelve Step practices in their treatment program. Besides alcoholism treatment, the Twelve Step approach to life change has been adopted by numerous mutual-help groups to address problems ranging from gambling and sex to overeating and emotions. Underlying each of these movements is a practice of mutual help where members help themselves recover by helping others do the same.

Despite its widely recognized impact on conceptions of alcohol addiction and treatment, AA is not often considered as a social movement because it defies ordinary divisions, classifications, and distinctions within social movement theory. In part, the classificatory difficulties are created by AA's self-described relation to wider social practices. Unlike social movements that explicitly or implicitly identify their aims with socioeconomic or political change, AA recognizes only one purpose for its membership: to aid other alcoholics in abstinence. Some scholars classify AA as a self-help movement to highlight the fact that members seek help for addiction problems that they believe cannot be cured through existing social institutions. According to this view, members seek help from others with similar difficulties rather than professionals who specialize in aiding them. Other scholars classify AA as a mutual-help movement to stress the ways that members cooperatively aid one another and engage in a practice of helping themselves through helping others. Each of these classifications adds a dimension to understanding AA as a social movement, but difficulties remain. Since official AA literature endorses strict rules of nonaffiliation, organizational autonomy, and the singular purpose of helping alcoholics, there is little explicit clarification of AA's social aims in its official self-descriptions.

The most substantial effort to understand AA as a social movement is Robin Room's article entitled "Alcoholics Anonymous as a Social Movement," which suggests that AA is a mutual-help movement aimed at personal rather than social transformation. Drawing on AA's organizational principles, commonly known by members as the Twelve Traditions, Room interprets AA as a social movement by focusing on AA's self-described organizational structure and complex pattern of relating to wider social practices. Unlike the Twelve Steps that guide members in overcoming their addiction to alcohol, the Twelve Traditions guide AA groups on internal policies and external relations. For example, AA promotes an open membership policy as expressed in tradition three, which states that "the only requirement for AA membership is a desire to stop drinking." Membership requirements in the traditions correlate with AA's primary mission to help suffering alcoholics. In addition to open membership policies, AA traditions also stress the primacy of group independence and financial self-sufficiency, prohibitions against external affiliations or property ownership, and external anonymity. Each of the aforementioned policies is a distinctive feature of AA and provides a helpful lens by

TWELVE STEPS

1. We admitted we were powerless over alcohol—that our lives had become unmanageable.
2. Came to believe that a Power greater than ourselves could restore us to sanity.
3. Made a decision to turn our will and our lives over to the care of God as we understood Him.
4. Made a searching and fearless moral inventory of ourselves.
5. Admitted to God, to ourselves and to another human being the exact nature of our wrongs.
6. Were entirely ready to have God remove all these defects of character.
7. Humbly asked Him to remove our shortcomings.
8. Made a list of all persons we had harmed, and became willing to make amends to them all.
9. Made direct amends to such people wherever possible, except when to do so would injure them or others.
10. Continued to take personal inventory and when we were wrong promptly admitted it.
11. Sought through prayer and meditation to improve our conscious contact with God as we understood Him, praying only for knowledge of His will for us and the power to carry that out.
12. Having had a spiritual awakening as the result of these steps, we tried to carry this message to alcoholics and to practice these principles in all our affairs.

which to understand AA's relation to wider social norms. For instance, early AA members realized the importance of anonymity for individual members and AA as an organization. Thus, in press reports, members went by first name and last initial in their self-identifications. In film, members covered their faces with a mask or some other way to conceal their identities. Early experiences taught members that anonymity secured the trust of new recruits, insured member confidentiality and avoided the negative impact of members who might fall off the wagon and damage the AA name.

Analysis of the traditions reveals much about AA as a social movement, but Room's approach leaves a crucial tension between AA's helping-others practices and its organizational principles unexplored. Although it is true that the Twelve Traditions are a barometer for assessing AA's internal policies and its relationship to wider networks, focusing on the Twelve Traditions misses fundamental points of contact between central AA practices and wider social practices. Most notably, a central feature of AA membership is the practice of helping-others or what is referred to as "Twelve Step work." Practices aimed at helping-others often include hospital visits to alcoholics in rehabilitation clinics, meetings at prisons or detoxification centers, and promoting the abstinence practices of AA. Attempts to understand AA as a social movement apart from this "Twelve Step work," obscures the significant degree of interaction between AA members and wider social practices and networks of alcohol treatment activities. By limiting his analysis to the traditions, fundamental practices and sources of AA's development and character as a movement are minimized.

Context of AA's Beginnings

Pre-AA Treatment for Alcoholics

Pre-AA approaches to aiding alcoholics vary widely over the 220-year history of helping alcoholics in the United States. Undoubtedly, a careful study would elaborate the varying conceptions of alcoholism and sources, whether moral, religious, or medical, that contributed to these conceptions. Although aid to alcoholics has taken different guises, the advocates of helping alcoholics have all shared some basic ideas and aims. Most notably, helpers view alcoholics as powerless over alcohol in such a way that requires some sort of intervention (whether religious, moral, medical, or political) to cure their alcoholism. In this respect, the conception of alcohol and alcoholism presented by AA is unique in its approach to alcoholism, but shares significant affinities with previous notions of helping alcoholics. Dr. Benjamin Rush, a signer of the Declaration of Independence, was among the early advocates of helping and aiding alcoholics. Unlike many of his contemporaries, Rush forwarded the idea that alcoholics were powerless over their drinking habits and needed help in overcoming their drinking as early as 1774. In response to the problems of alcoholism, Rush proposed the establishment of a "sober house" where alcoholics would be rehabilitated through religious and moral education.

In addition to professional helpers, attempts to aid alcoholics also emerged in the temperance movements, which aimed to help alcoholics by requiring their members to pledge to refrain from drinking dis-

tilled spirits and attend temperance gatherings. In addition, the temperance societies often provided public information regarding alcohol and its impact on health. Initially, temperance supporters advocated pledges to moderate drinking; but by the middle of the nineteenth century, temperance supporters began to advocate total abstinence either through an individual's pledge or government-backed prohibition. The shift in policy resulted from numerous causes, including the rising number of alcohol-related difficulties facing the early republic and the general sense among temperance advocates that alcoholics could only overcome drunkenness through total abstinence.

A temperance movement of particular significance to AA's historical consciousness is the Washingtonian movement. The Washingtonians advocated total abstinence, held regular meetings where members shared their experiences with drinking and abstinence, and provided service to others. By 1842, when the Washingtonians were at their peak, over 600,000 pledges had been signed and its speakers lectured across the country. In addition, the Washingtonians engaged in political action and aimed at social change. Early members of AA suggested that the Washingtonians splintered and failed when they directed their energies toward the social and political features of the temperance movement and lost their singleness of purpose. Although the AA founders often looked to the Washingtonians for lessons, it is likely that other mutual-aid groups devoted to alcoholism influenced early AA members, including the Emmanuel Movement and the Jacoby Club, which described itself as "A club for men to help themselves by helping others."

Oxford Group Movement: Beliefs and Practices

The Oxford Group Movement (OGM) was one of the most significant influences in shaping AA's approach to aiding problem drinkers. Unlike temperance movements and other alcoholic help strategies, the OGM never focused on the problem of alcoholism. Instead, they focused on the problems of sin and viewed alcoholism as an effect of an underlying sinful condition. Early members of AA, including both cofounders, attended OGM meetings in their efforts to quit drinking.

Founded by Frank Buchman in 1908 as a Christian revival movement, the OGM employed personal evangelism practices or what adherents sometimes called soul surgery. Personal evangelism aimed to induce a conversion experience sufficient to overcome an individual's struggle with sin. Through personal evangelism, OGM adherents believed that they were aiding others in living a Christian life by overcoming sinful living. Personal evangelism practices were not unique to Buchman and his followers. Henry Drummond, Dwight L. Moody, and John Mott employed similar methods in their revival efforts. In fact, Buchman most likely developed many of his techniques through the guidance of Henry B. Wright of Yale University, who wrote manuals explaining personal evangelism practices and techniques. According to Wright, the task of personal evangelism was a persuasive appeal that introduces a person to Christ through the evangelist's example and labors. The techniques employed by personal evangelists focused on personal interactions and trust building. Wright's "expert friendship" model required evangelists to befriend others to provide a living example of Christ's effects in one's life. Practically speaking, Wright believed personal evangelism was best done within specialized groups such that students worked with students, soldiers with soldiers, and so on. Although rarely noted, the practice of expert friendship as expounded by Henry Wright bears significant resemblance to the early practices of helping others and what has since become standardized in AA under the practice of sponsorship where one alcoholic mentors another into the AA program.

In turn, Buchman summarized Wright's tasks and techniques under the label of the "Five C's" of confidence, confession, conviction, conversion, and continuance. Thus, members were to gain the confidence of a new recruit, witness to the recruit to bring to awareness how his anxiety was a sign of sin (conviction), and thereby induce a conversion. Conversion was followed by a sustained attempt to live a life free of sin, governed by God's will and guidance. To this end, the OGM members promoted the four absolutes of honesty, purity, unselfishness, and love as the guides to action that cleansed the heart and mind so that God's guidance could be received. As a group, members would sit silently and await God's guidance in "quiet time." When a member received guidance on a particular problem or question, he or she would share it with the group to assess whether the guidance in question was reliable.

The OGM often claimed greater revival successes than could ever be verified. In part, the OGM leadership believed that publicity was an excellent form of evangelization. Although its critics accused OGM leadership of publicity seeking, the movement was still visible across the United States by 1932. Regardless of its actual impact, it actively began operations

in 1930 at Calvary Church in New York under the American leadership of Reverend Samuel Shoemaker. Between 1930 and 1936, the OGM gathered frequently at Calvary Church. Although they did not seek out drunks, some alcoholics were attracted to their membership. Among these was Rowland Hazard. During his brief association with the OGM, Hazard learned that a friend, Ebby Thatcher, faced commitment for alcoholic insanity. Hazard visited Thatcher with an OGM team, and Thatcher responded by attending the OGM meetings at Calvary Church in New York. Thatcher would later become the connection between the OGM and AA cofounder William Wilson.

AA Founders

The AA literature identifies AA beginnings with the initial encounter and subsequent collaborations of cofounders William G. Wilson and Dr. Robert H. Smith, later known as Bill W. and Dr. Bob, respectively. Both men suffered years of heavy drinking and hospitalizations, and eventually sought help for their drinking problems in the OGM.

Wilson was born to Gilman and Emily Wilson in East Dorset, Vermont, in 1895. His childhood and adolescence were marked by two traumatic events. When Wilson was ten, his parents divorced. Shortly afterward, his mother went to Boston to pursue a career as an osteopath, leaving Wilson and his younger sister in the care of her parents. Later in life, Wilson recalled his deep sense of rejection and abandonment resulting from the absence of his parents. During his adolescence, Wilson's grandparents sent him to Burr and Burton Academy. While at the Academy, Wilson became head of a Young Men's Christian Association (YMCA) chapter, excelled in school, and fell in love with a classmate, Bertha Branford. During chapel one morning, Wilson was devastated to learn that Bertha had died suddenly while traveling in New York with her parents. Later in life, Wilson acknowledged that Bertha's death began a cycle of depression that lasted nearly three years. Despite these early traumas, it was not until shortly after Wilson was commissioned as a second lieutenant in 1917 that he had his first drink while attending a social function supporting servicemen and the American war effort in Europe. Most notably, Wilson experienced a subtle shift in his disposition from a sense of awkwardness to social ease.

Between 1918, when Wilson married Lois Burnham, and 1923, there is little evidence that Wilson's drinking was a problem. In fact, during that period Wilson completed a year-long tour of duty in Europe, finished law school, and became a stock company researcher. Little by little, however, Wilson's drinking escalated to troubling proportions. Despite significant success as a stock investigator on Wall Street, Wilson recorded a written pledge in the family Bible to abstain from drinking for one year in 1923. His pledge lasted only two months. In 1927, he made another pledge with similar results. With the stock market crash in 1929, Wilson's financial future looked bleak. Through an associate, he was able to find good paying work in Canada, but this opportunity ended with a drinking-related conflict. For the next several years, Wilson struggled with his alcoholism and found keeping a job difficult. By 1933, he was admitted to Charles Townes Hospital in the first of several efforts to cure him of his alcoholism.

Wilson was aided in these early efforts at abstinence through his association with the OGM. Wilson's acquaintance with the OGM and its practices began when Ebby Thatcher, an old school friend and known drunkard, visited Wilson in November 1934. Unlike previous visits, Thatcher was clear eyed, sober, and eager to discuss his newfound sobriety with Wilson. Crediting the OGM brand of "religion" and "life-changing" for his newly acquired self-control and abstinence, Thatcher encouraged Wilson to attend the OGM. Although religion did not appeal to Wilson, four alcohol-related visits to the Charles Townes Hospital between 1933 and 1934 left him open to his school friend's suggestions. Wilson attended his first OGM meeting at Calvary Church mission in New York. Drunk on arrival, he was allowed to participate after eating a meal and drinking some coffee. After the meeting, Wilson returned home without stopping at a bar. A few days later, he checked himself into the Townes Hospital one last time. While at the hospital, he had a spiritual experience. Filled with feelings of desperation and hopelessness, he found himself asking God to help him. Then Wilson felt an assuring presence he believed to be God.

Upon leaving Townes Hospital in late December of 1934, Wilson began to associate with the OGM and to focus his efforts on evangelizing to other alcoholics. His brief experience with OGM, his twelve years of excessive drinking, and his trips to the Townes Hospital convinced him of two basic ideas that shaped his message. First, alcoholics are powerless over their desires to drink, and a self-conscious recognition of this powerlessness was essential to an alcoholic's recovery. Second, recognition of one's powerlessness must be accompanied by the recognition that the only remedy for alcoholism is a spiritual experience. Through his association with the OGM, Wilson learned the per-

sonal value of sharing his experience with other alcoholics, and to his own surprise he found that sharing his story with other alcoholics was helping him stay sober. Although he was ineffective in persuading alcoholics to adopt a life design consistent with OGM, Wilson still persisted in efforts to help other alcoholics.

Wilson's cofounder, Dr. Robert Smith, followed a slightly different path to alcoholic desperation. At age nine, Smith had his first drinking experience. Throughout his education, especially his college years at Dartmouth, Smith was regarded as a heavy drinker, but it was not until medical school at the University of Michigan that he began to suffer alcohol-related problems. Unlike his college years where he could drink without consequences, he now began to engage in heavy binge drinking that interfered with his studies. Shortly before his dismissal from the University of Michigan in 1907, Smith transferred to Rush Medical School in Chicago where he was able to finish his degree only after swearing off drinking for two semesters. After completing medical school, Smith moved to Akron, Ohio, and opened a medical practice. There his drinking continued to intensify, regularly landing him in sanitariums. In 1914, Smith's father brought him back to Vermont to sober up. Smith stayed sober and married Anne Ripley in 1914. His sobriety lasted until just before passage of the Volstead Act. After the passage of Prohibition, Smith continued to drink by forging alcohol prescriptions for himself and, later, sedatives as well. During his sixteen years of heavy drinking, he placed himself under medical care on no fewer than one dozen occasions. By 1933, his medical practice was nearly destroyed. Guilt-ridden and ashamed by the impact of his drinking on his family, Smith agreed to attend meetings of the OGM in Akron with his wife, Anne Smith. Beginning in 1933, he began regularly attending OGM meetings but with little impact on his drinking.

Wilson/Smith: First Meeting

In May of 1935, Wilson found himself alone in the Mayflower Hotel in Akron, Ohio, after a failed business venture. While puzzling over his next move, he began calling local ministers in search of another alcoholic with whom he could share his story. Through a clergy contact, Wilson was put in touch with an OGM member who had been working with Dr. Robert Smith.

Wilson and Smith met on Mother's Day in 1935 at the Akron home of an OGM member. In his message to Smith, Wilson emphasized that alcoholism was a disease of mind, body, and spirit. Like his friend Ebby before him, Wilson shared his observations on how drinking had destroyed his life and how his continued abstinence depended on helping others through sharing his story. The conversation was by no means novel to either man. Wilson had been attempting to help other alcoholics for months through his association with the OGM. Smith had spoken with medical experts, clergy, and friends about his drinking, and none of these previous discussions had proven effective. Yet, both men were changed by their meeting. Years later, Wilson reported that his initial encounter with Smith was marked by an altogether different attitude and approach. Unlike previous attempts, Wilson did not preach or try to convert. Moreover, as he spoke with Smith, he began to realize that he needed Smith as much and possibly more than Smith needed him. Similarly, Smith later reported that his exchange with Wilson was reciprocal and mutual. In Wilson, Smith found a man who shared a similar struggle with alcohol and was cured by the same spiritual practices he was pursuing.

Encouraged and moved by Wilson's message, Smith invited Wilson to stay that evening at his home. Wilson remained with the Smith family for the next several weeks while Wilson and the Smiths tried to apply OGM practices to their lives in an attempt to stay sober. Smith remained sober for three weeks, at which time he was called away from home for a few days to attend an annual medical convention. When he returned, he was drunk. Wilson and Anne Smith tended to Smith as he tried to sober up. Only three days later, Wilson drove Smith to the hospital to perform surgery. Before the surgery, Wilson gave Smith a beer to calm Smith's jitters. After the surgery, Smith committed to the project of sobriety and suggested to Wilson that they ought to start something to help other alcoholics. Smith claimed his first date of sobriety as June 10, 1935.

Together, Wilson and Smith began their mission of helping other alcoholics within the context of the OGM. They began their project by seeking out alcoholics at the Akron City Hospital. Within a few weeks, Wilson and Smith had recruited a third member to their fledging group of sober alcoholics. By the end of the summer when Wilson returned to New York, he and Smith had increased their number to six. In these very early efforts, Wilson and Smith searched out other alcoholics in an effort to share their experiences with alcohol and abstinence. Moreover, Wilson and Smith continued to employ OGM practices in working with alcoholics by stressing powerlessness over

alcohol to new recruits and instructing them to follow policies of rigorous honesty, restitution, and unselfishness through unpaid aid to other alcoholics. Although the self-conscious identification of AA would not be complete for another four years, the basic practices were now in place.

Steps Toward Independence and Group Identity

Wilson/Smith Difference with OGM

As their numbers increased, the presence of alcoholics focused primarily on helping other alcoholics began to strain relations between the alcoholic and nonalcoholic members of OGM. The most prominent strain in the New York branch of the OGM centered on an insistence by more senior OGM members that Wilson and his fellow alcoholics should evangelize to any, and all, sinners and not limit their efforts to alcoholics. But within only a few months, Wilson and his small group within the OGM had shifted its focus from saving sinners to saving alcoholics. Moreover, whereas the OGM focused its efforts around its motto, "Nation changing through life changing," the alcoholic members focused solely on life changing without regard to social and political transformation.

This fundamental difference was not the only one. Certain OGM practices, including the four absolutes, guidance, and quiet time, were either too explicitly religious or counterintuitive to working with down-and-out drunks. These practices found little support among the alcoholic members of OGM. In addition, OGM public relations were seriously jeopardized by Frank Buchman's favorable comments about the Nationalist Socialist Party in Germany and the impending condemnation of the OGM by the Roman Catholic Church. By 1937, the differences were too difficult to bear, and Wilson and his drunks left the OGM and began meeting independently. The split in Akron occurred in 1939 but was less contentious.

Clarifying the Alcoholics Anonymous Identity

Several important events transpired during the years between the initial Wilson/Smith encounter and the publication of the AA "Big Book" that contributed to solidifying group identity. In 1936, Charles Townes offered Wilson a paid position as lay therapist and asked him to transport his practice of helping others into the Townes Hospital. Enthusiastically, Wilson brought the proposal to his alcoholic colleagues, who openly worried that involvement with for-profit enterprises might undermine the efforts and successes they were experiencing with helping others. Wilson rejected Townes's offer on recommendation from the members of the new fledgling and unnamed society of alcoholics helping other alcoholics. Later, Wilson's decision would be formalized in Tradition Eight which reads: "Alcoholics Anonymous should remain forever nonprofessional, but our service centers may employ special workers."

Shortly thereafter, through family connections, Wilson was given a meeting with John D. Rockefeller's charitable foundation. Wilson requested $50,000 to continue their work and build a hospital. Rockefeller declined but put a small sum in trust to support Smith and Wilson while they continued their efforts to help alcoholics. Rockefeller reasoned that early AA members were better off working without the aid of these funds. The experience with Rockefeller would later be institutionalized as the seventh tradition, which states: "Every AA group ought to be fully self-supporting, declining outside contributions." In order to oversee the funds donated by the Rockefeller Foundation, the Alcoholic Foundation was established in 1938.

A crucial component of the articulation and evolution of group identity was the production of what would later become *Alcoholics Anonymous: The Story of How Many Thousands of Men and Women Have Recovered from Alcoholism* (1939). In May 1938, Wilson began drafting an outline of practices he and his new colleagues found successful in helping other alcoholics. The book is divided into two parts. The first part is devoted to outlining the practices early members followed in successful abstinence. Wilson began by outlining the six steps he and others were employing in helping others: a recognition of powerlessness, honest self-appraisal, shared honesty with another, amends and restitution to persons harmed by alcoholic drinking, help to other alcoholics without compensation, and reliance upon God. Wilson later expanded these six steps to the Twelve Steps. The second part of the book consists of forty-four similarly structured personal stories, averaging between 1,500 and 2,000 words, that narrate experiences of the founding members. Wilson's draft was carefully edited by other sober alcoholics in New York and Akron. The book was later called "The Big Book" in reference to its large dimensions and thick paper. Later, this moniker would take on additional connotations and has since been referred to by scholars as the AA Bible, which references how the book has come to be the object of special reverence by some of the AA membership.

By 1939, AA membership had reached 100, *Alcoholics Anonymous* was published, and groups were located in several cities. Among the contributions to AA's early growth was the positive press received by the group. Articles in *Liberty Magazine* and the *Cleveland Plain Dealer* generated over 1,000 calls for help. In 1941, an established reporter, Jack Alexander, wrote an article on AA for the *Saturday Evening Post* that resulted in 6,000 new members in a ten-month period. In 1944, members of AA began a "meeting in print" entitled the *AA Grapevine*, which quickly became a national newsletter and source of exchange between AA members throughout the United States. Even with the aid of the newsletter, small groups across the United States looked to AA's central office in New York for guidance and instruction. With its rapid expansion, the AA membership began facing important issues of group governance, organization, and authority. In some cases, disputes emerged over internal policies and relations to the wider public.

During its first decade, the AA members accumulated substantial experience indicating that certain group attitudes and principles were particularly valuable in assuring the survival of the informal structure of the "fellowship." In 1946, the fellowship's international journal, the *AA Grapevine*, published these principles as the Twelve Traditions of Alcoholics Anonymous. They were accepted and endorsed by the membership as a whole at AA's first international convention in Cleveland, Ohio, in 1950.

TWELVE TRADITIONS

1. Our common welfare should come first; personal recovery depends upon AA unity.
2. For our group purpose there is but one ultimate authority—a loving God as He may express Himself in our group conscience. Our leaders are but trusted servants; they do not govern.
3. The only requirement for AA membership is a desire to stop drinking.
4. Each group should be autonomous except in matters affecting other groups or AA as a whole.
5. Each group has but one primary purpose—to carry its message to the alcoholic who still suffers.
6. An AA group ought never endorse, finance or lend the AA name to any related facility or outside enterprise, lest problems of money, property and prestige divert us from our primary purpose.
7. Every AA group ought to be fully self-supporting, declining outside contributions.
8. Alcoholics Anonymous should remain forever nonprofessional, but our service centers may employ special workers.
9. AA, as such, ought never be organized; but we may create service boards or committees directly responsible to those they serve.
10. Alcoholics Anonymous has no opinion on outside issues; hence the AA name ought never be drawn into public controversy.
11. Our public relations policy is based on attraction rather than promotion; we need always maintain personal anonymity at the level of press, radio and films.
12. Anonymity is the spiritual foundation of all our traditions, ever reminding us to place principles before personalities.

AA as a Social Force for Treating Alcoholics

As AA became a recognized source of aid for problem drinkers, local groups were deluged with calls for help. In an effort to field these calls and facilitate communication within groups, local groups formed central offices and intergroup associations designed to keep updated lists of meeting times and locations, distribute AA literature, and provide a clearinghouse for service opportunities. By the twentieth anniversary of AA beginnings, the original Alcoholic Foundation had been renamed the General Service Board and the office in New York renamed it the General Service Office, which began its services as the basic support structure for group activities throughout the United States. Recent studies of AA suggest that its unique structure forms an upside-down pyramid, with the central structure serving as a base to local activities rather than the reverse. Through this process of adaptation, AA built an administrative structure that enabled new groups to develop their own constituencies and form networks at the local levels while providing the local groups with the necessary communication and support.

The AA Program: The Twelve Step Practices

The Twelve Steps are offered as suggestions in both *Alcoholics Anonymous* and a later exposition written by Wilson entitled "Twelve Steps and Twelve Traditions." Unaltered since their initial presentation in print form, the steps represent the collective experience of AA's founding members itemized into the most

basic components of a turn from a life of active alcoholism to a life guided by AA principles and practices. In this respect, the steps refer to shifts in beliefs, actions, and attitudes of alcoholics and their relations to alcohol, self, God, and others.

Many scholars divide the Twelve Steps into three categories: decision, action, and maintenance steps. The decision steps (1–3) are classified as decision because members make significant and life-altering decisions with respect to their own beliefs, attitudes, and actions. These life changes refer specifically to an alcoholic's recognition of powerlessness, belief in a higher power, and a choice to surrender to that higher power.

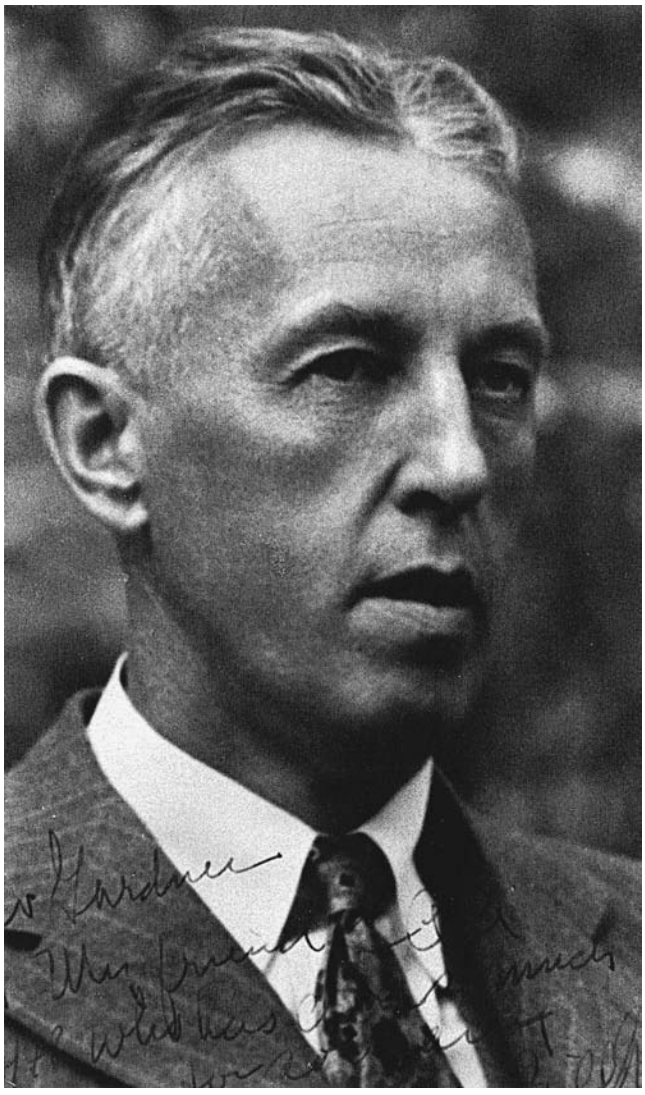
The action steps (4–9) refer almost explicitly to repairing relations with others by changing the beliefs, attitudes, and practices that figure into one's relations with others. Underlying these action steps is the idea that certain beliefs, attitudes, and actions become mechanisms in one's ordinary life. When the mechanisms are organized around self-will and self-reliance, the results are invariably dangerous for alcoholics since poor relations with others hinders sobriety. Thus, the steps are guides to rooting out these deleterious mechanisms. Two such mechanisms, fear and resentment, are cited as the kinds of mechanisms targeted by Steps 4 through 9. For example, fear is described as a pervasive force extending to every area of life. According AA literature, alcoholics have a special tendency to allow fear to motivate their life choices. The mechanisms connected to fear vary but tend to connect fear to excessive self-reliance, which produces dishonesty, manipulation, and other vices. What is crucial, however, is to realize that the inventory and admission steps (4 and 5) identify these mechanisms as they play out in an individual's life as well as the subsequent steps that aid in ridding persons of those mechanisms and replacing them with alternative mechanisms based in reliance upon God.

The maintenance steps (10–12) refer to maintaining sobriety through continued efforts to keep right relations with others (Step 10), God (Step 11) and sobriety through the practice of helping others (Step 12). Step 12 reads: "Having had a spiritual awakening as the result of these steps [steps 1–11], we tried to carry this message to alcoholics and to practice these principles in all our affairs." Carrying the message to alcoholics is practiced communally and individually. Group activities identified as carrying the message include AA meetings, group commitments to set up AA meetings for alcoholics in rehabilitation or detoxification centers, and other forms of outreach. Individually, helping others involves participation in meetings through sharing one's story, service activities for the meeting (e.g., making coffee or setting up chairs for the meeting), outreach to the still suffering alcoholic, and sponsorship (working one-on-one with another alcoholic).

Helping Individual Alcoholics

The seventh chapter of the Big Book, "Working with Others," identifies further techniques and guides for helping others. In short, these techniques emphasize a regard for the still suffering alcoholic. In helping others, members are directed to search out alcoholics who are ready for change in their drinking practices and express their readiness through a desire to stop drinking. AA members are advised to refrain from approaching drinkers who have not solicited their help or advice. This "readiness requirement" even suggests that members might find it necessary to wait for a potential recruit to go on an alcoholic binge before approaching him or her, because it is after a binge that the alcoholic is most remorseful and ready for the AA message. A second requirement for helping the prospective candidate is sharing one's own experience. This sharing must follow the storytelling formula and must therefore emphasize that recovery from alcoholism depends on shifting from a life based on self-will to a life based in God's will or the will of a higher power. The only restriction on this technique is that members are advised against imposing a conception of God or spirituality on a recruit. A related requirement is to never let the alcoholic believe that his or her recovery depends on something other than God's will because it is just such a belief that promotes self-will. Thus, those who would make recovery contingent upon the restoration of family or career are informed that this basis is insufficient. The aim of this emphasis is to ensure that the prospective member possesses the appropriate reasons for embarking on the new pattern of life.

The rule of helping others is balanced with special relations besides membership, such as self, family, and employers. A member may go to great lengths to help a prospective candidate, provided that the prospective member is not using the member's generosity as a "blank check" for motives other than reassembling a life according to spiritual principles. Whether providing money, shelter, or other assistance that is required, helping others should never deprive the family, creditors, or employer of their due. This balance is justified by the experience of complimenting self and others. Helping others should not empty one of the



After years of excessive drinking, William G. Wilson cofounded Alcoholics Anonymous in the 1930s. The group's "Twelve Step" program, which Wilson largely created, has helped millions of people worldwide to overcome their addiction to alcohol. *(AP Wide World Photos)*

capacity to meet special commitments necessary to human flourishing.

A 12th Step Call is an occasion where a member shares his or her story with the "still suffering alcoholic." This may involve meeting the prospective member at his or her home, a detoxification center, hospital, or AA meeting. Members make Twelve Step calls only when requested by an alcoholic. Thus, the 12th Step Call is a venue where the existing member and prospective share a similar struggle with self-will. In this sense, the 12th Step Calls, however anonymous, involve a relationship based in mutuality. The paradigmatic story against which all other stories are measured is the encounter between cofounders Bill Wilson and Dr. Bob Smith.

Meetings

Meetings serve as the primary medium for AA practice and are crucial to AA's success as a social movement. Meeting locations vary significantly from church basements to community halls, but meeting participants occupy space in predictable patterns. Typically, important features of AA practices such as the Twelve Steps and Twelve Traditions are posted in prominent places. Similarly, pictures of AA cofounders Wilson and Smith, important slogans, and the Serenity Prayer are posted. Finally, a literature table with AA literature as well as a list of meetings in the local area is usually found at the entrance. Meeting participants will vary their seating arrangement according to meeting sizes, with larger meetings in audience style and smaller meetings arranged in a circle of chairs. Practically speaking, meetings are the social sites where members acquire the skills, relationships, and motivation to sustain abstinence. When new members express concern over success in their new endeavor, older members will reassure new members by saying, "Read the Big Book, Go to Meetings and Listen to Your Sponsor."

Ordinarily, AA meetings are divided into closed and open meetings. Closed meetings are restricted to members only, while open meetings allow family and friends of alcoholics as well as interested outsiders. Although open meetings typically present a speaker with a minimum amount of sobriety to share his or her story, closed meetings follow a variety of formats designed to focus on particular elements of the program.

Meeting formats do vary, but a typical meeting is opened by a group member who welcomes regular attendees, guests, and newcomers. Participants are then prompted to introduce themselves by saying, "My name is _____, and I am an alcoholic." Not all participants are required to add "alcoholic" to their introductions as visitors may indicate their indecisiveness. After introductions, a member will review announcements for the group and then read, or request a volunteer to read, from foundational texts within the group. Often a member reads aloud Chapter 5 from *Alcoholics Anonymous*, entitled "How It Works," which contains a description of the alcoholic dilemma and the Twelve Steps. Some meetings select additional readings, but these choices are left to group discretion per traditions of meeting autonomy. Con-

current with the readings, members will pass a hat to honor the fifth tradition, which states that each AA group is fully self-supporting. The money collected is used to pay for meeting expenses and AA literature, and a small amount is sent to the General Service Office in New York. Afterward, members will often set aside time to recognize sobriety anniversaries ranging from twenty-four hours to many years. Depending on meeting type, the remainder of the typical meeting varies. For instance, speaker meetings will devote the remaining time to a speaker or speakers who share their stories, which follow the standard pattern established in the Big Book. Speakers share "what it [their drinking experience] was like, what happened [the intervening experiences that led to AA membership], and what it is like now [life since the beginning of sobriety]." In discussion meetings, a more experienced member will raise a topic for discussion through a five- to ten-minute talk, and then each member is given time to discuss the topic as it relates to his or her experience. In larger groups, there is a short break to reconfigure into smaller discussion groups, where each member is given an opportunity to share. Meetings may also have a special agenda. For example, in step meetings speakers discuss one of the twelve steps rather than a topic, and in Big Book meetings a sustained study of the Big Book is usually involved. Almost all meetings close with a prayer ritual that in many groups still reflects the influence of the OGM. Members will sometimes join hands to close the meeting with a prayer, which could be the serenity prayer or what is known as the Lord's Prayer in the Christian tradition.

Alternative Alcohol Recovery Movements

The diffusion of AA and the Twelve Steps as the predominant treatment modality has spawned several alternative alcohol recovery movements such as Synanon, Women for Sobriety (WFS), Secular Organizations for Sobriety (SOS), and Rational Recovery (RR), to name only a few. In each of these cases, these movements were self-conscious departures from AA practices emerging from ideological differences with AA. For example, Jean Kirkpatrick, Ph.D., founded WFS in 1976 to aid women in recovery from alcoholism. Drawing on her experiences with AA recovery practices, Kirkpatrick concluded that the masculine bias in AA could never successfully aid women in their recovery efforts because AA practices failed to account for significant gender differences contributing to alcoholic behaviors and recovery. From sexist discourse at meetings to a male-oriented approach to recovery that begins with powerlessness, Kirkpatrick concluded that women alcoholics were ordinarily saddled with subordinate roles that led them to experience a feeling of dependence. Instead of focusing on powerlessness, Kirkpatrick suggested that women alcoholics need to focus on recognizing alcoholism as a physical disease and to assume responsibility for their bodies and the illness from which they suffer. In keeping with these differences, WFS employs alternative recovery techniques such as the thirteen affirmations that emphasize the power of positive thinking rather than AA's Twelve Steps. Members introduce themselves by saying: "My name is _____ and I'm a competent woman" rather than "My name is _____ and I am an alcoholic." Organizationally, groups are limited to ten members who meet weekly for ninety minutes under the direction of a Certified Moderator.

Both SOS and RR describe their organization as an alternative model of recovery based on a secular approach and view addiction recovery as independent of religious or spiritual endeavors and projects. For instance, SOS views alcoholism as a disease requiring total abstinence, but total abstinence does not require spiritual experiences or religious ideology. Instead, the SOS program of recovery stresses substituting cycles of addiction with cycles of sobriety. According to this view, addiction begins with a physiological need habitually satisfied until addiction satisfaction becomes a fundamental priority. The addict simultaneously suffers from denial of this very problem. In response to the cycle of addiction, SOS recommends a cognitive therapy based on individual acknowledgment of one's addiction, acceptance of one's disease, and emphasis on sobriety as one's number one priority. The cycle of sobriety remains unless the addict chooses to abandon it.

Understanding AA's Impact as a Social Movement

Most scholars agree that researchers are years away from calculating AA's impact on treating alcoholics, but two sites of activity express and signify AA's impact as a social movement: alcohol treatment practices and attempts by U.S. courts to evaluate the constitutionality of Twelve Step practices in criminal rehabilitative efforts.

Almost since its inception, AA practices have been adapted to professional treatment settings in varying degrees. William White's authoritative history of alcohol treatment in the United States chronicles AA's influence in shaping models of alcohol

treatment. Beginning with Dr. Bob's efforts at St. Thomas's Hospital in Akron, the practice of hospitals employing a Twelve Step philosophy and relying on unpaid members of AA to help treat alcoholics is the dominant treatment model. The St. Thomas model emphasized sponsorship of patients by members of AA, employed the Twelve Steps in treating alcoholics, and stressed mutual-help strategies, with clients helping clients. Similar strategies and arrangements emerged simultaneously within prison and correctional facilities to treat alcoholics.

In recent years, rehabilitation programs that draw on the Twelve Steps, or require AA attendance, have been challenged in U.S. courts on the basis that mandated and compulsory attendance at AA meetings violates the establishment clause. In almost all cases heard before the courts, the questions have emerged from the presence of Twelve Step practices in the criminal rehabilitation process. In the earliest cases before the courts, the role of Twelve Step practices as a part of sentence fulfillment was ruled as constitutional. According to these early cases, the courts found that correctional authorities who employed Twelve Step practices and mandated AA meetings were in fact neutral on questions of religion and that whatever religious encouragement an inmate might endure at a Twelve Step meeting was secondary to the state's interest in treating an inmate's substance abuse problems. In short, the earliest cases followed a fairly strict application of the traditional "Lemon Test" the courts employed to verify establishment clause violations (*O'Connor v. California* [1993], *Stafford v. Harrison* [1991], and *Jones v. Smid* [1993]).

The courts have not been uniform in viewing the religious features and effects of AA and Twelve Step practices as secondary. For instance, in 1996, the New York Court of Appeals decided in favor of David Griffin, an inmate at New York State Shawangunk Correctional Facility, who petitioned the court to excuse him from taking part in the Alcohol and Substance Abuse Treatment Program (ASAT). ASAT provided treatment services for corrections inmates suffering from alcoholism and chemical dependency. Griffin sought relief from participating in ASAT because the program involved attendance at AA meetings, which based some of its therapeutic techniques on religious principles. Griffin's attorney argued that compelling attendance at AA meetings violated inmate rights to religious freedom.

The court ruled that the nature of the ASAT program and Griffin's participation in it violated the establishment clause and was unconstitutional. Griffin's involvement in ASAT and the resulting expectation of attendance at AA meetings were predicated on his participation in the Shawangunk Family Reunion Program, which placed three conditions on participating inmates. First, inmates must have served a minimum length of their sentence, and, second, inmates must be free of disciplinary probation for prison rule violations. The last condition, and the most contentious one, required inmates with histories of substance abuse to participate in ASAT as a condition of participation in the Family Reunion Program. Because Griffin met each of these conditions (including sustained heroine abuse from 1955 to 1968), his participation in Family Reunion required his attendance at ASAT and AA meetings. In the court's view, the connection between AA and sentence requirements created the primary effect of advancing religion.

Finally, what the sites of treatment practices and the court rulings direct our attention to is the range and impact AA has had on practices of helping alcoholics, the difficulties of measuring AA's impact, and the contested territories in which AA operates. In focusing on the practice of helping others, the present article has traced but one genealogy in a complex web of untold stories. To fully appreciate the movement, further analysis focused on AA practices as they relate to race, gender, disability, and class is needed.

Religious, Utopian, and Health Movements

Introduction

The explosive combination of America's radical religious and cultural diversity within a hegemonic, entrenched Protestantism has served as the catalyst for some of the most powerful social movements in U.S. history. Pre-contact Native Americans practiced many different beliefs whose multiplicity was only enhanced by the post-Columbian immigration of Europeans and Africans with their own myriad systems of belief and practice. The U.S. Constitution's prohibition against establishing a single national religion further set the foundation for a plurality of religions to flourish. Without the state to regulate orthodoxy, Americans were free to believe as they chose and to start new movements when they became dissatisfied with existing religions. Substantial immigration added to America's religious diversity. Men and women from all over the globe brought their cultures to the North American soil. Yet immigrant and Native religions never remained static, but in different regions around the country evolved in particular and distinct ways, lending local flair to adherents' spiritual lives. At the same time, Protestant Christianity has left an indelible imprint on the major institutions, creeds, and belief systems that shape civic life. But like every other American religion, Protestantism has changed over time, influencing other religions as they influence it. American religions are in a constant state of evolution resulting from centuries of contact between competing groups of religious people. This contact and combination between the dominant culture and the nation's many subcultures has been the definitive characteristic of American religion and has inspired complex social movements.

Colonists raced to the Americas in the seventeenth and eighteenth centuries for a variety of reasons, including reaping profit, proselytizing, and building a new way of life. On the East Coast, pluralism flourished as New England Puritans sought to define the trajectory of North American life, while Quakers, Natives, and a host of other religious groups served as constant reminders that the American story was much more than one of Protestant triumphalism. On the West Coast, Father Junipero Serra and his allies struggled to bring Roman Catholicism to the indigenous people of California. Within a couple of centuries, revivals broke out on the Eastern Seaboard, which helped set the stage for the American Revolution.

After the war, multiple major religious movements emerged. One of these movements, "civil religion," was initiated primarily by elites who sought to give religious meaning to their new nation. Other movements emerged from a series of Protestant-initiated revivals that fit the character of the times. They were more democratic and egalitarian than the revivals of the prewar era, and they spawned unique social movements affecting Anglos, African Americans, and Native Americans, among others, in different ways. Visionaries, unencumbered by the restrictions of previous generations, built utopian communities, while prophets looking heavenward foretold the end of the world.

After the Civil War, the United States' immigration patterns shifted. More and more people began arriving from Central, Eastern, and Southern Europe in contrast to the previous generations which had more often originated from Western Europe. And on the West Coast, Asians arrived in great numbers, answering American business's call for inexpensive labor. With the evolving immigration came new religious trends. The country's Jewish and Catholic populations, which were already sizable, surged. At the same time, new religions from other parts of the globe appeared for the World's Parliament of Religions, a conference of leaders from major world religious groups held in Chicago in 1893. Out of this increasingly pluralistic context and fueled by continuing heavy immigration, many new social move-

ments emerged, which only multiplied after World War II. In the 1960s, Congress passed legislation that reformed America's immigration laws. Nonwhite, non-Protestant religions flourished as quotas favoring the immigration of Europeans and restricting the immigration of Asians and other national groups came to an end. The result has been a revolution in religious diversity in which America's pluralism has emerged from back alleys and moved to Main Street. Islam, Hinduism, and Buddhism are among the groups that illustrate this change, while other Americans have reached out to the New Age movement.

Religiously based social movements have defined America. Thousands of pioneers have emerged, some manipulating historic faiths and others building entirely new movements. Some have enjoyed tremendous success, while others have faded into oblivion. Heavy immigration, charismatic individuals, strong organizations, and protection against the establishment of a single religion have allowed thousands of religious movements to thrive in North America.

Utopian and Health Movements

This section also includes entries documenting the unique phenomenon of utopian communities that have been integral to American society from the origins of European colonization. From the earliest days of settlement to the contemporary era, utopian and communal communities remained pivotal to understanding the distinctive American culture and society built on the yearning to build a better society. From the earliest days of settlement in North America, utopian sentiment proliferated, as people with idiosyncratic ideologies and religious feeling, estranged in their homelands abroad or alienated within the broader American society, sought out a more meaningful life. Throughout the nation's history, utopian communities have held a broad range of beliefs and ideologies, ranging from fundamentalist religion to ideological principles on building egalitarian communities.

Although many held distinctive and contradictory ideas and practices, they all shared dissatisfaction with mainstream society, whether they were European Christians migrating to the nation to establish religious communities that more specifically adhered to their sometimes fundamentalist beliefs and ascetic lifestyles or utopian socialists seeking to establish collectivist communities. Utopian communities established settlements that put their sometimes abstract philosophical beliefs into active practice. Another feature of utopian communities was their lack of continuity. Again and again, utopian societies have been established, expanded, and then usually declined as the most extreme advocates lost their passion or could not convince their descendants to stay on and carry out their missions. Still, some older utopian communities remain to this day, though on a smaller scale, and new models that attract new generations of adherents gain power. Throughout U.S. history, communities establishing communal forms of organization have predominated, starting with the early colonists who escaped established European religions and extending much later to the Buddhist retreats and Hindu ashrams that have gained sway in the contemporary era.

Religious fervor or alienation from the dominant community has always been a central feature of utopian communities. Perhaps the most well-known such communities were the Shakers—formally, members of the United Society of Believers in Christ's Second Appearing—who migrated from England in the late eighteenth century and established a community based on ascetic ideals of repentance and denial of what they considered to be gluttonous and worldly lifestyles based on the pleasures of life. A distinctive feature of the Shakers was their demand that all members remain celibate. Ironically, the Shakers became known for their handiwork and their production of craftworks that were demanded outside their communities. Later the Shakers became known for their innovations—including the circular saw, the clothespin, and flat broom—and were keen on new technological advances, including the automobile. Still, at the core of the Shakers' religious belief was their strong belief in monastic, simple lives unencumbered by possessions and human desire. At their height in the early nineteenth century, the Shakers had several thousand members in twenty community villages. But the membership began to decline at the end of the nineteenth century as communal villages closed. Today only one Shaker community remains—Sabbathday Lake, Maine, and the sect's future is tenuous and uncertain.

As new immigrants arrived on American shores, fervent religious believers among them established new utopian communities. In the nineteenth century, religious German communities were established in the Northeast and Midwest, including the Harmonists and the Rappites, Inspirationists, Amana, Noyes, and

the Oneidans. But religion was not the only basis for the formation of communal societies. Some communities were established on the basis of cooperatives and the sharing of all resources. Perhaps the best known was Harmony Society established in New Harmony, Indiana, in early 1825. Utopian communities frequently failed to establish enduring communities, primarily because they were open to all and because of difficulty in encouraging all to participate on an equal basis, as was the case in New Harmony, two years after its formation. Although utopian communities frequently did not flourish, as was the case in New Harmony, they attracted academics, scholars, and scientists, and became models for progressive educational reform.

Brook Farm, a community formed in 1841 in West Roxbury, Massachusetts, by New England transcendentalists, including Ralph Waldo Emerson, pursued free mental exploration and direct experience of the material world in rural areas in the early nineteenth century. The community engaged in manual labor and thoughtful interchange, education, and socializing, which helped them gain adherents throughout the country. Subsequent communities based on the Brook Farm model, most notably Charles Fourier's phalanx community, were specifically designed according to plans intended for communal participation. Still, most were short lived. Subsequent secular communities were established throughout the late nineteenth century as European settlement moved West. Traditions ranged far and wide, from communal sectarianism, economic reform to socialism and anarchism.

The formation of communal settlements by immigrants and by those alienated by the big cities expanded throughout the nineteenth century as Americans searched for spiritual nourishment and uplift. Perhaps the most well known were the Mormons—a sect that, although essentially jettisoning the communal experiment, expanded into major religious social forces to this day. Members were attracted to the religious fervor and to the social and economic supports such communities provided. During the war years, from 1914 to 1945, German pacifists facing discrimination formed the Hutterite community, which grew to over 40,000 members in 400 colonies, declining to about 2,000 members by the early 2000s.

New Age religions, whose roots are largely in Eastern philosophy, became popular in the early twentieth century but exploded after the 1960s. Each community, even those based on common religious philosophy, maintained distinctive ideas. Communal Hindu ashrams and Buddhist monastic communes of all types proliferated throughout the country from the 1960s to this day, each with a distinctive sectarian twist. In the 1960s and 1970s, communes were established in the wake of the social movements of the era, including Anarchists, groups espousing music and the arts, and those promoting psychedelic drugs.

Religious fervor has been an enduring theme in American culture, and sectarian utopian societies continue to form on the basis of fervent belief even in the age of enlightenment, the development of scientific discoveries disproving religions, and rational thought. Indeed, after the 1970s, religious fervor spurred the formation of religious communities embracing radical millennial philosophies of Armageddon, the second coming of Christ, and the coming of the Messiah. Frequently, the leaders of communities were self-styled messiahs, charismatic figures such as James Jones and David Koresh, who were able to sway typically down-and-out and weak people to embrace them as the saviors. Engaging in some of the very same practices as communal societies of generations past—hard work and denial of human urges (except for leaders)—the communities nonetheless became emblematic of the search for meaning and the singular importance of their cause. These sects went so far as to engage in ritual mass suicide, as for instance, the Hale-Bopp Cult that believed they would be chosen for space travel by aliens. Each group had a distinctive character—vegetarianism, gun ownership, drug use, rock and roll, sex, science fiction, and popular culture.

Communes and utopian communities in the United States have both reflected the alienation felt by many in American society and revealed the continual desire of the alienated to create meaning in their lives beyond the culture of consumerism through sharing and visualizing a better future for themselves.

This section also examines the health food movement, comprised of a diverse, disparate effort among many Americans to make food an integral part of their daily living. The health food movement extends well beyond consumer choice and represents an integral part of a long tradition of adherents with a strong belief system. One's choice in food was an ethical consideration on which the fate of the larger community, the nation, and the world depended. Like the utopian communities, the health food movement had

no central core belief, but was comprised of many followers with a diversity of beliefs and ideologies about how food connected to their lives. The movement was led by religious groups, scientists, and ethical organizations committed to the ethical treatment of animals, the environment, politics, and nutrition. For the movement to operate practically, it was connected to food producers, marketers, and distributors that profited from those committed to the movement. The health food movement has remained firmly grounded in American tradition from the nineteenth century to the current era.

Religious Movements: Overview

From pre-Columbian indigenous rituals to modern mass market, technologically savvy faiths, religion has served as a catalyst for social engagement. Steady immigration, revitalization movements, charismatic leaders, and strong institutions have transformed the ideas of a few pioneers into powerful religious movements, reshaping American culture.

Religion in America is distinguished by the combination of a radical religious and cultural diversity with a hegemonic, entrenched Protestantism. Native American groups practiced many different beliefs whose multiplicity was only enhanced by the post-Columbian immigration of Europeans and Africans with their own myriad systems of belief and practice. The U.S. Constitution's prohibition against establishing a single national religion further set the foundation for a plurality of religions to flourish. Without the state to regulate orthodoxy, Americans were free to believe as they chose and to start new movements when they became dissatisfied with existing religions. Substantial immigration has also bolstered America's religious diversity. Men and women from all over the globe have brought their cultures to the North American soil. Yet immigrant and native religions never remained static, but in different regions around the country they evolved in particular and distinct ways, lending local flair to adherents' spiritual lives. At the same time, Protestant Christianity has defined the major institutions, creeds, and belief systems that a broad selection of the American public accepts. This influence is evident in the nation's holidays, songs, political activities, and popular culture. But like every other American religion, Protestantism has evolved over time, influencing other religions as they have influenced it. Historian Catherine L. Albanese argues that American religious life is best described by religious combination. Rather than treating religious systems as relics that resist change and transformation, American religions are in a constant state of evolution resulting from centuries of contact between competing groups of religious people. This contact and combination between the dominant culture and the nation's many subcultures has been the definitive characteristic of American religion and has inspired complex social movements.

Colonial Religion

Colonists raced to the Americas in the seventeenth and eighteenth centuries for a variety of reasons, including profit-making, proselytizing, and building a new way of life. On the East Coast, pluralism flourished as New England Puritans sought to define the trajectory of North American life, while Quakers, Native Americans, and a host of other religious groups served as constant reminders that the American story was much more than one of Protestant triumphalism. Meanwhile, on the West Coast, Father Junipero Serra and his allies struggled to bring Roman Catholicism to the indigenous people of California. As each of these groups labored across generations to advance their religions, a revival broke out on the Eastern seaboard. Known as the Great Awakening, these meetings revitalized colonial Protestantism in the 1730s and 1740s.

England's efforts to expand its empire in the 1600s led to the creation of American Puritanism, one of the continent's most distinctive and formative social movements. Frustrated with the state of the Church of England in the sixteenth century, British Puritans abandoned their homes in search of a place where they could isolate themselves from England's supposed moral degradation and where they might raise their children in the faith. The Puritans believed that in coming to America, they were establishing an unbreakable covenant with God, which was chronicled by Plymouth, Massachusetts, governor William Bradford. Another group of Puritans, who settled a decade later on Massachusetts Bay, had a slightly different

goal in mind. They had embarked on an "errand into the wilderness" to build a holy city, which they hoped would provide a model for governing back in England.

As their leader John Winthrop articulated their goal, they sought to establish a godly, utopian society in the New World that would demonstrate the legitimacy of the Puritan faith to the English. The Puritans ultimately expected to be welcomed back to their homeland where they could lead a religious and political reformation, but this wish never materialized. Puritanism's success derived from its integration of religious ideology with all other aspects of life and society. Government, church, and community were seamlessly entwined, establishing a powerful foundation for the movement to flourish. Puritans were committed to education and built strong schools in North America. They also left little room for dissent. Mavericks who challenged colonial authorities were quickly and severely punished. The two original groups of Puritans eventually merged and together, with new immigrants from England, articulated one of the major religious themes in U.S. history, that of Protestant triumphalism. The Puritans believed that they were God's chosen people for his chosen land, an idea that has resonated with generations of American Protestants.

Although the Puritans have received the most scholarly attention, they were not the only European colonists building religious movements in early America. The Society of Friends, or Quakers, were influential religious pioneers who constantly and intentionally antagonized the Puritans. They built successful communities in New England and in the middle colonies as well. The largest Quaker settlement was in Pennsylvania, a colony established by William Penn as a refuge for his co-religionists. Quakers tended to be more egalitarian than other Protestants and were tied together by their strong communal emphasis. They dressed simply, they rejected social distinctions, and they attempted to live humbly. Theologically, they emphasized all people's ability to find the light of Christ within them, which they believed was a means by which God communicated. This radical idea empowered individuals and shattered religious hierarchies—God could speak through anyone, regardless of age, race, or gender. Unlike most of the Puritans who insisted on keeping their colony religiously "pure," Penn promoted toleration of other groups, including different Protestant sects, Catholics, and Native Americans. Quakers dominated Philadelphia's politics, and as slavery increased in North America they became leading abolitionists. In the nineteenth century, Quakers helped direct the fight for women's equality.

Religious movements were developing on the West Coast as well. In the mid-1700s, Franciscan Father Junipero Serra established an impressive line of mission stations along the California coast from San Diego to San Francisco where Native converts lived with Spanish missionaries. Indians were required to adopt European cultural norms, but in subtle ways they helped the Catholic fathers apply their faith in a context quite different from their homeland. The missions offered Indians tools, trade goods, and food and became a means of social advancement for some. The religious life of the missions became a hybrid of European and native North American customs that were actively negotiated by the two people groups. Well after the missions secularized, local Natives continued practicing an integrated religion that drew from both Catholicism and the traditions of their tribes, which permanently influenced religion in the Southwest.

Over the course of American history, revivals of faith were common. They often arose when religious men and women, dissatisfied with the state of their religious lives and institutions, looked back to previous generations for inspiration. In their predecessors, they discovered what they believed was a higher level of commitment and authenticity than that characterizing their own generation. As a result, they would demand a return to the old-time faith of their forebearers, which led to a renewal of religious vigor and a revitalization of faith. This occurred in the mid-eighteenth century and has occurred repeatedly among people of different ethnicities and faiths ever since.

In the mid-1700s, the colonies experienced a tremendous revival called the "Great Awakening," which eventually influenced the entire Eastern seaboard. Led by charismatic men and women, the revival stemmed from the growing discouragement of a handful of preachers over what they thought was rampant impiety. The faith of their Puritan forebearers had been diluted over time. They believed that even other clergy lacked the proper spiritual credentials to be leading parishioners. Therefore, a group of men and a few women, starting in the middle colonies and New England and progressing to the Southern colonies, began traveling from town-to-town calling for revival. They were controversial, and their ideas eventually caused many churches to split between loyalty to traditional leaders and allegiance to the revivalists. Among the many factors contributing to the Awak-

JUNÍPERO SERRA (1713–1784)

Junípero Serra was born Miguel José Serra in Majorca, Spain, on November 24, 1713. On September 14, 1730, he entered the Franciscan Order and took Junípero as his name. For his proficiency in studies, he was appointed lector of philosophy before his ordination to the priesthood. Later he received the degree of doctor of theology from the Lullian University at Palma, where he also taught philosophy for fifteen years. He occupied the Duns Scotus chair of philosophy until he traveled to Mexico in 1749.

In 1749, Serra was sent to Mexico with Francisco Palou, his lifelong friend and biographer, and proceeded to Mexico City, where he taught briefly at the College of San Fernando. For three years he worked successfully among the Native Americans of the Sierra Gorda and then returned to Mexico City for seven more years, working half of each year in the surrounding villages. A strenuous defender of Indians, he learned the language of the Pame Indians, and translated the catechism into their language. He became famous as a most fervent and effective preacher of missions. His zeal frequently led him to employ extraordinary means in order to move the people to penance. He would pound his breast with a stone while in the pulpit, scourge himself, or apply a lighted torch to his bare chest.

In 1769, Serra went with the second expedition to California, which was commanded by Gaspar de Portolá. When the party reached San Diego, Serra remained to found the mission there, while most of the rest of the party went on in search of the harbor of Monterey. It was the first of the twenty-one California missions (he established nine himself) which converted all the natives on the coast as far as Sonoma in the north and marked the beginning of the European settlement of California. When they returned unsuccessful from the expedition, Serra urged the sending of another, which he accompanied. After they reached Monterey and founded the mission San Carlos de Monterey (1770), Serra remained there as president of Alta California missions; in 1771, because the soldiers were not friendly to the Indians, he moved the mission to Carmel-by-the-Sea and renamed it San Carlos Barromeo de Carmelo, which became his headquarters for the rest of his life. He died at Monterey, California, on August 28, 1784.

Serra is considered by many to be the founder and the pioneer of California. The esteem in which his memory is held by all classes in California is reflected in the fact that a non-Catholic had a granite monument erected to him at Monterey. A bronze statue of heroic size represents him as the apostolic preacher in Golden Gate Park, San Francisco. In 1884, the California legislature passed a concurrent resolution making August 29 of that year, the centennial of Father Serra's burial, a legal holiday.

James G. Lewis

ening's success were charismatic leaders, a well-developed intellectual foundation, and changes in technology and communications.

The Great Awakening's most important and successful revivalist was Englishman George Whitefield, who tied together the many strands of revival into a somewhat distinct social movement. Known as the "great itinerant," he was not confined to one particular church and pulpit, but proclaimed his message wherever he could find listeners. He first came to America in 1739 (at age twenty-five) and eventually made seven trips to the United States, touring all over the colonies. He regularly spoke outdoors to accommodate large crowds, and he preached without notes, in stark contrast to the traditional written sermons of the Puritans. Whitefield's style reduced the physical and social distance between preacher and listener, making him seem accessible to common people. He became America's first intercolonial hero, a celebrity superstar, which was an image he cultivated. His appeal lay in his powerful voice, his theatrical panache, his unique looks—he had a wandering eye—and his masterful rhetorical skill.

The primary philosopher and theologian of the Great Awakening, and one of America's most brilliant minds, was Jonathan Edwards, the pastor of a Congregational Church in Northampton, Massachusetts. In the mid-1730s, Edwards began to preach on the importance of justification by faith, which caused a revival in his church. Congregants experiencing conversion expressed themselves in a variety of ways ranging from weeping to convulsing, to falling prostrate onto the ground, to producing strange verbal sounds. Seeking to build the movement, Edwards began working with other preachers in the region, triggering a widespread revival across the Connecticut Valley. He combined Puritan theology with Enlightenment philosophy, reading heavily in John Locke and Isaac Newton. His intention was not to teach static doctrine, but to bring about a change of con-

sciousness in listeners. He did this by appealing to their "affections," or emotions, with vivid sensational images. He also served as the Great Awakening's foremost promoter, publicist, defender, and interpreter.

Another element of the Great Awakening's success was its inclusive nature. The revival affected more than just Anglo Americans. David Brainerd, Edwards' son-in-law, became a "missionary to the Indians," taking Edwards' ideas to Native Americans. He led a revival among a band of Delaware Indians, baptized thirty-eight of them, and formed a church. When Brainerd died prematurely, Edwards fashioned the revivalist's diary into a heroic book that popularized Brainerd's work, which was read all over the colonies. On Whitefield's tours to the South, many African Americans converted, marking the beginning of Christianity's integration into slave culture. Women were also key players in the movement. A few, the most famous of whom was Bathsheba Kingsley, actually went from church to church preaching and exhorting audiences and even ministers to experience conversion. Although male leaders were never entirely comfortable with women preaching, some like Edwards acknowledged the women's contributions. The revivals ultimately challenged traditional gender roles, providing opportunities for women to speak in public and to teach the scriptures.

The Great Awakening emerged at a time when important new innovations in communication were developing, which was most obvious in the distribution of newspapers. Colonists in both North and South could read about the tremendous crowds and the amazing spectacles of Whitefield's meetings. These reports helped build momentum behind the revivalists and aroused the interest of common people and elites, from poor farmers to Benjamin Franklin. In addition to its formative influence on American Protestantism, the Awakening also had a decisive effect on the colonists' move toward revolution in that it provided one of the first unifying experiences of the eighteenth century. As a result of the widespread popularity of people like Whitefield, colonists began thinking of themselves as distinctly American rather than English or "Virginian." More important, revivalists infused in their audiences a belief that the common person could trust his or her own instincts. No longer did established authorities have to be deferred to, but the religious impulses of regular people were valued. A new national identity, a communications revolution, and the fracturing of traditional authorities spawned by the Awakening helped the colonies unite against England during the Revolution.

The Revolution and Early Republic

In the wake of the American Revolution, two major religious movements developed. The first was civil religion, a movement initiated primarily by elites who sought to give religious meaning to their new nation. The second was a series of revivals called the Second Great Awakening. These revivals fit the character of the times. They were more democratic and egalitarian than the revivals of the previous centuries, and they spawned a number of unique social movements affecting whites, African Americans, and Native Americans in different ways.

One of the most important and distinctively American belief systems is "civil religion," which emerged around the time of the American Revolution. First and foremost, civil religion stemmed from the patriots' efforts to give religious significance to their new nation. The religion of most of the Revolutionary leaders was not the evangelical faith of Jonathan Edwards or George Whitefield but a synthesis of Puritan ideas and humanist philosophy. Like their Puritan predecessors, the patriots believed that America occupied a unique position in God's unfolding plan for history. The result was a combination of religious and political language that put the Revolution on a par with biblical epics. Their belief in a dualistic world with good battling evil, an unrelenting sense of the providence of God, and melodramatic interpretations of international events also had Puritan roots.

These ideas were tempered by the patriots' confidence in humans' ability to make the world a better place and assumptions about God's transcendence from His creation, which derived from European philosophy. Revolutionary leaders, under the spell of the Enlightenment, replaced the active deity of Whitefield with the God of reason, natural law, and natural rights. The Bible inspired much of the rhetoric of the war, but it was a deistic God who had set the universe in motion with specific laws whom they honored. George Washington, after his death, became the ultimate symbol of civil religion. He acquired an almost divine status, recognized as the messiah of the new nation. In America's national songs, on the walls of its shrines, on its money, and in its holiday celebrations, religion and patriotism merged.

While civil religion influenced the national life of the United States, the early Republic proved to be fertile ground for the birth of new social movements. Protestants, who remained the dominant religious group, reshaped their faith in ways that ultimately accommodated the growth of new sects. A few sweep-

ing trends made this possible. First, conversion was simplified. Rather than having to make public and arduous demonstration of their faith, people were able to make an immediate and inward decision to convert. This individualistic accentuation of Christianity appealed to the illiterate and poorly educated, including slaves, rural settlers, and newer immigrants. Second, the role of the preacher evolved. One's authority was justified on the basis of his or her individual conversion experience and his or her ability to attract followers; many Protestants rejected the traditional requirement of a "proper" education for their leaders. Third, religious outsiders faced few restrictions. They encountered a world turned upside down by the Revolution where anything was possible. Traditional authorities had been subverted, leaving insurgents free to shape their faith as they chose.

Out of this context burst the Second Great Awakening. In the last decade of the eighteenth century and in the first of the nineteenth, the colonies experienced a tremendous revival of Christianity, both in the East and among settlers expanding into the Western United States. Among the most famous and important of these revivals were the Cane Ridge camp meetings of 1801. Seeking to influence the spiritual lives of the thousands of people heading westward, local clergy around rural Bourbon County, Kentucky, sent off invitations for a nationwide revival. Between 10,000 and 25,000 people responded, arriving in wagons for this unprecedented opportunity to socialize, to catch up on news and gossip, and to gain valuable information about the West. The result was a sudden and temporary urban setting springing up for a week in the wilderness. Religious meetings were organized around crude, mostly outdoor, preaching platforms, which were shared by a potpourri of speakers, including black and white Methodists, Baptists, and Presbyterians. Parishioners responded physically to the revival services by falling, experiencing the "jerks," dancing, barking, running, and singing when they came under the "power of the Spirit." So many people fell to the earth that parts of the revival grounds appeared to be strewn like a battlefield, bodies shook and convulsed, and some enthusiasts babbled incoherent speech. Skeptics, however, noted that more souls might have been conceived at Cane Ridge than saved. Each of the major denominations represented at Cane Ridge continued to organize similar meetings in the following years. As a result, thousands of Americans converted to the evangelical Protestant faith and many new churches were established, fueling the growth of Presbyterianism in the South and the explosion of the Methodist and Baptist denominations in the West.

Cane Ridge occurred as a semispontaneous, enthused event that represented church leaders' growing concern about the souls of their peers and Americans' increasing appetite for religion as they built a new nation. The Methodists made the most of this opportunity, creating an enormous network of churches through their brilliant organizational skill. Like the itinerants of the Great Awakening, Methodist preachers traveled from region to region spreading the gospel. However, rather than focusing on the spiritual state of the churched as had Edwards and Whitefield, Methodists worked hard at organizing the unchurched. As the American population sprawled westward, Methodist preachers called circuit riders took it upon themselves to ensure that the influence of the Christian gospel did the same. Their goal was to restore the "primitive church," freeing religion from the encumbrances of tradition and shaping it for the needs of the changing nation. The circuit riders divided up regions between them, overseeing multiple congregations at the same time since there were not enough ministers to match the nation's expansion. They traveled from church to church, stopping to preach whenever a crowd gathered. Between visits by the circuit rider, Methodist congregations met on their own for prayer and worship. If they had a skilled lay exhorter, he or she might occasionally preach. As a result of its democratic tendencies and its strong organizational efforts, Methodism appealed to Americans of all races and classes, becoming the largest American religious movement in the nineteenth century.

While Methodists built churches around the country, Charles Grandison Finney attempted to fuel the revival fires in the Northeast in the 1820s and 1830s. A lawyer by trade, Finney had a radical conversion experience. He then began preaching, leading a large revival in the boom town of Rochester, New York, where the Erie Canal had opened the way for rapid growth. Finney was an innovator; he encouraged women to testify in public, and he pioneered the use of the anxious bench—a bench placed at the front of the church where suppliants could contemplate their sinfulness and seek conversion. Finney's success may be partially attributable to the support of capitalists leading the market revolution engulfing Rochester. As workers gained more autonomy over their private lives, business leaders benefited from churches that taught workers to be temperate and reliable. However, religion seems to have been much more than an

opiate for the masses. Workers used religion as a liberating force in their lives and for opportunities to build relationships in their community. Finney later moved to Ohio where he became president of the new Oberlin College, a school that admitted men and women, whites and blacks. The college was also one of the nation's leading voices for social reform.

Revival affected the South as well as the West, transforming life in slave communities. Little noticed by whites, slaves responded to the democratic, egalitarian message of the Second Great Awakening in radical ways. Not content worshiping in the prescribed manner of their masters, slaves crafted their own network of churches and anointed their own religious authorities. They met secretly, often after dark, in shanties far from masters' homes where they were free to worship, to pray, to share news, and to testify. The religion slaves followed merged West African practices and beliefs with evangelical Christianity, which provided a framework for analyzing the hardships they faced and allowed them to take solace in each other and in their creator. The church inspired many of their most fervent calls for freedom and cultivated the leadership skills of men and women who orchestrated revolts. Throughout the nineteenth- and twentieth-century South, the black church served as the centerpiece of the African-American community. African Americans took the religious ideas and practices of their homeland and of the Second Great Awakening, blended them, and created their own religious movement that provided much of the basis for their economic, political, and social life.

Large numbers of African Americans in the North also found religion to be an empowering force. Independent black churches arose in part out of African Americans' growing impatience with racist church policies. One influential early leader was Richard Allen, who was born into slavery in Philadelphia. He was converted by Methodists and began preaching, eventually converting his own master who responded by allowing Allen to purchase freedom. He became a circuit rider after the war, and then returned to Philadelphia where he led prayer services at the biracial St. George's Methodist Church. As the congregation's black population increased, so did the racial animosity of the whites. Ultimately, the white church leadership began segregating the pews and altar areas. In 1787, Richard Allen and a number of his friends left St. George's in protest of its racial discrimination and started a church in a blacksmith shop. It led to the creation of the African Methodist Episcopal Church, which focused on both the spiritual and economic well-being of African Americans. The denomination became an important center of political and social support for the black community in America.

Women were also involved in the development of the black church. Jarena Lee, a member of Richard Allen's congregation, believed that God had called her to preach. Although Allen originally forbade it because of her gender, Lee spontaneously arose during a service and began preaching extemporaneously. Allen stood and told the congregation that Lee was as qualified as any of the men to speak. She then became an itinerant preacher, traveling with a message of revival. She wrote and published an autobiography, an unprecedented action for a black woman in this era.

Methodists were not the only people in North America attempting to elicit religious revival. When Europeans first landed on the shores of North America, they encountered a diverse set of cultures. American Indians lived in hundreds of different societies with distinct languages, cultures, and religions, sharing little in common. Over the centuries, however, they occasionally began to work together, creating new alliances in the face of their common threat. A consequence was Native American religious revitalization movements. One of the most famous began in the early nineteenth century when a Shawnee named Tenskwatawa started having visions. He claimed to know the key to Native survival: Indians must completely reject all of the cultural practices that they had inherited from Europeans. Dress, tools, dietary and religious practices were all to return to traditional Native ways if they wanted to protect their land. Tenskwatawa was aided by his bother Tecumseh, a powerful chief who had built a confederacy of tribes in Michigan, Ohio, and Indiana. Together the chief and the prophet organized a large coalition of Indians against whites in a political and religious alliance. Ultimately, however, they were defeated at the hands of the American military under the command of William Henry Harrison. U.S. soldiers decimated one of Tenskwatawa's critical towns, forcing the Natives to retreat. As a result, Tenskwatawa's power quickly declined, extinguishing the movement. Despite its political failure, this revitalization movement evidenced the Natives' growing frustration with white encroachment on their land and their savvy at organizing powerful religious and political alliances that unified quite diverse people groups.

The Nineteenth Century

The revivals of the early nineteenth century spawned many more unique religious movements. Visionaries,

unencumbered by the restrictions of previous generations, built utopian communities. Prophets looking to the sky were sure that the end of the world was near. In the mid-nineteenth century, despite growing tension and ultimately war, men and women adapted their faiths in unique ways, finding refuge from their surroundings in new expressions of religion.

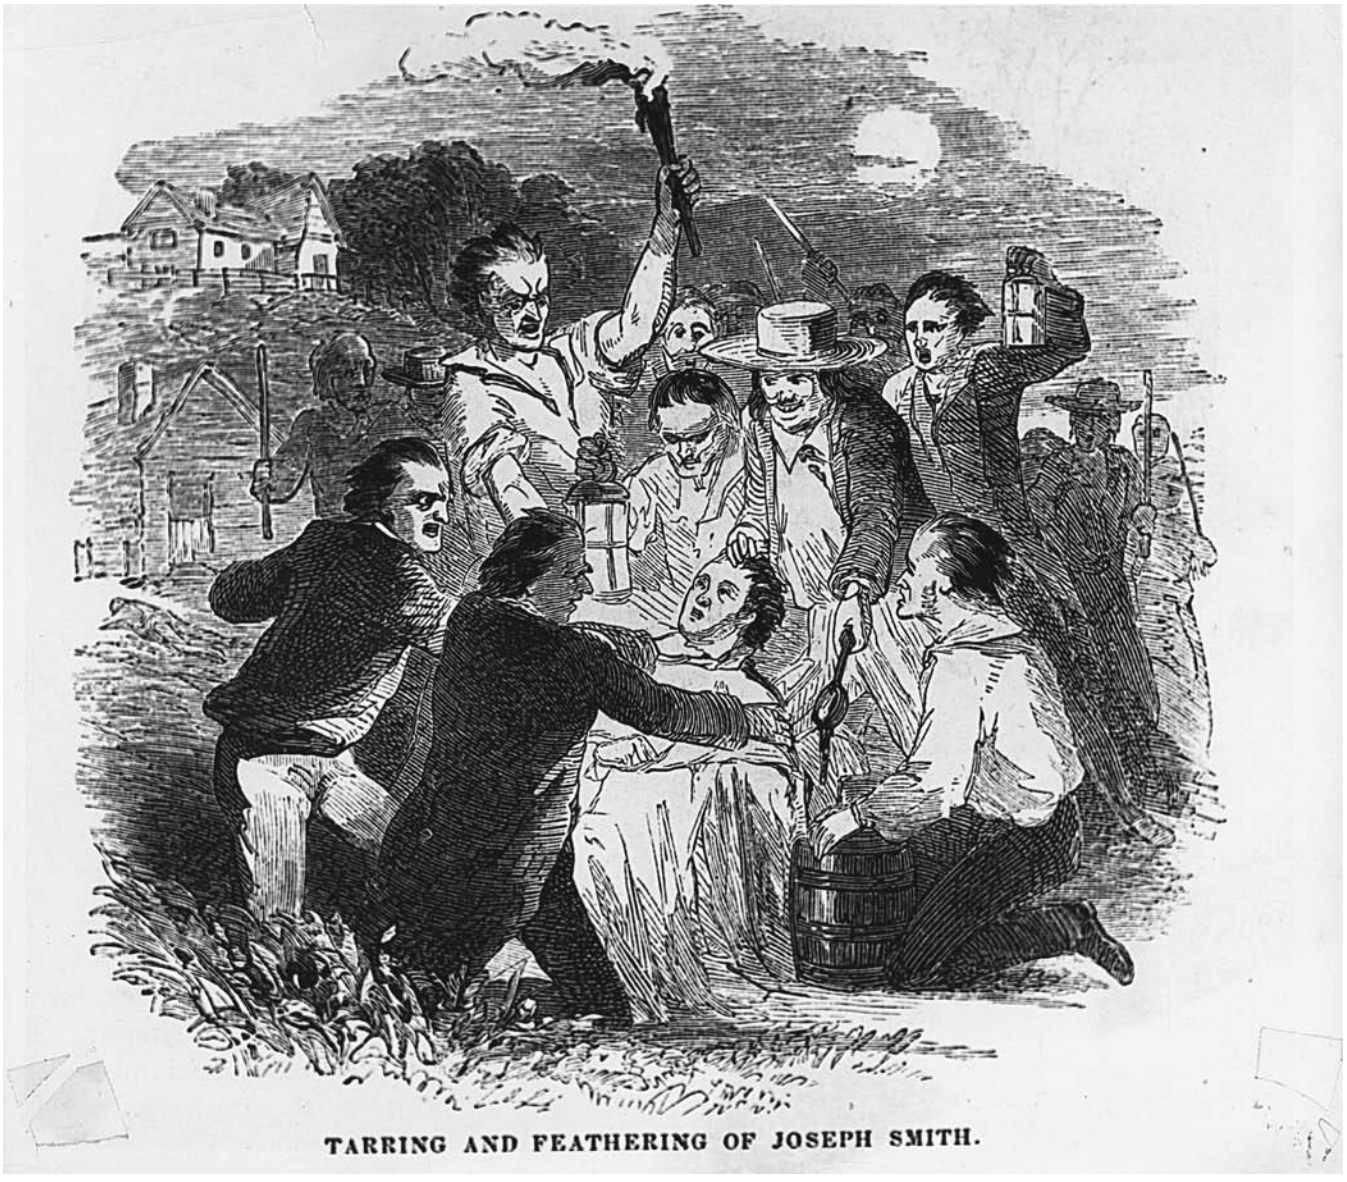
One of the most original and distinctively American religions is the Church of Jesus Christ of Latter-day Saints, whose adherents are more commonly known as Mormons. Joseph Smith, Jr., a poor teenager from upstate New York's "burnt-over-district"—named for the many revivals that passed through it—started the movement early- to mid-nineteenth century when he claimed to have received new revelations from God. Smith had been distressed by the competing and seemingly contradictory messages of local preachers as well as the social turmoil rural Americans faced as a result of the Revolution. He claimed to have seen a great light in the woods and later to have been visited by an angel named Moroni, who directed Smith to a secret location where golden tablets were buried. These tablets purportedly revealed the history of early America. Smith eventually translated the plates with magic stones, which became the basis for the *Book of Mormon*, a foundational text of his movement.

The *Book of Mormon* is a uniquely American work that blends civil religion and biblical themes with a few unique innovations. It teaches that Native Americans descended from members of the twelve Hebrew tribes of the Old Testament, some of whom traveled to America around 600 B.C.E. According to this book, the United States was therefore not a new Israel as the Puritans had asserted but was actually linked with God's original chosen people. America was a sacred place unlike any other in which the Almighty had revealed His new gospel. The *Book of Mormon* also contained an element of social protest. It attacked the class distinctions of the era and took organized religion to task for perpetuating and reifying inequalities.

Smith's ideas provoked a lot of opposition since most Americans believed that it was heretical to supplement the "divine revelation" of the Bible with new revelation, and since the Mormons engaged in controversial social practices. As a result, Smith was forced to lead his band of followers from place to place, seeking refuge and a peaceful region where the movement could blossom. In the 1840s, with over 10,000 followers, Smith was jailed and then killed by a lynch mob. Brigham Young, who replaced Smith as the Saints' leader, took the group to Utah where they established a permanent Mormon empire. In Utah the movement's growth exploded. The Mormons' commitment to hard work, a centrally planned economy, strong families, and a belief in their potential divinity led to their success. A religious group that was once on the outskirts of American culture, the Latter-day Saints are now as American as apple pie.

Although Smith achieved the greatest following, many other visionary leaders built social movements in the nineteenth century; among them were William Miller, Ann Lee, and John Humphrey Noyes. William Miller was a self-educated religious innovator. The strength behind his movement derived from his marketing skills and the scientific appeal of his ideas. A Baptist and a New York farmer, in the 1830s, Miller abandoned his land to become a lay exhorter. He traveled from church to church, proclaiming the imminent return of Christ. Crowds followed, generating excitement that was stimulated by the work of his publicist, Joshua Himes, who created elaborate charts detailing Miller's calculations for determining the date of Christ's return. These charts fed Americans' fascination with things that appeared "scientific." Using a rigid interpretation of the Bible as his guide, Miller calculated and publicized the day of Jesus's reappearance: March 21, 1843. When Christ didn't return as expected, Miller adjusted his calculations and placed the new date in 1844, but was again disappointed. Members of his Millerite group later reorganized themselves as the Seventh-day Adventists. Over the course of his life, Miller published over 5 million pieces of literature, including numerous religious tracts and a magazine.

Yet another visionary dedicated to Christ's imminent return was Ann Lee, who built a small following. Lee was illiterate and worked as a domestic servant. She lost four children during infancy, which caused her to question the appropriateness of sexual activity. Consequently, she began advocating total abstinence, both within and outside of marriage, and she also taught strict equality between the sexes. For a while she worked with a band of Quakers, whose trembling (or "shaking") during worship influenced her religious style. She later ventured out on her own, building a movement officially called the United Society of Believers in Christ's Second Appearance, but more often referred to as the Shakers because of their distinctive worship practices and stylized dance. The group lived communally and simply, holding almost everything in common. They led demanding lives, working hard and sacrificing much to support the community. Unlike groups such as the Latter-day Saints who gave birth to many children, the abstinent



An angry mob tars and feathers Joseph Smith, founder of the Church of Jesus Christ of Latter-day Saints, popularly known as the Mormons. Smith claimed as a child to have had revelations from God and been visited by an angel. Mormons were attacked everywhere they settled, and Smith was murdered by a mob in Carthage, Illinois, in 1844. *(Brown Brothers)*

Shakers adopted children in an effort to perpetuate the movement, but their growth was limited. The community eventually came to regard Lee as the incarnate Christ.

Similar to the Shakers in their communitarian emphasis was another nineteenth-century group, the Oneida Perfectionists, who sought to build an enduring religious movement. Led by John Humphrey Noyes, this group believed that people could live sinless lives, they practiced economic cooperation, and they sought divine healing. Noyes, like other religious leaders of the era, had a unique interpretation of Christ's second coming. He believed that Jesus had returned to earth in C.E. 70, which was the basis for his commitment to the attainability of perfection. More controversially, Noyes and his community also practiced "complex marriages" in which wives and husbands rotated between one another in the community. Opposed by their neighbors, they relocated to Oneida, New York, in 1848, where, in contrast to

many of the century's other utopian communities, the faithful at Oneida enjoyed economic prosperity for a time. They built steel traps and the still popular Oneida silverware. However, by the end of the century, the movement had mostly dissolved.

As pioneers ventured out on their own, others sought to reform more mainstream religions. One of the central strands of the era, human perfectionism, had a tremendous impact on men and women like Noyes as well as on American Methodists. John Wesley, the founder of Methodism in Europe, encouraged Christians to strive for perfection in their lives. As a result, Wesleyans emphasized the sanctifying work of the Holy Spirit after conversion and attempted to embody absolute love for God and one's fellow human beings. Combining the century's optimism with its religious creativity, the holiness movement emerged from this strain of Methodism. Holiness's most popular teacher was Phoebe Palmer, a woman who had a postconversion experience in which she claimed to feel the Holy Spirit's power. She then began teaching other women about her experience and eventually taught men too, inciting a renewed effort toward perfect living. A popular lecturer, she went on numerous tours around America and published many books. Among her lasting contributions to the nation's religion was a biblically based defense of women's right to preach. Holiness advocates like Palmer also believed strongly in missionary work, and they engaged in many of the moral reform movements of the era.

The Progressive Era

After the Civil War, the United States' immigration patterns shifted. More and more people began arriving from Central, Eastern, and Southern Europe in contrast to the previous generations of newcomers who had more often originated from Western Europe. On the West Coast, Asians arrived in great numbers, answering American business's call for inexpensive laborers. With the evolving immigration came new religious trends. The country's Jewish and Catholic populations, which were already sizable, surged. At the same time, new religions from other parts of the globe arrived for the landmark 1893 World's Parliament of Religions, held in Chicago. Out of this increasingly pluralistic context and fueled by continuing heavy immigration, many new social movements emerged.

Jews were among the major groups benefiting from the new immigration. They had been on American soil since the seventeenth century, migrating like many other groups in hopes of practicing their religion freely. In the mid-nineteenth century, a new, distinctively American, movement called Reform Judaism developed. Proponents of Reform Judaism sought to make the ancient faith more compatible with modern American life through numerous changes. They used English rather than Hebrew for their services, they initiated mixed-gender seating, and most controversially they denied the actual personhood of the Messiah. Instead, Reform Jews believed that the Messiah was the religion itself. A leading advocate of these alterations was Isaac Mayer Wise, who founded Hebrew Union College in Cincinnati to shape and perpetuate Reform Judaism. The movement appealed to many older generation Jewish Americans who sought to integrate their beliefs more thoroughly with American culture. Through Reform Judaism, they were able to practice their historic faith without isolating themselves from the surrounding society.

Not all Jews, however, found this movement appealing. Reform Judaism was especially problematic among the newer immigrants arriving from poorer parts of Europe. They were troubled by the Americanized changes and believed that such "reforms" did little more than dilute the faith. These religionists insisted on keeping the genders segregated during worship, on obeying all 613 laws prescribed in the Torah, and on using Hebrew for worship services. To distinguish themselves from Reform Judaism, they began calling themselves Orthodox Jews. They settled primarily in the nation's major cities, forming close-knit communities where they could protect their religious traditions. A third group, called Conservative Jews, embodied a sort of synthesis between Reform and Orthodox. Also emerging during the late nineteenth century, they interpreted the Torah more loosely than their Orthodox brethren, and they placed significant value on the nonreligious elements of Jewish culture.

As the Jewish population in the United States increased, so too did the size and power of the Roman Catholic Church. Between 1870 and 1910, it quadrupled. Because the Catholic Church had historically penetrated so many different cultures, it found a variety of expressions in America. As Catholic Europeans poured into the country, they developed their own national churches based on ethnicity, which functioned as religious, as well as social, political, and economic strongholds for the local community. Diverse groups of Poles, Irish, and Italians all maintained their autonomy and yet struggled together to defend their faith in the face of the dominant, sometimes hostile, Protestant culture. Meanwhile, turmoil and revolution in Mexico pushed Catholic Latinos into the Southwestern United States, where they practiced their own

culturally distinctive form of the faith. Each of the various Catholic ethnic groups sought to promote their beliefs among younger generations in America and, at times, battled each other for control of the Church in the United States. They built shrines, celebrated holidays, and organized parades to demonstrate their religious devotion and to honor their local traditions. They also proved to be capable institution builders, establishing thousands of parochial schools and a number of colleges to raise their children in the faith.

As Catholic immigrant groups adjusted their religion for a new context, so too did America's Natives look for creative ways to build and sustain their religious lives. In the late 1800s, a widespread social movement similar to the revitalization movement earlier in the century linked religious ideas with a political agenda. The movement began when a Nevada Paiute named Wovoka had a series of dreams in which he traveled to a utopian land full of wild game and resurrected Indian ancestors. He returned from this paradise with an edict for his fellow Indians. They were to stop fighting with each other and with whites. Instead, Wovoka taught them a sacred practice, called the Ghost Dance, which was supposed to drive the whites away, to restore the land, and to reunite the Indians with their ancestors. The Ghost Dance spread, bringing political ramifications. The Sioux believed that through their practice of the Ghost Dance, they would be invincible in battle. As a result, they engaged in bloody confrontations with the American military, which concluded in a massacre of Natives at Wounded Knee, South Dakota. The Ghost Dance, like many of the other utopian movements of the nineteenth century, left its adherents disappointed.

Similar to Native Americans and Jewish and Catholic immigrants who modified their faiths to fit their particular social circumstances, a group of white, somewhat elite Protestants, did the same. In the Progressive Era, good physical health was a highly prized commodity, and in every newspaper and on every street corner thousands of people offered myriad cures, remedies, and practices for attaining it. Christian Science, developed by Mary Baker Eddy, became a popular religious movement driven by Americans' concern with their well being. As a child Eddy struggled with poor health and found few answers in mainstream American religion or in medicine. She eventually met Phineas P. Quimby, a folk healer who believed that reality was no more than an idea pervading from God's mind. He also reasoned that God was absolutely incapable of error, suffering, or death. Taking Quimby's ideas to their logical conclusion, Eddy believed that suffering was therefore just an illusion. She articulated a corresponding interpretation of Jesus. He was not God incarnate, but the model human who understood such ideas. She published her teachings in a series of books, the most important of which was called *Science and Health, with Key to the Scriptures* (1875). Although the Christian Science movement spread around the nation, Eddy was most popular in the Northeast, especially among the wealthier classes. Christian Science appealed to the many men and women hoping to recover from the ailments of the era.

Confronted with the rapid growth of other religions and new sects, traditional American Protestants, whose constituencies were declining, faced an identity crisis. Theological and philosophical trends sweeping the nation further contributed to their identity crisis. The growing popularity of Darwinian evolution and the application of literary criticism to the Bible became divisive issues that would eventually sever many churches and even some denominations. On the one side were the fundamentalists, who rejected contemporary trends and maintained a literal approach to the Bible. They were willing to fight for their beliefs, refusing to let modernism seep into their churches, schools, or homes. On the other side of the debate were the liberal Protestants, or modernists, who were broadly characterized by their efforts to keep their faith up-to-date with the latest scientific and philosophical movements. Like Reform Jews, they wanted to contemporize and apply their faith to the modern world. Ascribing generally to either the modernist or the fundamentalist movements, dozens of smaller Protestant submovements emerged. Two of the most influential were the Social Gospel and Pentecostalism.

The Social Gospel was a revival of sorts that developed out of mainstream Protestants' efforts to meet the demands of a changing nation. The United States, like Europe, faced increasing economic inequality, abysmal healthcare, dangerous working conditions, exploitation of workers, and unrestrained, rapid urban growth, triggering clerics' movement out of their church and onto the street. The Christian gospel, they believed, was not just about a person's relationship with God but also about his or her social relationships. These men and women taught Christians to engage their faith with culture and to think about the social message of the scriptures. The Social Gospel in-

fluenced many of the classic Protestant denominations, but its most obvious expressions surfaced through interdenominational organizations. The Men and Religion Forward Movement of 1911–1912 (which linked a form of "muscular Christianity" that emphasized the strength and virility of Jesus with the Social Gospel) and the Federal Council of the Churches were two leading organizations with strong Social Gospel components. Through such interdenominational agencies, the movement accomplished many things. It revived Protestant liberalism and reshaped the role of the church in society. Religiously inspired men and women established schools for all ages to educate the new urban public, while settlement houses were built for the poor. Northern churches created schools in the South for African Americans who otherwise received little help. Some leaders immersed their churches in political issues like suffrage, prohibition, and expansionism, while others were more subtle about their politics. Social action groups, missionary societies, and student organizations were established or expanded under the auspices of the movement. From church pulpits, seminaries, street corners, and the academy, Social Gospel leaders attempted to convert all who would listen to a new way of life.

Pentecostals, on the other hand, were linked to both the emerging fundamentalist movement and the Holiness movement. They subscribed to most of the same beliefs about the Bible's inerrancy as fundamentalists; they too claimed to interpret it literally, and they rejected many of the intellectual and cultural trends of the era. Their distinguishing feature was an emphasis on what they called the Baptism of the Holy Spirit. Like Holiness folks, Pentecostals believed that after conversion, a person gained a sense of empowerment derived from the Holy Spirit. They were subsequently able to exercise the spiritual gifts listed in the New Testament, the most prominent of which was speaking in tongues. With strong organizations, charismatic leaders, a somewhat more racially inclusive attitude than many other Protestants, and the appropriation of new technologies, Pentecostalism became one of the most vibrant social movements in the twentieth century.

Modern American Religious Movements

After World War II, many of the religious movements developing in the Progressive Era continued to expand. In the mid-1950s, sociologist Will Herberg published *Protestant, Catholic, Jew: An Essay in American Religious Sociology* (1956), which argued that America was no longer a religiously monolithic nation, but a pluralistic country composed primarily of the three major faiths constituting his title. However, little did Herberg know that America was on the verge of a new explosion of religious diversity. In the 1960s, Congress passed legislation that reformed America's immigration laws. Nonwhite, non-Protestant religions flourished as quotas favoring the immigration of Europeans and restricting the immigration of Asians and other national groups came to an end. The result has been a revolution in religious diversity in which America's pluralism has emerged from back alleys and moved to Main Street. Islam, Hinduism, and Buddhism are three groups that illustrate this change, while other Americans have reached out to the New Age movement for answers.

Islam is one of the fastest growing of America's "new" religions. Muslims have been on North American soil for hundreds of years, but their numbers remained small until Progressive Era immigration brought additional Muslims from around the world to America. Most settled in the urban cities of the North and in California. For centuries they remained primarily in the shadows, living in close-knit communities where they tried not to draw attention to themselves. In recent decades, this pattern has reversed itself. Muslims have erected thousands of mosques, developed thriving student movements, and established influential community organizations. As it has integrated into American society, Islam has evolved in particularly American ways. Muslim women participate more in public life than they do in traditional Muslim countries and worship centers, and services have taken distinctly American tones. Muslims have reconceptualized their faith to make it relevant for a generation of children born and raised in the United States.

One offshoot of historic Islam is the American-based Nation of Islam. This movement appeals primarily to urban African Americans who have rejected more mainstream American traditions. Although Islam has prospered among Africans and African Americans for centuries, it experienced a significant revival during mid-century under the mysterious Wallace Fard and his successor Elijah Muhammad. In 1930s Detroit, Fard established a Temple of Islam, which drew parishioners from the city's working-class black population. Fard taught that blacks were God's

highest creation, whereas whites were an inferior offshoot. The movement capitalized on widespread black identity movements, which critiqued mainstream American religion for its pervasive racism. Under Elijah Muhammad, the Nation of Islam established a new headquarters in Chicago. A brilliant leader and organizer, Muhammad integrated the Qur'an with the Bible and reshaped some of the major creeds and holidays of the faith to mold them for an American population. Malcolm X became one of the Nation's most popular spokespeople. The movement's success lay foremost in its practicality. Muhammad taught his followers the values of hard work, economic independence, and a strict moral code. Although controversial, the Nation of Islam has subsequently transformed many inner-city areas, helping the black community defend itself against the hegemony of the dominant culture.

Like the world's other major religions, Hinduism has been present on American soil for generations. In the nineteenth century, Transcendentalists like Ralph Waldo Emerson were influenced by classic Hindu texts; however, there were few practicing Hindus in the United States until Indians began migrating to North America in the Progressive Era. Hindu Swami Vivekananda came to the United States for the 1893 World's Parliament of Religions, where he was well received. Sensing unparalleled opportunity, he established the Vendanta Society in America, which sought to influence the West with his ideas that emphasized the ultimate unity and peace of all things. He taught religious practices including yoga, which has found widespread popularity in the United States. Yoga consists of physical and breathing exercises that are designed to relax the body and to bring about a state of total concentration. Since the immigration reforms of the 1960s, numerous other gurus, or religious leaders, have arrived in the United States where they have built small followings. Although many immigrants practice Hinduism, the religion has also appealed to white Americans who reject Christianity for what they find to be a more peaceful, holistic religion from the other side of the globe.

Adding to America's religious diversity is Buddhism, whose adherents first arrived in significant numbers in America during the eighteenth century. Chinese immigrants entering California and Japanese laborers seeking work in Hawaii continued their religious traditions in the new land, adapting as had just about everyone else to novel social circumstance. Temples were erected in places like San Francisco where Buddhism blended with other traditional Asian religions. Missionaries also arrived from the East, hoping to convert Americans to their faith. Over time, Buddhist immigrants reshaped their religion in America in traditionally "Christian" ways, building "churches," anointing "bishops," and holding Sunday services complete with Sunday schools.

One of the more popular and elite social movements emerging from Buddhism was the Zen movement. Zen had been represented at the World's Parliament of Religions in Chicago, and over the coming decades a few pioneers worked to popularize it in the United States. The foremost leader was Daisetz Teitaro Suzuki, who wrote many books in English about Zen and lectured in major universities. San Francisco "beat poets" of the 1950s such as Allen Ginsberg and Jack Kerouac began practicing and popularizing a form of Zen. Shunryu Suzuki, a Japanese religious teacher, established one of America's first Zen religious centers in San Francisco in the 1960s where practitioners would sit and meditate in traditional postures, seeking to clear their minds and to achieve enlightenment. The movement places little emphasis on religious texts or artifacts but is instead based on concentrated meditation, often on a paradoxical question. As Zen's popularity grew among educated, young, white Americans, the movement engaged in social issues such as the AIDS crisis and the environmental movement.

Among the most influential religious movements in the last part of the twentieth century was the New Age movement. Although it has roots in America's long-standing metaphysical tradition, the modern New Age movement began in the late 1960s and early 1970s, a period when many Americans were being challenged to rethink their traditional religious beliefs. Frustrated with mainstream religions, they reached out for something that seemed more authentically "spiritual." The New Age movement evades definition and consists of countless religious ideas and practices that adherents appropriate selectively. Some New Agers express their beliefs through environmental activism or holistic health practices, whereas others look to channeling or astrology. Many practitioners emphasize positive thinking and look within themselves for transformation rather than to a religious community. Although they usually deny the supernatural worlds of more traditional religions, New Agers commonly believe in a different type of transcendent, extraordinary dimension of entities—for example, many believe in the existence of life on other planets and UFOs. The immigration of religious teachers from all over the world, the revitalization of

Native American spirituality, and the rise of the holistic health movement opened many people's minds to new ideas, fueling the birth and growth of the New Age movement.

Social movements based on religion have defined America. Thousands of pioneers have emerged, some manipulating historic faiths, while others built entirely new movements. Some have enjoyed tremendous success, while others have faded into oblivion. Heavy immigration, charismatic individuals, strong organizations, and protection against the establishment of a single religion have allowed thousands of religious movements to thrive in North America.

Religious Movements 1730s–1830s

The eighteenth century in America was a time of awakening from the slumber of the past. Light was shed on the darkness of superstition, irrationality, autocracy, aristocratic privilege, and dogma. The individual, weighed down by the chains of time, institutions, thought, and traditions, became unencumbered and liberated. The new science taught Americans the value of reason, the laws of motion, and the tools of empiricism. Political and social philosophers on both sides of the Atlantic discovered the laws of nature that applied to society and government. Religious thinkers broke from the constraints of orthodoxy, presenting Christians with the gift of choosing how best to recognize, worship, and serve God. The Great Awakening, beginning in the 1730s, was a reaction to the limits of the past and to the social and economic constraints of the present. The awakeners shared a vision of a society based on the recognition that God's will was the basis for human actions, thought, institutions, history, and existence.

Calvinists and Puritans

American history seemed indeed to be shaped by the will of God. So argued seventeenth-century New England Puritans such as William Bradford (in *Of Plymouth Plantation,* completed in 1651, though not published in full until 1856) and Cotton Mather (in *Magnalia Christi Americana,* 1702), who believed that divine providence led religious reformers to America to fulfill the visions of the first Protestant reformers, in particular John Calvin. As Jeremy Belknap wrote in his *History of New Hampshire* (1784), "It is happy for America that its discovery and settlement by the Europeans happened at a time, when they were emerging from a long period of ignorance and darkness. The discovery of the magnetic needle, the invention of printing, the revival of literature and the reformation of religion, had caused a vast alteration in their views, and taught them the true use of their rational and active powers." Similarly, Calvin believed that God shed light upon His will and His works for those who could discern it and act upon such knowledge for the sake of His kingdom. Calvin thought that the cornerstone of the Protestant Reformation was the individual examination of God's holy word in Scripture and in nature. The awareness of what is the true and original expression of Christianity would lead to active reformation of those abuses in contemporary Christianity that were inconsistent with God's will and word. Calvin, educated in French legal scholarship and the texts and assumptions of the Renaissance, envisioned congregations of devout Christians working in concert to achieve virtue in civil society that was never accomplished by secular governments. These saintly citizens of the "Bible commonwealth" were to reform the world according to the model of the heavenly city of God found in the Old Testament and New Testament. Calvin and his followers organized these self-perceived Christian "saints" (those bound for heaven) into active soldiers fighting for the word of God. This joining of political and social concerns and actions with deeply held religious beliefs had a revolutionary impact on Europe, England, and America.

Calvin's followers in England, for example, sought to purify not only the Roman Catholic Church but the Church of England (the Anglican Church) as well. Each congregation of these "Puritans" performed illegal, treasonous actions in refusing to abide by all of the requirements of the Church of England, which included use of the Book of Common Prayer and obedience to the hierarchy of church authorities, culminating in the Archbishop of Canterbury and the Crown. Puritans believed in action to accomplish God's will. Their singular devotion to a perceived divine cause resulted in dramatic consequences, the two most important of which were the English Civil War and the Puritan migration to North America.

American Calvinists such as John Winthrop saw in the examples of the Old Testament patriarchs and the teachings of the New Testament apostles models for uniting political and religious order under one system of government. The "New England Way" was very close to a theocracy, basing governing on religious belief and participation in religious activities. These first New England Puritans perceived themselves engaged in an "errand into the wilderness," a notion that continued to guide religious and secular thinkers alike in coming centuries. The errand was to create a religious commonwealth, to civilize and hence Christianize the wilderness and its native peoples, to stay true to the covenant that united themselves to God, to exercise constant restraint in material and secular matters, and to reform as much as possible human institutions.

As the decades passed, however, the errand into the wilderness was forgotten and ignored, its institutions altered, its ideals trod upon. Some Puritan ministers called upon the flock to repent and to form a new covenant with God, but in vain. Change forever has an impact on religious beliefs and institutions. The anxiety and uncertainty of sixteenth-century Europe brought about a religious response, the Protestant Reformation. Likewise, social, economic, political, and intellectual changes in America during the late seventeenth and early eighteenth centuries brought about varying religious consequences. Trade grew, particularly with England. Merchants became wealthy, inspiring in others the same goal. Population expanded because of immigration, better diet, and growing medical knowledge. As a consequence, cities emerged from the wilderness.

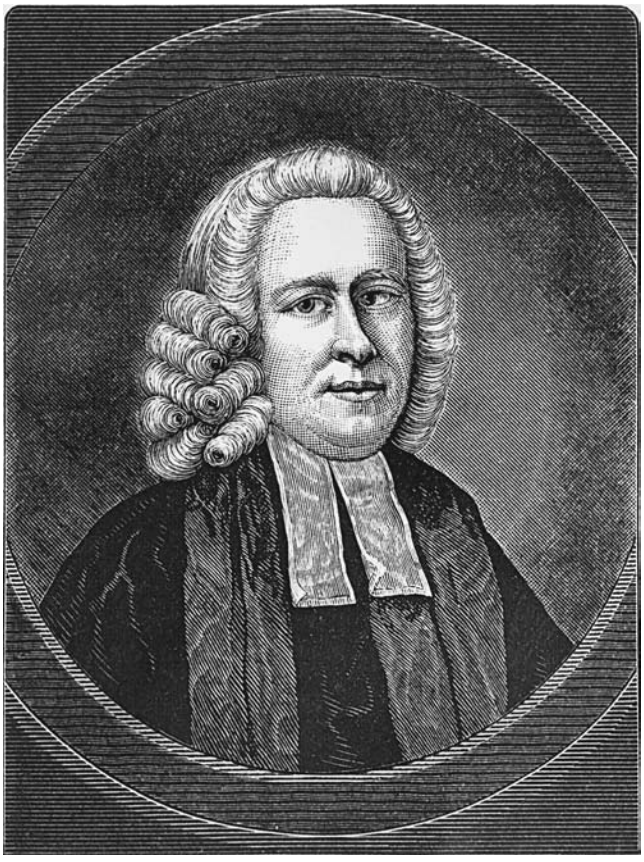
Success breeds jealousy and aggression among contestants for land and wealth. British Americans contested with Native Americans and French Americans over the rich frontier and important waterways of the Piedmont and lands west of the Appalachian Mountains. Wars in Europe yielded wars in America. The expanding frontier brought with it a host of political problems. Meanwhile, Americans became aware of new ideas in science about the universe and its governing laws; in the philosophy of science and government; and in the origins, progress, and significance of Christianity. Bombarded by the new and unknown, uncertain as to what were right and wrong, good and bad, some Americans rejected Christianity as untenable; others embraced it all the more. Such was the setting for the Great Awakening of the 1730s and 1740s.

Old Lights and New Lights

George Whitefield, an itinerant preacher from England, personified the uncertainty and restlessness that resulted in the Great Awakening. A man without a parish in America, a wanderer intent on attracting notice by dramatic speeches rather than solid theology, Whitefield caught the attention of masses of men and women, young and old, seeking release from life's daily drudgery, searching for alternatives to the sermons of college-educated clergy who always had the same message. Whitefield was different. Theology meant little to him. Denominational distinctions, the intricate variations of the sacraments, the learned discourses of the educated, were meaningless next to the horror of the dread consequence of sin and the joy of salvation through Christ. Whitefield's appeal to the emotions fit well the character of a people devoted to the practical and commonplace who eschewed thought for action, who were experiential and intuitive rather than logical and sophisticated. Whitefield tapped into common American qualities that transcended the individualism of a capitalist, frontier society.

Imitating Christ in his choice of venue, Whitefield preached in open spaces, fields, and meadows. Farmers journeyed from far and wide in response. Whitefield's discourse, filled with imagery and drama yet void of doctrinal intricacy, fit well in such unpretentious, familiar surroundings. People listened in common and responded en masse. The old ways of religious habit and perfunctory faith, a nod to God on Sunday and a return to sin on Monday, vanished as the multitude felt anew the presence of a Redeemer disgusted with the sinful neglect of His people, demanding wholehearted repentance and complete abandonment to His will.

Some forms of Christianity have thrived on fear, guilt, loneliness, and despair. The Great Awakening brought such suffering, an awareness of its causes and consequences, to the surface, where it lost its illusory singularity and achieved common recognition. Personal anxiety, fear, suffering, and pain were revealed as universal human experiences. One could sob and wail in the open, surrounded by strangers, and yet feel the comfort of releasing a burden to one's intimate friends. Surprised by joy amid suffering, one could laugh and shed tears of happiness without embarrassment. Religious affectations became emotions to share with others rather than to experience in private. This was an "awakening" of fundamental hu-



Speaking up and down the colonies in open fields and meadows, George Whitefield drew large, enthusiastic crowds in the late 1730s and 1740s. His emotional sermons—filled with imagery and drama and void of distinctions based on class and wealth—fueled a religious revival known as the Great Awakening. *(Brown Brothers)*

manness. New light was shed upon the darkness of the soul.

Jonathan Edwards, the Yale-educated pastor of Northampton, Massachusetts, understood these feelings of loss and hope, repentance and redemption, the abandonment of self to God, that were products of the "New Light" experience of the Great Awakening. In *A Treatise Concerning Religious Affectations* (1746), Edwards argued that the emotions rather than the intellect were the true foundation and expression of religious belief. Who can have an intellectual understanding of the Incarnation or the Resurrection? One can only feel Christ's sacrifice, empathize with it, and make the experience one's own. In *A Divine and Supernatural Light* (1734), Edwards showed that reason relies on intuition, that thought is dependent on emotion. Knowledge of God comes from God, who makes Himself known in the human heart and soul; only later does the mind acquire recognition. Edwards's *Personal Narrative* (1765) provides wonderful insights into his own religious journey, his abandonment of reason and thought to his base feelings of sin and depravity, and his joyful emotions of healing and redemption through Christ, not self. Yet Edwards's *A Faithful Narrative of the Surprising Work of God* (1737), which focuses on the revival in Northampton, describes the Great Awakening as a group rather than an individual phenomenon.

For some clergy, the emotional response of tears and wailing and writhing on the floor of the New Lights did not fit at all the decorum, piety, and restraint required of the pilgrim when worshipping in the house of the Lord. The Boston clergyman and theologian Charles Chauncy responded to Edwards's joyful tracts with literary attacks on the enthusiasm, spontaneity, and emotions of the masses. The uneducated common herd of humankind could hardly know how best to worship God. Emotion is not an adequate tool to measure God's will and ways. Christ requires piety, forbearance, silence, reason, order in His worship, he stated. Chauncy's *Enthusiasm Described and Caution'd Against*, published in 1742, was welcomed by the solid middle and upper classes, the well educated and professionals, who were suspicious of the immediacy of New Light religious conversion. Their experience taught them that God revealed Himself to the intellect, not the emotions. Conversion took time; it was a subtle occurrence rarely recognized until by learned hindsight one could trace it and accept it. Chauncy and other Old Lights, content with the ways of their fathers, could hardly accept Edwards's description of hell in *Sinners in the Hands of an Angry God* (1741), which was graphic, horrifying, and intent on eliciting the most emotional response. The uneducated lacked the intellectual resources to decide such matters of God's benevolence, justice, and love for themselves. The Old Lights refused to accept the logical contradiction of a just and loving God who condemns His children to unending torment in Hell. New Light arguments—that human sin is universal, inherited from the first man and woman, Adam and Eve; that all humans deserve condemnation; that God for unknown reasons mercifully saves some from hellfire; that humans do not have the free will to determine their own eternal fate—did not accord with a rational God currently being fashioned in Europe and America by Arminians and Deists. Chauncy and the Old Lights, raised in the Calvinist theological environment of Congregationalism, slowly rejected Calvin's claims

and the revolutionary consequences of Calvinist social thought.

Religion and Revolution

Indeed, it is not surprising to learn that as the eighteenth century progressed, the Old Lights were less apt to embrace the revolutionary political arguments of Whig statesmen. In contrast, the New Lights could accept the paradoxes and dangers of the American Revolution simply because their theology taught them that life is full of paradox, that human reason is limited, that God Himself threatens all of His sinful children with eternal damnation, that security in mind, body, society, and institutions is illusory. The Great Awakening taught its adherents that God does not respect class, inheritance, fame, and power. All humans are equal in respect to God, who alone is separate, elevated beyond all others. New Light religious beliefs did not allow them to accept the pretensions to power and rank of the British aristocracy, the House of Lords and House of Commons, and the King. Politics made little sense without religion, and if religion taught equality among all men and women, politics must follow. The revolutionary tendencies of the Great Awakening spilled over into the revolution against Great Britain.

Neither theology nor politics is black and white—and sensitive eighteenth-century Americans often found themselves caught between the Old Light/New Light debate as well as the struggle between Loyalists and Patriots. It was difficult to reconcile the order and decorum at the meetinghouse on Sunday and the disorder and chaos of town meetings on Monday. Some Old Lights such as the Boston clergyman Mather Byles, refusing such contradiction, became notorious (if consistent) Tories. Others, such as the New Hampshire pastor Jeremy Belknap, sought ways to avoid the confrontation of religion and politics by questioning the traditional beliefs of their fathers. Belknap was raised in the still Calvinist environment of mid-eighteenth-century Boston. He was descended from Increase and Cotton Mather on his mother's side. As a communicant of South Parish, he found a mentor in the Reverend Thomas Prince, a clergyman interested in science and history. At Harvard College Belknap discovered the writings of Jonathan Edwards, which inspired in him a search for God's saving grace. His great uncle Mather Byles counseled the young pilgrim not to seek the type of emotional conversion described by Edwards. But Belknap was dissatisfied with a rational approach to God. He refused to consider the ministry until he experienced the saving change of God's grace, which occurred during the long New England winter days of 1766. Belknap became the pastor of the First Parish of Dover, New Hampshire, in 1767 and proceeded to try to inaugurate an awakening among his parishioners. But Dover was not Northampton. Belknap found a few close associates willing to allow emotion and intuition to guide them; but his religious zeal alienated many others.

Eventually, Belknap, like many clergymen, turned his religious zeal toward political issues. Like many of his colleagues of the cloth who were alumni of Harvard or Yale, he became a firm, if conservative, patriot. The pastor and his family suffered economic privation during the war and rarely were free from the dismal feeling of possible doom should the British gain the upper hand in the war. Belknap's solace was his historical and scientific studies. But as a clergyman he was called to study the Scriptures as well. One bleak day in 1778 Belknap experienced a revelation while reading the book of Daniel in the Old Testament. He felt sure that Daniel prophesized the eventual defeat of Britain and American independence. In other words, it was God's will that America become free. Excited and astonished, Belknap preached a sermon and told his friends and family about his insight. For the remainder of his life, twenty years, he lived according to this revelation of the divine will.

That the divine will might enter into and direct society and government was not a new idea. Pagans and Christians, Muslims and Jews, if devout, rarely purposefully act in contradiction to what they perceive to be God's will. The uniqueness of the Protestant Reformation was the range of interpretation of God's will. Calvin channeled the perception of God's grace that he and his fellow "saints" had purportedly experienced into an active crusade to spread Christianity and the awareness of God's will on earth. It is slightly absurd, of course, to proclaim the omniscience and omnipotence of God and in the same breath proclaim that notwithstanding the limited perspective, clouded by time and sin, of one's life one still knows God's will. Some Christians, both New Light and Old Light, turned their freedom of the will into God's will, and vice versa.

Jonathan Edwards, in his essay *Freedom of the Will* (1754), argued that free will, which obviously exists, is not "will" itself, just as human goodness is not "good" itself. These were not new ideas. What was new was the unique situation of eighteenth-century America. Edwards and his parishioners felt the presence of the Holy Spirit, God's overwhelming will, even as they felt called upon to exercise their respec-

tive freedom to choose. This differed from John Calvin. One senses from Calvin's *Institutes* a sense of the inexorable will of God that no human can reject. Calvin needed the help of the community of believers to substantiate this feeling that he was chosen, against his will, but according to God's will, to act for the sake of God and His kingdom. Calvin manufactured a kind of certainty amid all the overwhelming uncertainties of life. And yet he still felt a terrible anxiety knowing that his will was never perfectly free, yet bound to another.

Uncertainty and consequent anxiety are the sine qua non of life. Some respond in silence and humility, becoming a monastic in theory or in fact. Others give voice to their fears in writings and confessions, hoping to solicit a silent empathy from listeners and readers. Still others are driven by anxiety to join in common with others equally in despair, where numbers and a collective voice drown out solitary cries, giving energy, even if elusive and fleeting, to one's individual impulses. When one is afraid, it feels so much better to act when others are acting as well. Collective action gives legitimacy to individual actions. One person might not challenge the world, but a host can; one person might not challenge authority unless joined by countless others; one person might not speak in tongues, or scream and faint in the presence of the congregation, unless others have removed its singularity.

To do something strange or untraditional requires a certain anonymity, which the collective provides. If the Great Awakening had been the awakening of one soul to God, it would be a footnote, not a chapter, in the pages of history. Social, religious, and political movements require the subjugation of the individual self to the collective self, which ironically legitimizes and strengthens individual self-perception. Scores of people believing and acting give credence to the claim that it is God's will that drives such actions.

It felt good to Edwards to reduce his freedom to a single spark in the light of freedom. In a similar way, it felt good to Thomas Paine and Thomas Jefferson, and all the other patriots who rejected tyranny for freedom, to universalize their feelings, to make their cause *the* cause, to make their perceptions self-evident to all humans. Jefferson's Declaration of Independence reads like a religious tract in its focus on the will of the people, the necessity of history, the laws of nature and God. Some patriots, like Jeremy Belknap, applied Jefferson's secular, deist tone to a religious format. But clearly Jefferson's vague allusions to the divine and concrete images of human experience and action struck a chord with the mass of Americans, who by 1776 had been awakened to a recognition of God's will, no matter what form it might take.

Hence, the Great Awakening succeeded, but only through transformation, adjustment to the perceived realities of the Enlightenment. The enlightened thinker of the middle to late eighteenth century had come to realize the power of human reason. Yes, there might be this vague universal force, Reason, but it was distant, growing more anonymous, giving a perfunctory nod to Reformation and Revolution. Freedom of the will grew in stature before, during, and after the American Revolution. There might be a transcending Will, as the French believed in their Declaration of the Rights of Man and Citizen, which legitimized the violence of the French Revolution, but even this transcendent force was the general will of the people rather than the universal will of God.

Social and political movements still sought St. Augustine's *City of God* but with a secular twist. Theirs was a heavenly city, a utopia, on earth, where all humans would find happiness; disease, starvation, poverty, ignorance, would be eliminated. The millennium still beckoned; it could still be inaugurated on earth. The millennium of the enlightened philosopher of the eighteenth century, of the utopian thinker of the nineteenth century, was still eschatological, still divinely sanctioned, however vaguely. Yet this millennium lacked Christ. It lacked the Second Coming, the sound of trumpets, Armageddon, Judgment. It was a secular millennium that the philosophers and quasi-religious called for and expected.

The Self-Reliant Believer

Social and ideological movements of the late eighteenth and early nineteenth centuries were still caused by uncertainty about life, anxiety brought about by the fear of change and death, and the manifold wars, epidemics, famines, and the like of the times. The mind struggles to make sense out of disaster, mortality, and suffering, and it finds answers to fit the times. The answers of the early nineteenth century were of an astonishing variety: Deism, Universalism, Unitarianism, Transcendentalism, Millennialism, Mormonism.

The apparent diversity of these responses to the uncertainty and anguish of war, revolution, and industrialization should not blind us to their similarities. The groups who take political and social matters into their own hands, who rise up and revolt and realize their power, understand sovereignty not according to the exclusive right of kings and aristocrats but according to the inclusive right of all people. They

experience power as a possession, an expectation, a fundamental right. Having experienced such power, they will hardly relinquish it to others, human or divine.

The years before and after the American Revolution, then, hosted the unabashed awareness of the power of the human mind. Deists allowed human reason to penetrate all facets of the human and natural past. Thomas Paine referred to his time as *The Age of Reason* (1794), where superstition and the supernatural took a back seat to science, mathematics, historicism, and empiricism. "My own mind is my own church," he proclaimed. Unitarians used logic and experience to proclaim that God is a Unity rather than a Trinity. Universalists assumed that their kind of God would not contradict human expectations of goodness and justice in condemning humans, both guilty and not guilty, to eternal torment in hell. Unitarians and Universalists, like Transcendentalists, ignored revelation, sources of truth and inspiration such as the Old Testament and New Testament, preferring instead their own reason and experiences to gauge what is truth and what is falsehood, what is divine and what is not. Taking a page from the Old Lights, the Unitarians and Universalists could not countenance beliefs and institutions based on the fundamental assumption of human sinfulness, for humans are inherently good, and Adam's fall has no bearing on the present.

A good example of the movement toward a less rigorous Christianity, a more accommodating spirituality of love, goodness, and peace, was the Transcendentalist Henry David Thoreau. Thoreau and his friends and associates, such as Ralph Waldo Emerson, believed that the route to truth lay within the human heart. Intuition, not reason, not revelation, not tradition, taught the individual self what to believe and how to act. Self-reliance, independent thought, personal authority, personal knowledge: these were the credos of the early-nineteenth-century Romantic. Thoreau and his associates rejected the rationalism and empiricism of the Enlightenment thinkers and Old Lights as well as the energetic acceptance of God's will of the awakened New Light for the self in search of meaningful human experience. The only authority was the scripture of self, searching for and finding God within oneself via the conduit of nature. Emerson felt "perpetual youth" in nature and childlike innocence as well. Sacrifice, suffering, atonement, redemption, crucifixion, and resurrection blend in and become lost in the untold variety and plenty of nature, where all is good and life is peace. The phenomenon of social movement—the idea of a Great Awakening—was ignored and became inconsequential to Transcendentalists such as Thoreau and Emerson.

Self-reliant philosophies such as Unitarianism, Universalism, Deism, and Transcendentalism could hardly sponsor—rather, they could only eschew—the religious concerns of the mass of people. In retrospect, a Second Great Awakening was inevitable given the confident, passive tone of early nineteenth-century religion and philosophy and at the same time the overwhelming anxiety caused by modernization. Americans, particularly in the northern states and especially the growing middle class, were going through a dramatic period of questioning and seeking answers. Independence brought with it a host of concerns. How could a society based on the Declaration of Independence, the Constitution, and the Bill of Rights sponsor such glaring abuse to people of color, slave and free? How could the factories of the North continue to rely on the raw materials of the South grown through human suffering and despair? What would be the price of the coming Industrial Revolution? How could Americans avoid unstoppable growth, urban blight, increasing poverty, and inequality? How best could ambitious young people best utilize their talents and energies in a society and economy exploding to the west, up rivers and canals, over the Appalachians, down the Ohio and Mississippi, up the Missouri, across the Rockies? The decade of the 1830s repeated the experiences of the 1730s—the change, the anxiety, the search, the discovery, the "answer."

New Religious Stirrings and the Second Great Awakening

For some Americans, the answer to economic and social change was religious change—a new ideology, new scripture, new church, new life. John Humphrey Noyes at Oneida, New York, headed a community of believers who reveled in their perfection—and their sexuality. Shaker communities in New England practiced celibacy and awaited Christ's imminent return. Joseph Smith proclaimed his revelation that Christ had all along picked America as His chosen land, the place where He would return to reign for a thousand years, a millennium.

Indeed, millennialism was on the minds of quite a few people during the first half of the nineteenth century. The Second Great Awakening of the 1830s resulted from new ideas about Christianity, the sinner's relation to God, Christ's role in redemption, and the millennium. The great spokesman of the Second

Preaching that personal redemption and individual salvation were attainable by all, the evangelical Charles Grandison Finney led a religious revival in the Northeast in the 1820s and 1830s. The Second Great Awakening, as this revival was called, helped spark the abolitionist and social reform movements of the nineteenth century. *(Brown Brothers)*

Great Awakening was Charles Grandison Finney, who preached to the farmers and shopkeepers of New York, particularly upstate New York along the Erie Canal. Here were towns and cities undergoing tremendous change. Rochester, for example, experienced a population explosion, new trade, and business; it was a bustling atmosphere with young people willing to work hard, intent on achieving material success.

Finney, like Edwards and Whitefield of a century earlier, was a grand orator who could hold the audience of the hopeful in the palms of his oratorical hands as he re-created hell and suffering for sin, then painted a picture of redemption and heavenly success. For Finney, the sinner can achieve salvation completely by his or her own means. Just as the businessman needs to change his lifestyle to succeed, so the sinner needs to change her lifestyle to reach heaven. But before death bids us to such joy, the redeemed sinner, having made the conscious decision to reject sin for salvation, will enjoy signs of heaven on earth. Material prosperity awaits the person who chooses to be saved. Gone from Finney's sermons were God's anger and the damnation of sinful souls, born in sin, predestined for hell.

The preceding century had taught rational Americans that God left the choice of salvation entirely in each person's hands. Self-reliant, independent, freedom-loving Americans could experience do-it-yourself salvation. Conversion does not come from some hidden, unexpected source in response to one's appeal to God for help. Conversion is a conscious decision to succeed, rather like the choice to go into business.

One can imagine the enthusiastic response to such a doctrine of salvation and success open to all with very little inconvenience. The people of the industrializing North, the people of Rochester, embraced such ideas and put their hearts to the grindstone to learn to be "perfect, as Christ is perfect." Christ's perfection, of course, resulted in terrible suffering and death. But the atmosphere of business, materialism, success, Americanism, and free will of the 1830s would hardly accommodate such a negative theology. Life had changed during eighteen hundred years, and so too had the church, the elect, sin, and salvation. Gone were the days of priests, confessions, the damned, God's wrath, suffering, and the cross. The Second Great Awakening and consequent evangelical movements gave the American in approaching the afterlife what he had always had in life: free choice, self-reliance, independence.

Religious social movements in America from the 1730s to the 1830s possessed a peculiar irony. Americans responded to anxiety and uncertainty by allowing themselves to be caught up in a movement involving large groups of people who conformed to the requirements of the majority, and who accepted the teachings of the religious spokesman. Yet these teachings tended to contradict the nature and function of the revival itself. Social movements sweep up the individual, make him a part of a whole, force him to relinquish some of his freedom, demand the merging of his identity with that of the group. The sacrifice of the individual earns rich dividends in return. By becoming a part of the group, one feels more an individual. By giving up freedom to act on one's own, one achieves the freedom of salvation. Free will is elusive in theory, yet in practice one can revel in it. And best of all, one can agree that the teachings of Christ—

humility, peace, acceptance, poverty—are best realized in the pride of conversion, the violence of reform, the pursuit of progress, and the rich signs of salvation.

Religious Movements 1830s–1870

Following the Second Great Awakening, the religious movements of the antebellum period through the Civil War focused much of their energies on moral and religious reform. Although they may have differed over approach to reform, there was little difference in general objectives: moral reform. Moral reform meant social reform, and social reform meant a moral *reformation* of American society. It did not matter that moral reform might lead to armed conflict or that women remained disenfranchised and without direct political power. Abolition, temperance, and other moral reforms were part of the broader effort to attain Christ-like perfection, the final goal of moral reform.

A national reform impulse did not suddenly appear in 1830. Reform efforts had been ongoing for decades, but beginning in the 1830s reform took on newer approaches, emphases, techniques, and ideas. The numerous immediate antecedents of the antebellum reforms can be found in the Second Great Awakening, that period of early-nineteenth-century American history characterized by revivals as the primary means of Christianizing the growing U.S. population. By the 1830s, reform had assumed the characteristics that would distinguish it for the next several decades. Whereas most of the revivals and campaigns of the Second Great Awakening began locally and did not expand to become a coherent national movement, the antebellum and post–Civil War reforms became national—national in vision, national in goals, and national in operations. Most important, they had national implications.

Abolition of Slavery

Abolitionism provides an excellent example of how a regional idea became a national reform crusade and changed American society. Although the Religious Society of Friends, or Quakers, had long opposed slavery, the religious revivals of the 1820s inspired many new followers, including Theodore Dwight Weld, William Lloyd Garrison, and Arthur and Lewis Tappan, to take up the cause of "immediate emancipation." Garrison, the Tappan brothers, and sixty others gathered in Philadelphia to found the American Anti-Slavery Society in December 1833. The abolitionists wanted to expunge the entire nation of evil in hopes of redeeming and saving the nation. Although by the 1830s slavery was restricted to Southern states, Northern abolitionists argued that the guilt for slavery was nationwide. Since guilt was national, repentance should also be national. "The highest obligations [are] resting upon the people of the free States to remove slavery by moral and political action," the American Anti-Slavery Society declared at its founding, "as prescribed in the Constitution of the United States."

To aid the cause, leading reformers sought the support of others around the country through various publications such as Garrison's newspaper, *The Liberator*, or in political tracts, and through state antislavery societies. The American Anti-Slavery Society received significant moral and financial support from African-American communities in the North and set up hundreds of branches throughout the free states. But Garrison's provocative call to discard the Constitution because it sanctioned slavery and his support of women's rights alienated the more conservative members of the movement, leading to harmful factionalism over the means to ending slavery.

Another abolitionist, Theodore Weld, promoted the "perfectionist" wing of the revival movement in a much different fashion than Garrison. Weld, a follower of the American clergyman-educator Charles Grandison Finney, left a career as a revivalist and temperance advocate and in 1832 enrolled at Lane Seminary in Cincinnati, Ohio, for more formal ministerial training. Most of the student body followed Weld's

Founder of the antislavery newspaper *The Liberator* in 1831, William Lloyd Garrison was one of the nation's foremost abolitionists. *(Brown Brothers)*

lead by converting to his abolitionist principles and, together, began working with the city's black community. When the trustees of the school ordered Weld and his followers to cease their activism, they refused and instead moved to Oberlin College, where Finney was teaching theology. Founded in 1833 by New England Congregationalists, the college had already gained a reputation as the center for social radicalism and soon became the first coeducational and interracial American institution of higher learning. (Ohio saw the establishment of over a dozen colleges by evangelical churches in the first half of the nineteenth century.) Weld became a widely known organizer and publicist for the antislavery cause in the Ohio and New York region, helping to bring pressure to bear on the federal government and Northern opinion about slavery.

Impact of Slavery on Organized Religion

Slavery opened the rift between Northern and Southern Christians very slowly at first. In 1852, it was ripped asunder with the publication of Harriet Beecher Stowe's book *Uncle Tom's Cabin* in which she indicted organized Christianity for its failure to overthrow the "injustice and cruelty" of slavery. The use of biblical language and references in discussions of slavery soon became common ideological currency. It was therefore not surprising that Americans often described the Civil War in biblical terms or viewed it as a religious event, or at least one with religious overtones.

Antislavery sentiment was either localized or regional, or did not cause lasting schisms among the "liturgical churches"—the Roman Catholic, Lutheran, and Episcopalian churches. Congregationalist and Unitarian churches were scarce in the South and remained largely unaffected as a result. But the three large national evangelical denominations—the Baptist, Methodist, and Presbyterian churches—all split over the issue. The formation of the Southern Baptist Convention in 1845 created little stir, in part because it was a decentralized denomination from the outset, and the split occurred rather quietly. The Methodists, who initially followed English religious leader John Wesley's antislavery teachings, tolerated slaveholding bishops when they first came on the scene in the 1830s, but the denomination finally split over that particular issue in 1845.

The Presbyterians faced a more complicated problem. By the 1830s, the denomination had begun to splinter into two factions over the issues regarding missionary work and doctrinal matters. The "liberal" ideas, given shape by American theologian Nathaniel William Taylor, led to the formation of a "New School" theological stance compatible with the activist spirit of revivalism. The liberal New School favored interdenominational benevolent societies aimed at reform, while the conservative "Old School" followers favored tradition, including keeping women from holding power in the church and the idea of predestination. The Old School followers gained control of the church's General Assembly in 1837 and ousted four New School synods, which immediately held their own assembly, leaving the church split along these ideological lines.

The Northern and Southern wings each split over slavery. The New School, mostly rooted in the North, divided in 1857 after some leaders took a series of

increasingly stronger antislavery positions. The Old School, more Southern-based and conservative, split in 1861, leaving the Presbyterian denomination divided into four different assemblies. After the Civil War, the various factions reformed along sectional lines, creating Northern and Southern Presbyterian churches that finally reconciled and merged in 1984.

"Rum and Romanism"

Although the Protestants may have turned against one another over slavery, they did unite during the 1830s over one issue: their stand against Catholicism. In the early days of the Republic, Catholicism presented little problem because there were so few Catholics in the United States. Yet to be a good Protestant in the colonial and early Republic periods meant a person had to be something of an anti-Catholic. Protestantism, after all, came into being as a protest against the alleged corruption and evil of the Roman Catholic Church. Beginning in the 1830s, as the number of Catholics, particularly Irish Catholics, increased in large part because of immigration, anti-Catholicism, and with it antiliquor sentiment, grew in response. To American Protestants and nativists (those opposed to immigrants), the evils of alcohol and Catholicism—"rum and Romanism," as they were derisively called—went hand in hand.

Protestants responded with a combination of evangelism and temperance. Reverend Lyman Beecher, pastor of the Congregational Church in Litchfield, Connecticut, and one of the most eminent preachers of his day, launched one of the first attacks of this reform era on intemperance in 1825 by calling for total abstinence as the only solution to drinking and drunkenness. His six sermons on intemperance were printed and widely distributed over the next several years. After that, it was only a short step from the arguments for abstinence to the demands for prohibition as the best means of saving the American family in particular and American society as a whole. The rise of abolitionism in the 1830s and 1840s and the need to court the immigrant vote in the 1850s overtook the temperance movement and pushed it to the background until after the Civil War.

Protecting the Home and Family

As many as two-thirds of those converted during the Second Great Awakening were women. But just as quickly as their membership numbers rose, their power in public arenas eroded. By the time of the Civil War, public forums for women were all but eliminated and their sphere of influence had been largely reduced to the immediate household and issues directly affecting it. Through their participation in Sunday schools, missionary alliances, and benevolent societies, women frequently exercised powers denied to them in other public forums. At a time when they could not openly protest their subjugation and were denied the right to vote, involvement in evangelical reform movements provided a means of asserting their autonomy. It was not until after the Civil War that women would regroup and demand rights for themselves.

Although the majority of church members were women, paradoxically the church disenfranchised women and stripped them of power. But that did not drive women away. They stayed because they shared the church's perceived role of transmitting republican and moral values to the next generation and because it offered them moral support as they coped with the great difficulties associated with motherhood. Their influence was felt in the message from the pulpit. The portrayals of Jesus and God evolved from one of Christ as king and magistrate to one of a gentle Jesus and a loving and forgiving God.

As the economy industrialized and society urbanized, married middle-class women found they had fewer opportunities to exert themselves than their single counterparts and increasingly became relegated to nonincome-generating work. They embraced their new roles as provider and protector for piety and domestic purity. Their evangelical values made it possible for them to better serve as guardians of morality, purity, culture, and patriotism, collectively known as "domestic feminism." As they lost power in the public sphere, they embraced their role as "great sufferers," which allowed them to invoke the suffering of Christ on the cross and the grievous loss and sacrifice of his mother to their benefit. They took advantage of the tradeoff to exert tighter control over household activities and assert themselves in sexual matters, such as having a say in the number of children they had.

Domestic feminism extended to the schoolroom and benevolent societies. Catherine Beecher, daughter of Lyman Beecher, argued that Christian perfectionism could be attained when children received the benefits of a sound Christian education. Although she was instrumental in opening the teaching profession to women, she also supported the notion of less compensation for women than men received. Mary Lyon founded Mount Holyoke Female Seminary in 1837 as a school for women and preached revivals on religious subjects. Mount Holyoke trained hundreds of missionaries and teachers who fanned out across the

country, carrying forth the values instilled in them at the school.

With few other outlets for their energy available to them, middle-class women became deeply involved in benevolent reform. As part of their work to eliminate prostitution, alcoholism, and other threats to their men and society, they acquired political and organizational skills and handled money and property on behalf of their societies. Some published stories about their evangelical experiences, while others hit the revival circuit to speak. In the home and at public meetings, they discussed issues such as slavery or closing businesses on Sunday. Many men initially accepted the idea that women should have strong opinions on some public questions because women were long considered the guardians of Christian and republican ideas.

Abolitionism proved the first great forum for women to accumulate and exercise power. The American Anti-Slavery Society attracted a great deal of participation by women. Women organized local and state-level Female Anti-Slavery Societies, which gave them opportunities to organize and lead. The abolition movement provided the first taste of autonomy for many of them. Feminists and women's rights leaders such as Sarah and Angelina Grimké, Margaret Fuller, Lucretia Mott, and Lucy Stone all began their women's rights work while campaigning for abolition. But William Lloyd Garrison's support of women's rights and his confrontational manner led to a falling-out within the American Anti-Slavery Society in 1840 that hurt the feminist cause. The American Anti-Slavery Society split over whether it was proper for women to speak publicly to audiences containing both men and women. The more conservative members, including many clergy, withdrew and formed the American and Foreign Anti-Slavery Society, in which the role of women was more restricted. Despite this setback, participation in abolitionism and other reform efforts nonetheless increased female empowerment.

With the ending of the Civil War and slavery, temperance reemerged as the most pressing reform issue. This gave women a new opportunity to assert themselves as never before by expanding the focus of their benevolent societies. The Woman's Christian Temperance Union (WCTU), formed in 1874, initially concerned itself only with eliminating alcohol but became a leader and supporter of women's suffrage and other reform efforts. Several of its members took the energy they had poured into abolitionism and focused it on gaining a political voice in hopes of protecting immigrants and lower-class women and children being exploited by the industrial revolution. Their work and that of others laid the groundwork for the Progressive reformers, who shared many of the same Protestant values and employed the techniques pioneered by the mid-nineteenth-century reformers.

Religious Movements
1870s–Present

After the Civil War, the dominant social groups in the United States were primarily white, native-born, and small-town or rural. Imbued with an aura of respectability, they were institutionalized to such an extent that regular attendance in a moderate Protestant denomination—Methodist, Presbyterian, Congregational, and in some regions Lutheran or Baptist—signified not only religious devotion but also an opportunity to establish social networks and demonstrate civic involvement, which was so essential for those aspiring to positions of authority in business or public life. Other Protestant sects, practiced primarily by the rural poor and people of color, and Roman Catholicism, practiced primarily by the urban working class, were variously marginalized or suppressed. Non-Christian religious traditions were ignored. During the twentieth century, however, a number of social movements mobilized, with little denominational support, to challenge the hegemonic status of moderate Protestantism and champion the religious traditions of the disenfranchised.

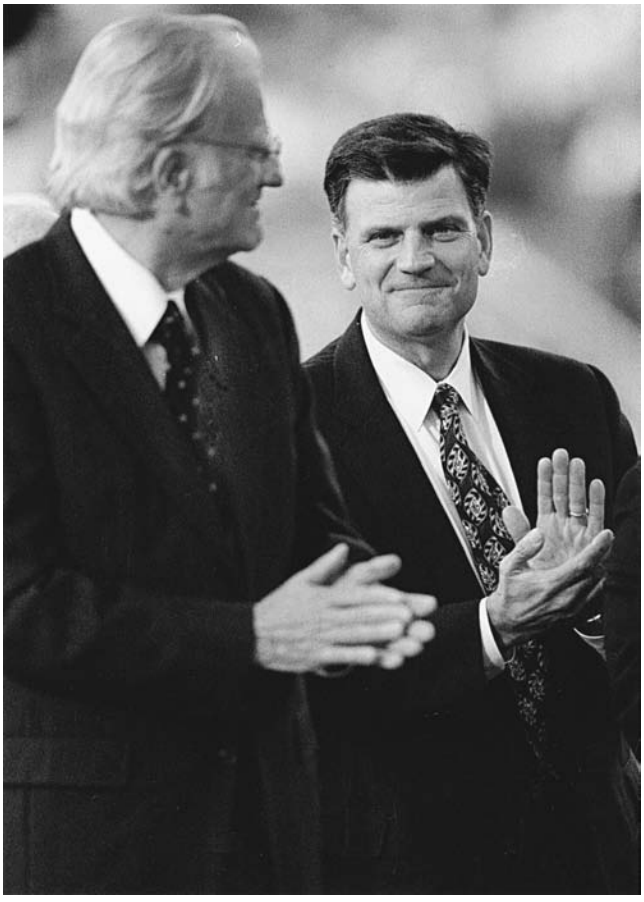
Conservative Christian Movements

The Fundamentalist Movement

During the 1880s and 1890s, many working-class, poor, and rural believers separated from the Methodist-Presbyterian-Congregational mainstream of American Protestantism, believing that their increasing attention to liberalism and commitment to social justice hindered or even perverted the true goals of Christianity: "evangelizing," or converting nonbelievers, and attaining "holiness," or spiritual perfection. In 1895, Phineas F. Bresee consolidated several such groups into the Church of the Nazarene, the most prominent of the new Holiness denominations.

During the 1910s and 1920s, concerns over the increasing encroachment of modernism led many Protestants, mostly from evangelical and Holiness denominations, to affirm that they were "fundamentalists," aggressively adhering to "fundamentals" of the Christian faith that soon expanded from a short list of doctrinal positions (the Virgin Birth, the Blood Atonement, and so on) to disdain textual criticism of biblical texts and embrace a more or less rigid interpretation of the Bible as the literal Word of God. During the first twenty years of the century, they mobilized against all sorts of developments they deemed public ills, from alcohol consumption to the cinema, but especially against the theory of evolution, which they condemned as atheistic and subversive. The trial of John Scopes in 1925, in which a Tennessee schoolteacher was arrested for teaching evolution, gained national recognition for the fundamentalist movement, but cast it as backward, superstitious, and rigid, causing fundamentalists to shy away from political activism for the next half-century. There were only a few fundamentalist groups with much impact outside their own denominations until the Cold War, when the association of Communism and the forces of Satan made a new mobilization imperative.

During the 1950s, mobilization occurred most frequently in high schools and colleges. The Intervarsity Christian Fellowship, a fundamentalist collegiate group founded in England in 1877, entered the United States in 1941 and by 1950 had chapters on nearly 500 college campuses. Campus Crusade for Christ, founded by Bill Bright in 1951, brought the twin principles of evangelization and spiritual perfection to almost every college campus in the United States through small peer-led Bible studies and "witnessing," or one-on-one proselytization. Meanwhile, Youth for Christ, founded in 1944, virtually abandoned its early outreach to soldiers stationed overseas to form "Campus Life" groups at thousands of high schools and junior highs. Adult men could join the Christian Businessman's Committee, founded in 1938,



Rev. Billy Graham applauds with his son Franklin Graham during a religious crusade in North Carolina in 1996. The elder Graham was the nation's most prominent evangelist for more than half a century. *(AP Wide World Photos)*

and the Full Gospel Business Men's Fellowship, founded in 1952, which provided not only evangelization and the quest for Christian perfection, but also social networking that mirrored the Chambers of Congress and Toastmasters popular in mainstream society, and the assurance that God was a capitalist.

Although fundamentalist churches remained small and deeply suspicious of the "world," with outreach mostly to the disenfranchised, dozens of parachurch organizations, beginning in 1950 with the Billy Graham Evangelistic Association, introduced the twin goals of evangelization and Christian perfection to a huge mainstream audience. They even managed to redefine "Christian" to refer only to those who have been "born again"—that is, experienced a spiritual transformation through a personal relationship with Jesus. Intimate of movie stars and presidents, Billy Graham had the uncanny ability to popularize his moderate evangelical message through television and radio appearances, a series of well-received evangelistic films, and many local, stadium-filling crusades. He was followed by dozens of evangelists working primarily through the new medium of television; only Robert Schuller matched his charisma and moderate message, but Kenneth Copeland, Jimmy Swaggart, Benny Hinn, John Hagee, Ron Parsley, and Pat Robertson all drew adherents. The excesses of the 1970s and 1980s, ranging from sexual improprieties to money laundering to extreme claims (such as Oral Roberts' threat that God would kill him unless he raised $8 million) sent televangelism into a decline survived by only the most tenacious. Yet televangelists still managed to imbue local fundamentalist Christians with a sense of community that transcended denominational and doctrinal differences, mobilizing them into a formidable social force that has endured into the twenty-first century.

The Charismatic Movement

Glossolalia, or speaking in unknown tongues during spiritual ecstasy, is common to many religious traditions, but prior to the twentieth century it occurred only rarely in Christianity. The modern charismatic movement associates speaking in tongues and other spiritual gifts (interpreting tongues, prophecy, and so on) with baptism in the Holy Ghost, the second work of grace in the Holiness tradition and either a requirement for salvation or a sign of Christian perfection. It began in January 1901, when several students at Charles Parham's Bethel Bible School in Topeka, Kansas, began speaking in tongues. Lauding the event as evidence of the restoration of the true Christianity practiced by the Apostles, Parham closed his school and began amassing followers in the Apostolic Faith Missions, mostly among the disenfranchised poor and nonwhite in the southern United States. Little glossolalia recurred until 1906, when one such mission on Azusa Street in Los Angeles experienced the "new Pentecost" under the direction of William J. Seymour, and the signs and wonders continued for three years. In the wake of Azusa Street, many new "Pentecostal" denominations were founded, including the Church of God in Christ, the International Church of the Foursquare Gospel, and the Assemblies of God, but just as often adherents remained within their own Holiness or Baptist denominations and sought baptism in the Holy Ghost at camp meetings and revivals. Today the various Pentecostal denominations and parachurch organizations have between 100 million and 400 million adherents world-

wide; they have seen considerable success in Europe, sub-Saharan Africa, and especially in Latin America, where Brazil may reach a Pentecostal majority within the next decade.

In beliefs and practices, Pentecostalism rarely strayed far from its Holiness roots and rarely attracted the attention of mainstream Christianity, but in 1967 faculty and students of Duquesne University established the Catholic Charismatic Movement, incorporating glossolalia, and its attendant signs and wonders, into traditional Roman Catholic devotions. Small groups of Lutherans, Presbyterians, and others followed, until today an estimated 55 million members of mainstream Protestant denominations belong to the Charismatic Revival.

The Religious Right

The Religious Right of the contemporary United States grew out of the fundamentalist movement in several denominational families, especially Holiness, Baptist, and Pentecostal, mobilized through televangelism and a number of parachurch groups of the 1980s, notably Jerry Falwell's Moral Majority, Pat Robertson's Christian Coalition, and James Dobson's Focus on the Family. It combined fundamentalist beliefs with a hitherto uncommon commitment to political activism, and it used state-of-the-art media saturation to mobilize Christians into an apocalyptic struggle between God and Satan. The goal of the Religious Right was to "take back America" through specific political action: defeating or repelling gay rights and prochoice legislation, forbidding the teaching of evolution and sex education, and legislating fundamentalist Christianity as the official religion of the United States. In the twenty-first century, the Religious Right continues to play a role in politics, lobbying for conservative candidates and legislation and fighting to overturn Supreme Court decisions that allow abortion and ban prayer in public schools.

The Traditional Catholic Movement

Although individual Catholics have become involved in many social movements, both religious and secular, few such movements have been associated with the Roman Catholic Church itself; even the pro-life movement mobilizes primarily through Protestant fundamentalists. A notable exception can be found in the various quasi-denominations, individual churches, and parachurch organizations that grew up to protest the modernization of the Church after Vatican I (1869), and especially after the modernization of the Mass in Vatican II (1962–1965). Objecting to the increased participation of the congregation, the new accessibility of the priesthood, the increased fellowship with Protestants and members of non-Christian religions, and especially the institutionalization of a vernacular Mass, "traditional Catholics" are small in numbers but extremely media-savvy, utilizing not only television and radio but the Internet, and they are highly influential, especially among their conservative brethren. They vary in their attitudes toward the Vatican, from sadly concluding that the current papacy is misguided to asserting that the last true Pope was Pius XII, and that the Antichrist is sitting on the throne. One group even has its own College of Cardinals, which has elected a Pius XIII.

Ecumenical Christian Movements

During the last half of the twentieth century, religious observation ceased to play its earlier role in fostering social relations in the community: one's social prestige or network of contacts did not increase as a result of attendance. Conservative Protestants attended anyway, as they had an apocalyptic enemy to fight, but mainstream Protestants, Methodists, Presbyterians, Congregationalists, and some Baptists and Lutherans faced a staggering loss of numbers. They founded several ecumenical groups, including National Council of Churches and the World Council of Churches, to encourage fraternity among their remaining members and asserted that denominations were divided more by tradition than by beliefs and practices. Many such groups, such as Bread for the World, Habitat for Humanity, World Vision International, and Faith in Practice, replicate moderate Protestantism's commitment to social activism, fighting poverty, hunger, and homelessness with often the same degree of media savvy that characterizes fundamentalist televangelism. Only a few, such as the Taizé Community in France, are primarily concerned with spiritual development.

Eastern Religions

Hinduism and Hinduism-Based Movements

In 2000, there were 1.2 million practicing Hindus in the United States; before 1965, when strict immigration laws limited Asian immigration, there were perhaps 100,000. Nevertheless, social movements based on Hindu beliefs and practices have been mobilizing Americans for over a century, since Swami Vivekananda founded the Vedanta Society in 1894. In 1920, Paramahansa Yogananda founded the Self-Realization

Fellowship in Los Angeles. Perhaps the most successful of all the Hindu-based movements, the Self-Realization Fellowship combined traditional krija yoga with jazz-age mental science to reach middle-class drawing rooms across the United States and Europe. After the immigration quotas were eliminated in 1965, many South Asian *gurus,* or independent religious leaders, saddened by what they considered the deplorable spiritual health of the West, felt called by God to reach out to His children in the New World; among the most famous were Haidakhan Samaj, Sri Satchinanda, Yogi Amrit Desai, and Gurudeva Sivaija Subramaniyaswami. Soon many groups, based in Hinduism but also including elements from other religions, Western parapsychology and mind science, and the 1970s New Age, were founded, drawing followers from among not only white middle-class intellectuals but also the disenfranchised.

The most controversial of the Hindu-based movements, the International Society for Krishna Consciousness (ISKCON), was founded in 1966 when Swami Srila Prabhupada came to America to win followers for the God Krishna. While thoroughly conventional in India, his practices of chanting, communal living, and aggressive begging were foreign to the West, and though its adherents, known as "Hare Krishnas," never numbered more than a few thousand, they became a primary target of the anti-cult movement of the 1970s. In 1988, when a scurrilous expose by John Hubner and Lindsey Gruson, *Monkey on a Stick: Murder, Madness, and the Hare Krishnas,* hit best-seller lists, parents hired cult deprogrammers to "rescue" young converts, and followers were accused of a variety of abuses, including brainwashing.

Buddhism and Buddhism-Based Movements

The many varieties of Buddhism have between 3 million and 6 million adherents in the United States, but again, a much larger number of persons have been influenced by social movements based on Buddhist teachings. In the 1950s, members of the influential Beat Generation began examining Zen and Tibetan Buddhist texts, either in translation or through the popularizations of Alan Watts and D.T. Suzuki, until a passing acquaintance with Buddhism became mandatory in artistic and literary circles. Since Buddhism has always been propagated through family and monastic devotion rather than a hierarchical ministry, it was amenable to those who wished to explore more deeply through individual reading or association with a local spiritual group. By the 1970s, Tibetan and Zen Buddhism were flourishing, and other Mahayana sects that were obscure in Asia, such as Reiyukai, enjoyed an enormous popularity.

As with Hinduism, some of the Buddhist-based movements have been subject to controversy, especially Nichiren Shoshu, which was originally practiced by Japanese immigrants. It became "Americanized" through missionary activity in 1966 and had as many as 200,000 followers by the 1970s.

Alternative Movements

African-American Religious Movements

Immediately after World War I and extending through the Depression, African Americans who had recently immigrated from the South to the urban centers of the North, especially New York, Philadelphia, Detroit, Chicago, and also to Los Angeles, often abandoned or decreased their affiliation with their home Baptist, Methodist, and Holiness to embrace a wide variety of alternative religious movements. Although some, such as the various Afro-Israelite and black Muslim groups, rejected Christian tenets altogether in favor of a nominal affiliation with Judaism or Islam, and others, such as vodoun, worked within and around elements of folk Catholicism, most maintained the belief system and practices of traditional African-American Protestantism, merely adducing that their idiosyncrasies were the fulfillment of Scripture

Perhaps we can explain the sudden availability of alternative religious movements, and their sudden popularity, through the disillusionment that set in after the migration northward failed to alleviate institutionalized racism or significantly increase economic prosperity. The alternative movements offered a Promised Land that was not some distant heaven, but literally, physically on earth. Marcus Garvey's Universal Negro Improvement Association (UNIA) found it in Africa and sought mass repatriation for all Africans exiled in the Americas. The Rastafarians specified Ethiopia and petitioned the Messiah, Emperor Haile Selasse, to admit them into Paradise. Similarly, alternative religious movements offered a God who was not distant, but immediate, accessible, flesh and blood: Father Hurley in Tennessee, Bishop St. John the Vine in Baltimore, John the Revelator in New York, and Sweet Daddy Grace in Oakland all assured believers that they were literally Jesus Christ, God the Father, or both. The most successful, Father Divine, "God visibilated," established the literal Heaven in Sayville, Long Island, as well as many subsidiary heavens in urban centers across the United States. By 1935, he had gathered perhaps a million literal, phys-

ical angels, both black and white, to practice celibacy and entrepreneurship, and to greet each other with what would become a catchphrase of the day, "Peace—it's wonderful."

The rage for alternative African-American religious movements did not survive the Depression; Father Divine's Peace Mission Movement endures, but barely, under the leadership of the aging Mother Divine. Several sects of Afro-Israelites and black Muslims remain, but in idiosyncratic, racist configurations unlikely to win many followers.

Cults and New Religions

New religious groups, based on the dominant Christianity, on some other religion, or on the vision of a single iconoclast, are constantly springing up in the Western world. A few, such as the Jehovah's Witnesses, the Church of Christ, Scientist, and the Church of Jesus Christ of Latter-day Saints, have experienced a numerical success rivaling mainstream denominations. Most of them, however, never attract more than a few hundred members; at best they form fascinating but idiosyncratic byways in American religious history. During the early 1970s, some of these groups attracted the attention of the mainstream media, initiating a moral panic to rival the Satanic ritual abuse scare of the 1980s. Called "cults" not out of any definitional integrity but to underscore their aura of secrecy and threat, they were subject to a multitude of lurid tell-all books, endless discussion in the tabloids and on the talk-show circuit, police alerts and task forces, and eventually an army of professional anticult activists, including deprogrammers who abducted converts and attempted to restore them to "sanity." During the middle and late 1970s, the federal and local government often stepped in with lawsuits, punitive legislation, and even armed intervention.

Although the new religions were subject to abuses, like all religious groups, and emotionally damaged and unstable persons did form a percentage of the leadership, the tales of brainwashing, intimidation, physical and sexual abuse, and violence were vastly exaggerated. Among the most often excoriated groups were the Children of God; the Church of Scientology; the Unification Church of Reverend Sun Myung Moon; Nichiren Shoshu; and the International Society for Krishna Consciousness (1959). But guidebooks enumerated hundreds of "cults," including extremely obscure mental science organizations that had been plodding along with a few dozen members for over a century. Even mainstream Christian denominations got into the act, with Protestant fundamentalists and Roman Catholics defining each other as mind-control cults and attempting to deprogram each other's converts.

The reasons for the sudden mania are obscure, but one might suggest the strategic appearance of many new alternative religious movements on college campuses, which attempted to emulate the success of Campus Crusade for Christ and the Intervarsity Christian Fellowship (as well as Newman Centers and Hillel), in the early 1970s, just as the last of the baby boomers began college. Parents who had already experienced the disenfranchisement of the hippie generation might be aghast at tales of innocuous religious exploration and sensitive to any attempt to foster a communal identity.

The mass suicide of the People's Temple in 1978, a utopian commune founded by the Reverend Jim Jones, effectively ended the wide-scale proselytization efforts of the new religions, especially on college campuses. A few new religions, such as David Koresh's Branch Davidians and Heaven's Gate, would continue to make the news if they went terribly wrong, but the anti-cult mania was over.

The New Age

The New Age refers to a vast number of groups and individuals with syncretic interest in a wide range of religious experience, including Christian and Jewish mysticism, Buddhist and Hindu practices, Sufism, shamanism, and global mythology, as well as many interests that are not religious or necessarily even spiritual, such as vegetarianism, meditation, holistic healing, astrology, environmentalism, UFOs, New Age music, reincarnation, parapsychology, and political activism. Even the movement to "free Tibet"—that is, to restore Tibet as a politically autonomous entity distinct from China—is often labeled New Age. Practitioners often belong to mainstream Christian denominations, but they combine a wide and eclectic reading in various forms of mysticism, Eastern religions, books by New Age professionals, and the American mental science tradition. They may be concerned almost exclusively in increasing their individual spiritual awareness, or they may be thoroughly committed to the spiritual transformation of global society. Although there are a few organizations, such as the Aetherius Society and est, most New Age activity occurs through loose confederations of associates who

gather at New Age bookstores, concerts, or holistic healing centers.

Neopaganism

Though often labeled New Age, and complicit with its expansive and eclectic orientation, neopagans practice specific religious traditions. They may call themselves Wiccans, witches, or simply pagans. There are several distinctive branches, but most trace their lineage to Gerald Gardner, who in the 1930s claimed to have discovered and restored the pre-Christian earth-based religion of England. Although theoretically any neopagan religion is open to anyone, a great emphasis is placed on ancestral practices. Thus, Celtic, Norse, or Slavic traditions draw members primarily from individuals of those ethnic backgrounds, whereas persons of African ancestry are drawn primarily to the Afro-Caribbean syncretic religions of vodoun and Santeria.

Social Gospel Movement

The Social Gospel movement, also known as Christian socialism until after 1907, was a moral reform movement of the late nineteenth and early twentieth centuries that provided the moral underpinnings for the Progressive movement. Social Gospel represented the intersection of Christian activism and social reform with economic theory. The Social Gospel movement was initiated informally by several inner-city clergymen in the Gilded Age who were attempting to draw the working class into their middle-class congregations. The effort spread to secular reform leaders interested in securing social justice for the poor by applying the Gospel to their social and economic problems.

The Roots of the Movement

The roots of the Social Gospel movement are diverse. Similar efforts at aiding the working class had been underway for some time in Victorian England and in Germany. The Social Gospel movement drew heavily upon European ideas, most especially the British strain of Christian socialism and also the Fabian movement, which called for gradual rather than revolutionary and violent means for spreading Socialist principles. Europeans themselves delved into the past for ideas. The medieval principle that social, economic, and political theory comprised Christian ethics enlightened Christian socialism reform efforts.

From Germany the Americans borrowed nearly its entire biblical and theological foundation as well as the historical view of economic theory, especially from Marxism. The writings of Albrecht Ritschl and Adolph von Harnack gave the rising Social Christian movement and its advanced social legislation in Germany and Switzerland its intellectual heft. Ritschl provided the overarching idea for the movement with his Jesus-centered, anti-metaphysical theology of the Kingdom of God. His theology stressed ethics and the community of man. A leading student of Ritschl's ideas, von Harnack articulated many of these ideas more clearly by attacking esoteric intellectual exercises and other shortcomings of the church leaders.

Although its European roots were substantial and vital, its American ones were even more so. The Social Gospel movement was part of a larger religious reform movement in the United States that predated the Civil War. It had its foundation in American Puritanism and its powerful drive to shape and possibly remake society. The Second Great Awakening and the antislavery movements of the antebellum period present clear evidence of these tendencies. Abolitionism had harnessed the energy and resources of the church and asked its followers to subordinate other interests to address the great moral question of the day, slavery. The Social Gospel movement would ask the same of its adherents.

The Social Gospel movement sought to overcome the attitudes created by laissez-faire economics of the period and Social Darwinism. The Social Gospel movement emerged during the Gilded Age, when a handful of men like John D. Rockefeller and Andrew Carnegie amassed great sums of wealth from the labor of others. Many preachers praised the acquisition of wealth from the pulpit, or like Henry Ward Beecher, pointed out that it demonstrated their high moral standing, whereas poverty was equated with sin. This view of wealth and poverty gained "scientific" credence with the emergence of the theory of Social Darwinism. Herbert Spencer in Britain and William Graham Sumner in the United States applied Charles Darwin's scientific theories of evolution through struggle and natural selection of the fittest to human societies. Sumner, a Yale sociologist and former minister, developed arguments about evolutionary determinism used by politicians in their debate against social reform and governmental intervention on behalf of the poor. Instead, he argued that a work-

oriented moralism and the evolutionary process offered the only hope for society.

Henry Ward Beecher spoke favorably of the theory of evolution and Social Darwinism from his influential pulpit at Plymouth Church (Congregational) in Brooklyn, New York. Beecher, along with other preachers who shared his conservative values, defended the truth of the Gospel from attack by Darwinists by assimilating evolutionary views without harming or undermining Christian faith. Beecher and other conservatives linked creation as described in Genesis to Darwin's developmental theories, and sought to make the Bible more relevant to current conditions. Ironically, by doing so the conservatives helped to liberate organized religion from its constrictive past and paved the way for the liberal Social Gospel.

Socialism and New Theology

In the decades following the Civil War, some ministers and other Christian spokesmen around the country began to question whether the free enterprise system would automatically solve the nation's problems. Christianity and the church also came under some criticism for its failure to understand and defend the working class. Professor John Bascom of Williams College, who, like many contemporaries, held the poor in equal contempt, nonetheless criticized the conservatism of the Protestant pulpit and questioned the effect of the free competition on the workers. While at Williams, Bascom taught Washington Gladden, "the father of the American Social Gospel." Bascom's position evolved, and he later embraced the "Kingdom theology" of the Social Gospel movement first put forth by the Reverend Jesse Henry Jones, a Boston Congregationalist.

Jones blended Christianity with socialism. He founded the Christian Labor Union in 1872 and was editor of its journal, *Equality*, which advocated socialism until its dissolution a few years later in 1878. He attacked Beecher's positions and defended a labor theory of value. He also called for an eight-hour workday at a time when most laborers worked twelve to fourteen hours a day. In his book *The Kingdom of Heaven* (1871), Jones discussed a perfect Christian society on earth made up of independent socialistic communities. Other ministers like William Dwight Porter Bliss and George Herron went further still by leaving the pulpit and becoming Socialists.

In contrast to Christian socialism, another Congregationalist, Theodore Munger, developed the "New Theology" as the basis for a non-Socialist approach to the Social Gospel. Munger drew upon the writings of Horace Bushnell, who directly influenced several fellow American thinkers. Bushnell, who wrote and ministered in the North Congregational Church in Hartford, Connecticut, from the 1830s to the 1870s, bridged the gap from the old to the new theology and from the Second Great Awakening to the Social Gospel. He fashioned a theology based on Christian experience rather than on any doctrine. The Bible was a historical document, Bushnell said, that offered recorded experiences to be reproduced and emulated. Munger elaborated on these ideas, declaring that Christianity was not a theory but a life and a living process, one centered on Christ. He gave shape to his theory in *The Freedom of Faith* (1883), which acknowledged the rights of the individual but insisted that each person must accomplish his goals within a system that incorporates the good of the family and the nation.

Three American writers in politico-economic theory need to be mentioned along with Jones and Munger. Edward Bellamy, with his utopian novel, *Looking Backward, 2000–1887* (1888), a romance set in a Socialist United States in the year 2000, helped inspire the optimism of the Social Gospel. Henry George started a political movement for a single-tax system with *Progress and Poverty* (1879), his indictment of the American social system. George ran for mayor of New York City in 1886 as an independent candidate and finished second to Democrat Abram Hewitt, outpolling the young Republican candidate, Theodore Roosevelt. Lester Ward, though decidedly too secular in his writings to directly affect the Social Gospel, contributed to the movement by offering sociological arguments against Social Darwinism. He supported state intervention, charity, and other "artificial" devices to deal with the "natural" process that created poverty.

Social Gospel Movement Leaders

A major proponent of the New Theology, Washington Gladden served as pastor of the First Congregational Church of Columbus, Ohio, from 1882 to 1914. His seven years as minister in the industrial city of Springfield, Massachusetts, from 1875 to 1882, where he dealt extensively with the unemployed, had done much to shape his views, but not as much as the Hocking Valley coal strike of 1884 in Ohio. Gladden knew the lengths to which the mine operators were going to break the strike and the union because many of them were in his congregation. They ended the strike only to face another one year later. When the miners won, the manager of the company admitted

OBITUARIES OF WASHINGTON GLADDEN AND BENJAMIN TILLMAN 1918

The obituaries of white minister Dr. Washington Gladden and South Carolina senator Benjamin Tillman were published jointly in the Cleveland Advocate *on July 13, 1918. The newspaper praised Gladden for his belief in racial equality and assailed Tillman for his relentless racism, silenced only by his death.*

There died last week, within twenty-four hours of each other, two men both of whom were known, at least by name, throughout the country. The first to die was Dr. Washington Gladden, the great Congregational minister, author and philosopher, who died at Columbus, Ohio. The second to die was Benjamin R. Tillman, United States Senator from South Carolina. Each had passed the allotted three score and ten.

At one time, when a group of Colored people in Columbus, Ohio, desired to establish a Colored Congregational church they sought Dr. Gladden, pastor of the largest and most notable white Congregational church in Ohio, for encouragement. His reply was this terse sentence: "So long as there are vacant pews in my church I will not favor a separate church for Colored."

Dr. Gladden was never one of those super-enthusiastic agitators for equal rights and privileges for the race, but he was a staunch believer in the Constitution, and regarded that instrument as one which conferred EQUAL RIGHTS upon ALL American citizens, without reference to color or race, and he never, during his eighty-two years of living gave utterance to a single sentence designed to be hurtful to our race. To him the color of a man's skin was simply the design of the same God who gave to him his white skin, and it neither gave to the man special privileges or denied to him equal privileges.

Senator Tillman never lost an opportunity to assail the race; to discredit it in the eyes of the world, until God, in His "mysterious way his wonders to perform," paralyzed the tongue that had denounced a struggling race. For we had done naught to Senator Tillman save to till his soil, and make it possible for him to represent his state in the United States Senate by denial of suffrage. From the far South to the far North, he bitterly traduced us—and for pay. When that vile tongue was touched with paralysis, it was stilled for a while. But when he had partially recovered from his first paralytic stroke, he again resorted to bitter denunciation of a patient, long-suffering, loyal people.
